IN REPLY REFER TO:

UT-050-1610-012J

Dear Reader:

Enclosed is the Proposed Resource Management Plan (PRMP) and Final Environmental Impact Statement (FEIS) for the Richfield Field Office. The Bureau of Land Management (BLM) prepared the PRMP/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort. This PRMP/FEIS provides a framework for the future management direction and appropriate use of BLM-administered lands and resources located in Sanpete, Sevier, Piute, Wayne, and Garfield counties, Utah. The document contains both land use planning decisions and implementation decisions to guide the BLM's management of the Richfield Field Office. The PRMP/FEIS is open for a 30-day review and protest period beginning the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the *Federal Register*.

This PRMP/FEIS has been developed in accordance with the National Environmental Policy Act of 1969 (NEPA) and the Federal Land Policy and Management Act of 1976 (FLPMA). The PRMP/FEIS is largely based on Alternative B, the Preferred Alternative in the Draft RMP and EIS, which was released in October 2007. This PRMP/FEIS contains the proposed plan and potential impacts of the proposed plan. The alternatives presented in the Draft RMP/EIS are also provided for comparative purposes. Major comments received during the public review period of the Draft RMP/EIS and responses to these comments are provided on an attached CD. To aid the reader, substantive changes made between the Draft RMP/EIS and the PRMP/FEIS are described in Chapter 1 and are detailed in Appendix 20.

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this PRMP and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency publishes the Notice of Availability in the *Federal Register*. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment 1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.). To aid in ensuring the completeness of your protest, a protest check list is attached to this letter (labeled as Attachment 2). If your protest does not include all of the elements outlined in 43 CFR 1610.5-2 the BLM will not respond to your protest.

E-mailed and faxed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular or overnight mail postmarked by the close of the protest period.

Under these conditions, the BLM will consider the e-mailed or faxed protest as an advance copy and will afford it full consideration. If you wish to provide the BLM with such advance notification, please direct faxed protests to the attention of Brenda Hudgens-Williams- BLM protest coordinator at 202-452-5112, and e-mailed protests to: Brenda_Hudgens-Williams@blm.gov.

All protests, including the follow-up letter (if e-mailing or faxing) must be in writing and mailed to the following address:

Regular Mail:	Overnight Mail:
Director (210)	Director (210)
Attention: Brenda Williams	Attention: Brenda Williams
P.O. Box 66538	1620 L Street, N.W., Suite 1075
Washington, D.C. 20035	Washington, D.C. 20036

Before including your address, phone number, e-mail address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior.

Upon resolution of all land use plan protests, the BLM will issue an Approved RMP and Record of Decision (ROD). The Approved RMP and ROD will be mailed or made available electronically to all who participated in the planning process and will be available to all parties through the "Planning" page of the BLM national website (*http://www.blm.gov/planning*), or by mail upon request.

Unlike land use planning decisions, implementation decisions are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM's final approval allowing on-the ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations once the BLM resolves the protests to land use planning decisions and issues an Approved RMP and ROD. Implementation-level decisions in the PRMP/FEIS are indicated by *italic text* and an asterisk (*) in Chapter 2. The Approved RMP and ROD will also clearly identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Selma Sierra
Utah State Director

Attachment 1

[Code of Federal Regulations]

TITLE 43--PUBLIC LANDS: INTERIOR

CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR

PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents

Subpart 1610--Resource Management Planning

Sec. 1610.5-2 Protest procedures.

(a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.

(1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.

(2) The protest shall contain:

(i) The name, mailing address, telephone number and interest of the person filing the protest;

(ii) A statement of the issue or issues being protested;

(iii) A statement of the part or parts of the plan or amendment being protested;

(iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and

(v) A concise statement explaining why the State Director's decision is believed to be wrong.

(3) The Director shall promptly render a decision on the protest. The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested.

(b) The decision of the Director shall be the final decision of the Department of the Interior.

Attachment 2

Resource Management Plan Protest
Critical Item Checklist

The following items *must* be included to constitute a valid protest whether using this optional format, or a narrative letter.
(43 CFR 1610.5-2)

Before including your address, phone number, e-mail address, or other personal identifying information in your **protest**, be advised that your entire **protest**--including your personal identifying information--may be made publicly available at any time. While you can ask us in your **protest** to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so. All submissions from organizations and businesses, and from individuals identifying themselves as representatives or officials of organizations and businesses, will be available for public inspection in their entirety.

Resource Management Plan (RMP) or Amendment (RMPA) being protested:

Name:
Address:
Phone Number: ( )

Your interest in filing this protest (how will you be adversely affected by the approval or amendment of this plan?):

Issue or issues being protested:

Statement of the part or parts of the plan being protested:

Richfield Field Office Planning Area
Proposed Resource Management Plan and Final Environmental Impact Statement

Lead Agency: U.S. Department of the Interior, Bureau of Land Management
Type of Action: Final, Administrative
Jurisdiction: Comprising all of Sanpete, Sevier, Wayne, Piute, and portions of Garfield and Kane Counties, Utah.

Abstract: The Richfield Proposed Resource Management Plan and Final Environmental Impact Statement (PRMP/FEIS) describes and analyzes the Proposed RMP and other alternatives presented in the Draft RMP and EIS (DRMP/DEIS) for the planning and management of public lands and resources administered by the Bureau of Land Management (BLM), Richfield Field Office in Utah. The Proposed RMP is open for a 30-day review and protest period beginning, August 8, 2008, the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability (NOA) of the Final EIS in the Federal Register.

The Proposed RMP was crafted primarily from the Preferred Alternative presented in the DRMP/DEIS (Alternative B) and includes other decisions within the range of alternatives (Alternatives N, A, C, and D) in response to public comments and internal review. The No Action Alternative (Alternative N) reflects current management. The BLM has removed the DRMP/DEIS Alternative B (Preferred Alternative) from the PRMP/FEIS. The other DRMP/DEIS Alternatives (Alternatives N, A, C, and D) and analyses are carried forward in the PRMP/FEIS only for comparative purposes and to correct some mistakes that were identified during the public comment period.

Protest: Protests must be postmarked or received no later than 30 days after publication of the NOA by the EPA in the *Federal Register*. The 30-day protest period (identified above) will not be extended. Refer to the instructions in the dear reader letter for additional information on how to protest. The close of the protest period will be announced in news releases, newsletters, and on the Richfield RMP website at http://www.blm.gov/ut/st/en/fo/richfield/planning.html.

PREFACE

How to Use This Document

This section explains where information is located and provides an overview of the Proposed Resource Management Plan (PRMP) and the associated Final Environmental Impact Statement (FEIS) process. The Proposed RMP/Final EIS is organized into three separate volumes containing the following major chapter headings and information.

Volume I

- **Chapter 1, Introduction, Purpose and Need—**Introduces the purpose and need to which the Bureau of Land Management (BLM) is responding; provides an overview of the BLM planning process and statutes (laws), limitations, and guidelines the BLM must adhere to in preparing an RMP; and presents the scope of issues the RMP must address in detail. It describes the relationship of this RMP with other plans.

- **Chapter 2, Description of Alternatives—**Describes management guidance common to all alternatives, as well as alternatives considered but eliminated from further consideration. It also presents specific management actions proposed under the alternatives and a comparative summary of the impacts of each alternative. The Common to All Alternatives category includes management actions that may be rule, regulation, law, policy, or best management practices (BMP) that the BLM will implement regardless of the alternative selected. The No Action Alternative (Alternative N) reflects current management. Management actions for the No Action Alternative, Proposed RMP, and three alternatives (A, C, and D) are described in Chapter 2. These alternatives present a reasonable range based on new information, guidance, policy, or scientific knowledge. In the DRMP/DEIS, Alternative B was identified as BLM's preferred alternative. In the Final EIS, Alternative B has been modified based on BLM review and public comment to form the Proposed RMP.

- **Chapter 3, Affected Environment—**Describes the Richfield Field Office (RFO) and the existing environmental conditions that would be affected by the alternatives. This chapter is organized similarly to Chapter 2, except socioeconomic conditions are included.

Volume II

- **Chapter 4, Environmental Consequences—**Forms the scientific and analytic basis for the comparison of environmental impacts of the alternatives, including the No Action Alternative, as described in Chapter 2. Under each alternative, analysis is organized by resource (as described for Chapter 2) and socioeconomic conditions.

- **Chapter 5, Consultation and Coordination—**Describes the scoping process and other past and planned agency consultation and public involvement activities. Chapter 5 also includes responses to comments from the cooperating agencies and from public comments that required a change to the Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS).

Volume III

- **Glossary—**Provides an alphabetized list of definitions for terms used in this PRMP/FEIS.

- **Acronyms—**Provides an alphabetized list defining acronyms and abbreviations used in this PRMP/FEIS.
- **References—**Provides details for references cited within the document. Most cited documents are available from other public sources such as libraries; many are available for public review at the RFO.
- **Appendices—**Includes documents and information that support existing resource conditions or situations, substantiate analysis, provide resource management guidance, explain processes, or provide other information directly relevant to the PRMP/FEIS.
- **Maps.**
- **CD of Comments and Responses on the Draft RMP/EIS.**

EXECUTIVE SUMMARY

INTRODUCTION

In accordance with the National Environmental Policy Act of 1969 (NEPA, 42 United States Code [U.S.C.] 4321 et seq.) and under the authority of the Federal Land Policy and Management Act of 1976 (FLPMA, 43 U.S.C. 1701 et seq.), the Bureau of Land Management (BLM) has prepared a Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS) for public lands and resources administered by the Richfield Field Office (RFO) in Utah. The PRMP/FEIS includes an identification and analysis of the Proposed RMP for future management of the public lands and resources that are administered by the BLM's RFO. The planning area is located in south-central Utah and includes all of Sanpete, Sevier, Piute, and Wayne counties and portions of Garfield and Kane counties, an area totaling 5.4 million acres. Of this area, the BLM manages a 2.1 million-acre surface and subsurface (mineral) estate, an additional 1.5 million acres of federal mineral resources underlying the national forests, and 95,000 acres of split-estate lands on which the mineral estate is held by the Federal Government but the surface rights belong to the State or private parties. The planning area is administered primarily by the RFO with additional support from the BLM Hanksville field station. Decisions in this PRMP/FEIS apply only to BLM-administered public lands (surface and subsurface) and resources.

The PRMP/FEIS resulted from public involvement and the gathering of the best available information. The BLM posted a Notice of Intent (NOI) in the *Federal Register* to initiate the scoping phase of the planning process on November 1, 2001. Citizens and groups submitted comments from November 2001 to April 2002, helping the BLM identify the issues that were addressed during this planning process. Based on agency expertise and on issues raised by the public, the BLM prepared a Draft Resource Management Plan/Draft Environmental Impact Statement (DRMP/DEIS) with a full description of the affected environment, a reasonable range of alternatives, and an analysis of the impacts of each alternative. The BLM posted the Notice of Availability (NOA) of the DRMP/DEIS on October 26, 2007. The public submitted comments on the DRMP/DEIS from October 2007 to January 2008. Based on comments on the DRMP/DEIS and internal review, the BLM wrote the PRMP/FEIS and posted a NOA for the PRMP/FEIS on August 8, 2008.

DRAFT ALTERNATIVES

Five alternatives, including a No Action Alternative, were analyzed in detail in the DRMP/DEIS (2007). The alternatives were developed to address major planning issues that were identified through public scoping and to provide management direction for resource programs. The alternatives are as follows:

- **Alternative N (No Action)** would continue to manage the land and resources according to direction prescribed in the six existing Land Use Plans (LUPs), as modified by subsequent law, regulation, and policy. Of the alternatives, Alternative N would least restrict cross-country off-highway vehicle (OHV) use, designate the most miles of open routes, continue the designation of four areas of critical environmental concern (ACEC) (14,780 acres), continue identification of one special recreation management area (SRMA) (120 acres), and manage all 12 eligible wild and scenic river (WSR) segments (135 miles) to protect their outstandingly remarkable values.
- **Alternative A** would manage the land and resources with an emphasis on providing motorized access and encouraging commodity production—mining, grazing, commercial recreation, commercial woodland products harvesting, and energy development, including oil and gas—using the minimum restrictions required to meet legal, regulatory, and policy mandates. To

protect resources, Alternative A relies on existing laws, regulations, and policies, rather than on special management prescriptions or special designations. Of the alternatives, Alternative A would least restrict oil and gas leasing and mining, designate no ACECs, recommend no suitable WSR segments, and identify five SRMAs (514,500 acres).

- **Alternative B (Preferred Alternative)** would manage the land and resources by relying primarily on existing law, regulation, and policy and by applying special designations and restrictive management prescriptions only as needed to protect threatened or otherwise important resources. Alternative B would eliminate overlapping wilderness study areas (WSA)/ACEC designations, designate two ACECs (2,530 acres), recommend two suitable WSR segments (Dirty Devil and Fremont Gorge [59 miles]), identify five SRMAs (838,700 acres), and provide protection to 12 areas that would be managed as non-WSA lands with wilderness characteristics (78,600 acres) to protect, preserve, and maintain their wilderness characteristics.
- **Alternative C** would manage the land and resources by putting more emphasis on protecting special and sensitive natural resources. Alternative C would protect all 12 eligible river segments as suitable WSRs, designate all 16 potential ACECs (886,810 acres), identify four SRMAs (930,000 acres), and prohibit cross-country OHV use.
- **Alternative D** would manage the land and resources by putting the most emphasis on protecting special, important, and sensitive resources and by applying special designations and restrictive prescriptions. Alternative D would recommend all 12 eligible river segments as suitable WSRs, designate all 16 potential ACECs (886,810 acres), identify seven SRMAs (1,358,100 acres), and provide the greatest protection to scenic values and non-WSA lands with wilderness characteristics (682,600 acres) to protect, preserve, and maintain their wilderness characteristics. Alternative D would prohibit cross-country OHV use, designate the fewest miles of routes open to motor vehicles, and impose the greatest restrictions on OHVs, oil and gas leasing, and mining.

The alternatives were described in detail in Chapter 2 and analyzed in Chapter 4 of the DRMP/DEIS. Based on the Chapter 4 analysis, Alternative N was determined to have the greatest overall environmental impact, followed by Alternative A, Alternative B, and Alternative C, respectively. Alternative D would have the least environmental impact and would provide the greatest protection for most elements of the affected environment. Conversely, Alternative A would provide the greatest opportunities and the least restrictions for developing energy and mineral resources; whereas Alternative N would least restrict OHV use.

THE PROPOSED RMP

The Proposed RMP (summarized in Table ES-1) was crafted primarily from the Preferred Alternative presented in the DRMP/DEIS (Alternative B) and includes other decisions within the range of alternatives (Alternatives N, A, C, and D) in response to public comments and internal review. The No Action Alternative (Alternative N) reflects current management. The BLM has removed the DRMP/DEIS Alternative B (Preferred Alternative) from the PRMP/FEIS. The other DRMP/DEIS Alternatives (Alternatives N, A, C, and D) and analyses are carried forward in the PRMP/FEIS only for comparative purposes and to correct some mistakes that were identified during the public comment period.

Table ES-1 Proposed RMP Summary

Resource/ Resource Use	Proposed RMP
Air Quality	Manage all BLM and BLM-authorized actions to maintain air quality as prescribed by federal, tribal, state, and local laws and regulations. This management includes meeting the National Ambient Air Quality Standards (NAAQS) and ensuring that BLM-authorized actions continue to keep the area in attainment, meet Prevention of Significant Deterioration (PSD) Class II standards, and protect Class I airsheds. Mitigate, through best-available control technology, potential adverse impacts of site-specific actions, as identified in NEPA documents prepared at the time an action is proposed and as part of the state permitting process and PSD review.
Soil Resources	Maintain or improve soil resources through implementation of *Standards for Rangeland Health* and other appropriate protection measures.
Water Resources	Maintain or improve water quality and quantity through implementation of *Standards for Rangeland Health* and other appropriate protection measures.
Vegetation	Maintain or improve soil, water, and vegetation resources through implementation of *Standards for Rangeland Health* and other appropriate protection measures.
Cultural Resources	Reduce imminent threats to significant cultural resources from natural and human-caused deterioration or potential conflicts with other resources.
	Allocate and manage cultural resource sites for scientific use, public use, conservation use, traditional use, and experimental use categories.
Paleontological Resources	Require paleontological inventories in Class I and Class II areas.
Visual Resources	Manage areas according to the following Visual Resource Management Classes: • Class I: 446,900 acres • Class II: 249,800 acres • Class III: 393,100 acres • Class IV: 1,038,200 acres
Special Status Species	Conserve and recover all special status species (SSS) and their habitats. Employ strategies to avoid or reduce the fragmenting of habitat. Manage oil and gas leasing as open subject to major constraints (NSO) within ½ mile of greater sage-grouse leks. Allow no surface disturbing or otherwise disruptive activities in greater sage-grouse winter habitat from December 15 through March 14. Allow no surface disturbing or otherwise disruptive activities within 2 miles of a greater sage-grouse lek from March 15 to July 15 to protect sage-grouse breeding and brood-rearing habitat.

Table ES-1 Proposed RMP Summary

Resource/ Resource Use	Proposed RMP
Fish and Wildlife	Maintain, restore, protect, and enhance habitats to support a diversity of fish and wildlife species.
Wild Horses and Burros	Manage wild horses and burros at appropriate management levels (AML) to ensure a natural ecological balance between horse and burro populations and wildlife, livestock, vegetation resources, and other resource values (Map 3-8).
	Manage Canyonlands Herd Management Area (HMA) with an AML of 60–100; allocate 600 Animal Unit Months (AUM) for wild burros.
Fire and Fuels Management	Manage fire and fuels to protect life, firefighter safety, property, and other critical resources and, where appropriate, to restore natural systems.
	Manage fire and fuels through treatments, averaging 73,600 acres annually, for a maximum level of 1,472,000 acres over the life of the PRMP/FEIS. Use the full range of treatment types, including prescribed fire; mechanical, chemical, biological, and cultural treatments; and wildland fire use.
Non-Wilderness Study Area Lands with Wilderness Characteristics	Manage the following 12 non-WSA lands with wilderness characteristic areas (78,600 acres) specifically to protect, preserve, and maintain their wilderness characteristics: (1) Dirty Devil/French Spring (6,100 acres) (2) Dogwater Creek (3,100 acres) (3) Horseshoe Canyon South (12,200 acres) (4) Jones Bench (2,600 acres) (5) Labyrinth Canyon (2,800 acres) (6) Little Rockies (9,500 acres) (7) Mount Ellen—Blue Hills (3,900 acres) (8) Mount Pennell (4,700 acres) (9) Notom Bench (8,200 acres) (10)Ragged Mountain (7,900 acres) (11)Red Desert (8,900 acres) (12)Wild Horse Mesa (8,700 acres) Protect, preserve and maintain the wilderness characteristics in the 12 areas (78,600 acres) of non-WSA lands with wilderness characteristics through the following land allocations and prescriptions: • Designate as Visual Resource Management (VRM) Class II • Limit motorized use to designated routes

Table ES-1 Proposed RMP Summary

Resource/ Resource Use	Proposed RMP
	• Retain lands in public ownership • Designate as an Avoidance Area for rights-of-way (ROW) • Designate leasing category as open to leasing subject to major constraints (no surface occupancy [NSO]) • Close to mineral material sales • Designate as unavailable for further consideration for coal leasing • Continue maintenance and use of existing facilities Prohibit private or commercial woodland harvest or seed collection Healthy Lands Initiative projects could be considered if they improve the overall goals and objectives for managing the wilderness characteristics of these areas
Forestry and Woodland Products	Provide forest and woodland products on a sustainable basis consistent with other land management objectives.
Livestock Grazing	Designate forage allocations as depicted on Map 2-6 and in Appendix 7 (Table A7-2).
Recreation	Establish five SRMAs (860,390 acres) to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Establishing the Factory Butte SRMA would limit the impacts on vegetation from cross-country OHV use to an 8,500 acre area. Constructing facilities in the Big Rocks SRMA would have localized adverse impacts from removal of vegetation in those areas; long-term impacts would be beneficial by concentrating use areas and thus limiting the extent of vegetation disturbance. Managing the Dirty Devil/Robbers Roost SRMA (290,500 acres) for primitive and semi-primitive recreation would reduce the potential for surface disturbance and localized removal of vegetation because of recreation. Closing canyons within the Dirty Devil/Robbers Roost SRMA to OHV recreation use and limiting OHV recreation use to designated routes would reduce potential impacts to vegetation. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities would have localized adverse impacts from removal of vegetation in those areas; long-term impacts would be beneficial by concentrating use areas and thus limiting the extent of vegetation disturbance. Managing the Henry Mountains SRMA for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for soil disturbance.
Travel Management	Manage areas according to the following travel management designations: • Open: 9,890 acres • Limited: 1,908,210 acres • Closed: 209,900 acres

Table ES-1 Proposed RMP Summary

Resource/ Resource Use	Proposed RMP
	• Designated routes: 3,739 miles* *Implementation-level decision* • Designated routes with seasonal closures or size/width restrictions: 538 miles • Closed routes: 345 miles
Lands and Realty	Retain public lands in federal ownership, unless disposing of a particular parcel would serve the national interest. Consider land tenure adjustments (e.g., exchanges and acquisitions) that meet identified criteria.
	Identify 92 parcels, totaling 13,400 acres, for sale under Section 203 of the FLPMA.
	Review existing withdrawals to determine whether those lands are serving the purposes for which they were withdrawn.
	Continue existing withdrawals (154,700 acres); recommend 21,500 acres for withdrawal from mineral entry. Total acres: 176,200
	Identify 153,600 acres as avoidance areas and 446,700 acres as exclusion areas for ROWs.
Leasable Minerals	Identify lands available for oil and gas leasing and development subject to the following lease categories: • Open to leasing subject to the standard terms and conditions: 608,700 acres • Open to leasing subject to moderate constraints (timing limitation, Controlled Surface Use [CSU]): 917,500 acres • Open to leasing subject to major constraints (NSO): 154,500 acres • Closed to leasing: 447,300 acres
Locatable Minerals	Continue existing withdrawals (154,700 acres); recommend 21,500 acres for withdrawal. Total acres: 176,200
Salable Minerals (Mineral Materials)	Identify lands available for development of mineral materials subject to the following lease categories: • 447,300 acres closed to mineral material disposal • 608,700 acres open subject to standard stipulations • 1,072,000 acres open with restrictions
Wilderness Study	Manage 11 existing WSAs (Map 3-14) in a manner that does not impair their suitability for designation as wilderness in accordance with BLM Handbook H-8550-1, *Interim Management Policy for Lands Under Wilderness Review* (IMP).

* *This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.*

Table ES-1 Proposed RMP Summary

Resource/ Resource Use	Proposed RMP
Areas	Designate as VRM Class I.
	Designate as limited or closed to OHV use: • Limited: 271,600 acres • Closed: 175,300 acres
Wild and Scenic Rivers	Manage suitable river segments in a manner that would protect their outstandingly remarkable values, tentative classification, and free-flowing nature. River corridors of eligible rivers that are determined not suitable would be managed according to other resource decisions for the Proposed RMP. Suitable: Capitol Gorge (the Fremont River immediately above Capitol Reef National Park), 1 segment, 5 miles
Areas of Critical Environmental Concern	Provide special management attention to relevant and important values, resources, natural systems, and hazards in designated ACECs. Potential ACECs that are not designated would be managed according to other resource decisions for the Proposed RMP.
	Designate two ACECs totaling 2,530 acres: the North Caineville Mesa ACEC and the Old Woman Front ACEC.

Major Changes from the Draft RMP to the Proposed RMP

Review of and comments on the DRMP/DEIS have resulted in several changes and the subsequent development of the PRMP/FEIS. Changes are in response to a combination of public comments, meetings with cooperating agencies, internal review, and changes in BLM policy and management direction. Some specific comments suggested that alternatives to maximize particular uses or to maximize protection of certain resources should be analyzed in detail. Although these types of alternatives were considered, they were not analyzed in detail because they did not meet BLM's multiple use and sustained yield mandate as established in the FLPMA or the planning criteria set out in the DRMP/DEIS. Other comments suggested consideration of items outside the scope of BLM's decision authority and therefore were not considered in this PRMP/FEIS. Changes from the DRMP/DEIS include the following:

- The DRMP/DEIS Preferred Alternative (Alternative B) has been modified and renamed the Proposed RMP.
- Maps were updated to reflect changes in the Proposed RMP and to correct errors.
- Air Quality: Air quality emissions calculations were completed for each alternative.
- Livestock Grazing: Temporary non-renewable use of grazing was added to reduce site-specific fuels (i.e., cheat grass).
- Non-WSA lands with wilderness characteristics: Management prescriptions for non-WSA lands with wilderness characteristics were added to the Proposed RMP. Twelve land units (totaling 78,600 acres) would be managed to protect, preserve, and maintain their wilderness characteristics.
- Recreation:
  - Under the PRMP/FEIS, the size of the Factory Butte SRMA was increased, and the size of the Big Rocks SRMA was decreased.
- Travel Management:
  - The boundary of the Factory Butte Play Area was adjusted to designate OHV play areas while avoiding sensitive plant species.
  - The sizes of the Big Rocks Trails Area and the Glenwood Play Area were decreased.
  - The Mayfield Open Area was eliminated from the PRMP/FEIS.
- Wild and Scenic Rivers: The Fremont River in the Fremont River Gorge would be found suitable as a wild river for inclusion in the National Wild and Scenic River System (NWSRS), whereas the Dirty Devil River would be found non-suitable for inclusion in the NWSRS.

ENVIRONMENTAL CONSEQUENCES

The environmental consequences that could result from the Proposed RMP were analyzed relative to meaningful direct, indirect, short-term, and long-term impacts. The impacts of each alternative are summarized in Chapter 2 and described in Chapter 4. Also included in Chapter 4 is a discussion of cumulative impacts that could result from the Proposed RMP when added to other past, present, and reasonably foreseeable actions. The Proposed RMP would be considered by the BLM to be the environmentally preferable alternative when taking into consideration the human (social and economic) environment as well as the natural environment. The Proposed RMP attempts to balance protection and conservation of physical, biological, and cultural resources, while providing for commodity production and mineral extraction.

CONSULTATION

During the planning process, BLM coordinated with the State Historic Preservation Officer (SHPO), United States Fish Wildlife Service (USFWS), Native American tribes, cooperating agencies, and the public.

- **Consultation with State of Utah SHPO:** Section 106 of the National Historic Preservation Act (NHPA) mandates a review process for all federally funded projects that will impact sites listed on, or eligible to be listed on, the National Register of Historic Places (NRHP).
- **Consultation with USFWS:** The Endangered Species Act (ESA) directs all federal agencies to work to conserve endangered and threatened species and to use their authorities to further the purposes of the ESA. Section 7 of the ESA, called "Interagency Cooperation," is the mechanism by which federal agencies ensure that the actions they take, including those they fund or authorize, do not jeopardize the existence of any listed species.
- **Coordination with Native American Tribes:** BLM is required by law to coordinate with Native American tribes in developing RMPs, to be consistent with tribal plans and protection of treaty rights, and to observe specific planning coordination authorities. In developing the Richfield RMP, BLM representatives met with representatives of the Hopi, Navajo, Paiute, and Ute Tribes.
- **Coordination with Cooperating Agencies:** In preparing the Richfield DRMP/DEIS and PRMP/FEIS, BLM invited other federal agencies and state and local governments to participate as cooperating agencies. The State of Utah and Garfield, Piute, Sevier, and Wayne counties each signed cooperating agency agreements and participated as members of the interdisciplinary team. Other federal agencies, including the United States Forest Service (USFS), National Park Service (NPS), and USFWS, also participated in the interdisciplinary team meetings.
- **Other Consultation:** The field manager, land use planner, and other staff communicated regularly with a variety of groups and individuals that were interested in the RMP. Such communication will continue through the Record of Decision (ROD) and plan implementation.

FUTURE ACTIONS, PROTEST PERIOD, RECORD OF DECISION, AND IMPLEMENTATION

The BLM posted the NOA in the *Federal Register* on August 8, 2008. The NOA formally begins the 30-day protest period, scheduled to end September 8, 2008. The BLM Planning Regulations set forth the provisions applicable to protests (43 *Code of Federal Regulations* [CFR] 1610.5-2). A person who meets the conditions as described in the regulations cited above and who wishes to file a protest must file said protest within 30 days of the date that the NOA is published in the *Federal Register.* Additional information on protests is set forth in the "Dear Reader" letter of the Richfield PRMP/FEIS. The Record of Decision (ROD) will be the decision document for the approved plan. The ROD will state the decision on the RMP, will state the reasons for the decision, will identify all alternatives, and will state compliance with applicable laws. The Approved RMP will provide overarching guidance for all subsequent site-specific decisions and implementation and activity plans within the RFO. Many LUP decisions are implemented or become effective upon publication of the ROD for the Approved RMP and may include desired conditions, land use allocations (allowable uses), or designations and special designations. These designations include the following:

- VRM class designations
- OHV area designations
- Areas closed and open to oil and gas leasing and the stipulations applied to leases within the open areas

- WSR suitability recommendations
- ACEC designations
- ROW avoidance/exclusion

CHAPTER 1—INTRODUCTION, PURPOSE AND NEED

1.1 INTRODUCTION

In accordance with the Federal Land Policy and Management Act of 1976 (FLPMA), the Bureau of Land Management (BLM) is responsible for management of public lands and its resources, based on the principles of multiple use and sustained yield. Land Use Plans (LUP) provide management direction, determine appropriate multiple uses, allocate resources, develop strategies to manage and protect resources, and establish systems to monitor and evaluate the status of resources and effectiveness of management. LUPs are intended to guide management, allowing continuing uses of public land over extended time periods.

The Richfield Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS) identifies the Proposed RMP, which has been selected out of the range of alternatives in the Draft Resource Management Plan/Draft Environmental Impact Statement (DRMP/DEIS) for the future management of public land and resources in the Richfield Field Office (RFO). The Proposed RMP was crafted primarily from the Preferred Alternative presented in the DRMP/DEIS (Alternative B) and includes other decisions within the range of alternatives (Alternatives N, A, C, and D) in response to public comments and internal review. The PRMP/FEIS includes a new analysis (presented in Chapter 4) to describe the environmental impacts of implementing the Proposed RMP. The BLM has removed the DRMP/DEIS Alternative B (the Preferred Alternative) from the PRMP/FEIS. The other four alternatives analyzed in the DRMP/DEIS are carried forward for comparative purposes and to correct minor errors that were pointed out by the public and during internal review.

This PRMP/FEIS addresses the future management of 2.1 million surface and mineral estate acres of public land and an additional 95,000 acres of federal mineral estate (underlying private or state surface) in Sanpete, Sevier, Piute, and Wayne counties, as well as portions of Garfield County. There are also 21,500 acres of Kane County within the planning area. However, these acres lie entirely within Glen Canyon National Recreation Area [NRA], which is managed by the National Park Service [NPS], so no decisions within this PRMP/FEIS will affect those lands. This PRMP/FEIS was prepared in cooperation with the five affected county governments, the State of Utah, several Native American tribes, and other federal agencies.

1.2 PURPOSE AND NEED

Council on Environmental Quality (CEQ) regulations (40 *Code of Federal Regulations* [CFR] 1502.13) require the purpose and need of an environmental impact statement (EIS) to "briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives." The purpose and need section of this PRMP/FEIS provides a context and framework for establishing and evaluating the reasonable range of alternatives that are described in Chapter 2.

1.2.1 Purpose

Section 102 of FLPMA sets forth the policy for periodically projecting the present and future use of public lands and their resources, using the land use planning process. Sections 201 and 202 of FLPMA establish the BLM's land use planning requirements. The BLM *Land Use Planning Handbook* (H-1601-1) provides guidance for implementing the BLM land use planning requirements that are established by Sections 201 and 202 of FLPMA and by the regulations in 43 CFR 1600.

The purpose, or goal, of the LUP is to provide a comprehensive framework for the BLM's management of the public lands within the planning area and to ensure that these public lands are managed in accordance with FLPMA and with the principles of multiple use and sustained yield. The purpose of this plan revision is to consolidate the existing LUPs and their amendments; to reevaluate, with public involvement, existing conditions, resources, and uses; and to reconsider the mix of resource allocations and management decisions that are designed to balance uses with the protection of resources, pursuant to FLPMA and other applicable law. This RMP revision will address the growing needs of the planning area and result in selection of a management strategy that best achieves a combination of the following:

- Employ a community-based planning approach to collaborate with federal, state, and local cooperating agencies.
- Resolve multiple-use conflicts or issues between resource values and resource uses. The resulting Proposed RMP will establish consolidated guidance and updated goals, objectives, and management actions for the public lands in the RFO. The Proposed RMP will be comprehensive in nature and will address issues that have been identified through agency, interagency, and public scoping efforts.
- Establish goals and objectives (desired outcomes) for management of resources and resource uses within the approximately 2.1 million surface and mineral estate acres and the additional 95,000 acres of federal mineral estate (underlying private or state surface) that are administered by the BLM's RFO, in accordance with the principles of multiple use and sustained yield.
- Identify LUP decisions to guide future land management actions and subsequent site-specific implementation decisions.
- Identify management actions and allowable uses that are anticipated to achieve the established goals and objectives and to reach desired outcomes.
- Provide comprehensive management direction by making land use decisions for all appropriate resources and resource uses that are administered by the RFO.
- Provide for compliance with applicable tribal, federal, and state laws, standards, implementation plans, and BLM policies and regulations.
- Recognize the nation's needs for domestic sources of minerals, food, timber, and fiber, and incorporate requirements of the Energy Policy and Conservation Act (EPCA) Reauthorization of 2000.
- Retain flexibility to adapt to new and emerging issues and opportunities and to provide for adjustments to decisions over time, based on new information and monitoring.
- Strive to be compatible with existing plans and policies of adjacent local, state, tribal, and federal agencies and to be consistent with federal law, regulations, and BLM policy.

1.2.2 Need

The following six LUPs and subsequent amendments currently guide management of the public lands within the planning area. In addition, the following Mineral Leasing Activity Plans, Recreation Management Plans, Habitat Management Plans (HMP), and existing environmental assessments (EA) and EISs currently apply federal policy to resources at a more manageable level than the current situation.

1.2.2.1 Six LUPs and Subsequent Amendments

- *Forest Management Framework Plan (MFP),* approved in 1977
- *Mountain Valley MFP,* approved in 1982
- *Henry Mountain MFP*, approved in 1982
- *Parker Mountain MFP*, approved in 1982
- *Cedar-Beaver-Garfield-Antimony RMP*, approved in 1986
- *San Rafael RMP,* approved in 1991

1.2.2.2 Mineral Leasing Activity Plans

- *Oil and Gas Leasing EA*, 1988
- *Designation of Hydrocarbon Lease Categories*, 1984

1.2.2.3 Recreation Management Plans

- *Henry Mountains Off-Road Vehicle Implementation Plan*
- *Parker Mountain Off-Road Vehicle Implementation Plan*
- *Mountain Valley Off-Road Vehicle Implementation Plan*
- *Forest Planning Unit OHV Implementation Plan*, 1983
- *Cedar-Beaver-Garfield-Antimony OHV Implementation Plan*

1.2.2.4 Habitat Management Plans

- *Parker Mountain HMP*
- *Henry Mountains Desert Bighorn Sheep HMP*
- *Antimony HMP*

1.2.2.5 Existing Environmental Assessments and Impact Statements

- *Utah BLM Statewide Wilderness EIS*, 1990
- *Utah Combined Hydrocarbon Leasing Regional EIS*, 1984
- *Henry Mountains Grazing EIS*, 1983
- *Parker Mountain Grazing EIS*, 1979
- *Mountain Valley Grazing EIS*, 1980
- *United States Forest Service (USFS)/BLM Motorized Events EA*, 2001 (J-050-01-024)

Through a formal evaluation completed in February 2001, the BLM identified the need, or requirement, to revise these six LUPs. Since completion of these LUPs, considerable changes have occurred within the planning area. Heightened public awareness, increased public demand for use of the lands, and increases in conflict between competing resource values and land uses continue to challenge the BLM's management goals and objectives. The RFO is facing a variety of issues that affect local communities, regional and state interests, and the health of the public lands. These emerging issues and changing circumstances resulted in the need to revise the existing plans. Given the nature of the issues that face the RFO and the overlap between federal, tribal, state, and local jurisdictions, the RFO will combine the six existing LUPs into one planning document—the Richfield Proposed RMP.

A number of new issues (such as new federal species listings), higher levels of controversy concerning existing issues, and new (unforeseen) public land uses and concerns have arisen over the years. These issues were not included or were not adequately addressed in the existing plans. These and other selected examples of new data, new and revised policies, and emerging issues and changing circumstances demonstrate the need to revise the existing plans.

1.3 DESCRIPTION OF THE PLANNING AREA

The planning area, located in south-central Utah, includes all of Piute, Sanpete, Sevier, and Wayne counties and portions of Garfield and Kane counties, an area totaling 5.4 million acres (Map 1-1). The BLM administers 2.1 million acres of public land surface and mineral estate, and an additional 95,000 acres of federal minerals estate for which the surface estate is in non-federal (state or private) ownership.

The BLM also has administrative responsibility for 2,082,865 acres of mineral estate for which the surface is managed by other federal agencies (USFS and NPS). On these lands, leasing of federal minerals is subject to management as directed by the surface managing agency, and the decisions of this Proposed RMP will pertain only to the BLM's role in administering the minerals. Proposed RMP decisions apply only to BLM-administered public lands and resources. Table 1-1 summarizes the surface land ownership within the planning area. In this document, the term "planning area" applies to all lands within the five-county area, regardless of surface ownership. It is important to note that the BLM can make decisions that affect only public lands and resources, but it is responsible for collaborative planning with the public and adjacent jurisdictions to consider the impacts of its actions on all resources in the region.

Table 1-1. Land Ownership—Richfield Planning Area

Ownership	Acres	Percentage of Planning Area
Public lands (BLM-administered)	2,128,200	39
National forests	1,476,400	27
National parks and recreation areas	608,500	11
Private	803,600	15
Utah School and Institutional Trust Lands Administration (SITLA)	385,300	7
Other state, county, city, wildlife, park, and outdoor recreation areas	36,700	1
Tribal lands	1,200	<1
Total	**5,439,900**	**100**

1.4 PLANNING PROCESS

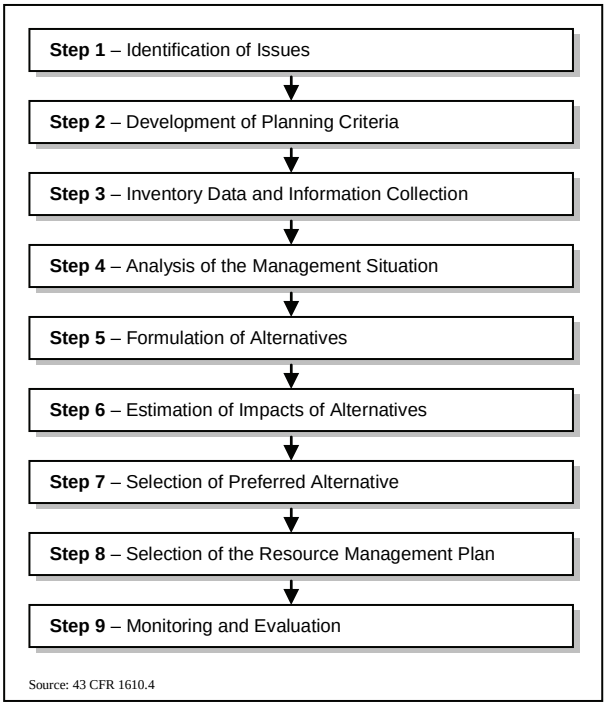
FLPMA requires BLM to use LUPs as tools by which "present and future use is projected" (43 United States Code [U.S.C.] 1701 [a][2]). FLPMA's implementing regulations for planning, 43 CFR 1600, state that LUPs are a preliminary step in the overall process of managing public lands, "designed to guide and control future management actions and the development of subsequent, more detailed and limited scope plans for resources and uses" (43 CFR 1601.0-2). Public participation and input are important components of land use planning.

Revision of existing LUPs is a major federal action for the BLM. The National Environmental Policy Act (NEPA) of 1969, as amended, requires federal agencies to prepare an EIS for major federal actions (United States Department of the Interior [USDI] Departmental Manual, Part 516, Chapter 11.4A[1]); thus, the FEIS accompanies the revision of the existing plans. This PRMP/FEIS analyzes the impacts of five alternative scenarios, including the No Action Alternative, for management of the public lands and resources within the planning area. The No Action Alternative reflects current management (the existing plans). NEPA requires analysis of a No Action Alternative.

The BLM uses a nine-step planning process (Figure 1-1**Error! Reference source not found.**) when developing and revising RMPs, as required by 43 CFR 1600 and by planning program guidance in the

BLM Land Use Planning Handbook (H-1601-1). The planning process is designed to help the BLM identify the uses that the public desires for BLM-administered lands and to consider these uses to the extent that they are consistent with the laws established by Congress and the policies of the executive branch of the Federal Government.

Figure 1-1. Nine-Step Planning Process



The planning process is issue-driven (Step 1). The plan revision process is undertaken to resolve management issues and problems as well as to take advantage of management opportunities. The BLM used the public scoping process to identify planning issues to direct (i.e., drive) the revision of the existing plans. The scoping process was also used to introduce the public to preliminary planning criteria, which set limits to the scope of the RMP revision (Step 2).

As appropriate, the BLM used existing data from a variety of sources and collected new data as necessary to address planning issues and to fill data gaps that were identified during public scoping (Step 3). Using these data, the planning issues, and the planning criteria, the BLM conducted an Analysis of the Management Situation (AMS) (Step 4) to describe current management and to identify management opportunities for addressing the planning issues. Current management reflects management under the existing plans and management that would continue through selection of the No Action Alternative. The existing affected environment section from the AMS is summarized in Chapter 3 of the PRMP/FEIS. The AMS is included as part of the Administrative Record for this plan and is available in the RFO and on the RFO's planning website (www.blm.gov/ut/st/en/fo/richfield/planning.html).

Results of the first four steps of the planning process clarified the purpose and need and identified key planning issues that need to be addressed in the new RMP. Key planning issues reflect the focus of the RMP revision and are described in more detail in the Planning Issues section of this chapter.

Alternatives constitute a range of management actions that are anticipated to achieve identified goals or objectives. During alternative formulation (Step 5), the BLM collaborated with cooperating agencies to identify goals and objectives (desired outcomes) for resources and resource uses in the planning area. These desired outcomes addressed the key planning issues, were constrained by the planning criteria, and incorporated the management opportunities identified by the BLM. Details of the alternatives were developed through the identification of management actions and allowable uses that are anticipated to achieve the goals and objectives. The alternatives represent a reasonable range for managing resources and resource uses within the planning area, under the multiple use and sustained yield mandate of FLPMA. Chapter 2 of this document describes and summarizes the alternatives.

This PRMP/FEIS also includes an analysis of the impacts of each alternative in Chapter 4 (Step 6). With input from cooperating agencies and BLM specialists and in consideration of planning issues, planning criteria, and the impacts of the alternatives, BLM has identified a Proposed RMP from among the five alternatives (Step 7). This Proposed RMP is documented in the PRMP/FEIS, which will be distributed to the public for review and comment (also Step 7).

Step 8 of the land use planning process will occur following receipt and consideration of public comments on the PRMP/FEIS. In preparing the PRMP/FEIS, the BLM considered all comments received during the public comment period. In developing the PRMP/FEIS, the Utah BLM State Director, who is the decision maker for this plan revision, has the authority and discretion to select an alternative in its entirety or to combine components of the various presented alternatives to prioritize differing resources or uses, consistent with the multiple use and sustained yield mandate. The regulations at 43 CFR 1610 provide, prior to the approval of the Proposed RMP, a 60-day period for the Governor of Utah for "consistency review" and a 30-day period to protest the Proposed RMP to the BLM Director for "any person who participated in the planning process and has an interest which is or may be adversely affected by the approval" of the PRMP/FEIS.

Step 9 is the monitoring and evaluation process. Monitoring is the repeated measurement of activities and conditions over time. Evaluation is a process in which the plan and monitoring data are reviewed to see if management goals and objectives are being met and if management direction is sound. Monitoring data gathered over time is examined and used to draw conclusions on whether management actions are meeting stated objectives, and if not, why. Conclusions are then used to make recommendations on whether to continue current management or what changes need to be made in management practices to meet objectives.

The two types of monitoring that are tied to the planning process include implementation and effectiveness monitoring. Land use plan monitoring is the process of (1) tracking the implementation of land use planning decisions and (2) collecting and assessing data/information necessary to evaluate the effectiveness of land use planning decisions. The two types of monitoring are described below.

Implementation Monitoring: Implementation monitoring is the most basic type of monitoring and simply determines whether planned activities have been implemented in the manner prescribed by the plan. Some agencies call this compliance monitoring. This monitoring documents BLM's progress toward full implementation of the land use plan decision. There are no specific thresholds or indicators required for this type of monitoring.

Effectiveness Monitoring: Effectiveness monitoring is aimed at determining if the implementation of activities has achieved the desired goals and objectives. Effectiveness monitoring asks the question: Was the specified activity successful in achieving the objective? This requires knowledge of the objectives established in the RMP as well as indicators that can be measured. Indicators are established by technical

specialists in order to address specific questions, and thus avoid collection of unnecessary data. Success is measured against the benchmark of achieving desired conditions established by the plan.

Regulations at 43 CFR 1610.4-9 require that the Proposed RMP establish intervals and standards, as appropriate, for monitoring and evaluation of the plan, based on the sensitivity of the resource decisions involved. Progress in meeting the plan objectives and adherence to the management framework established by the plan is reviewed periodically. CEQ regulations implementing NEPA state that agencies may provide for monitoring to assure that their decisions are carried out and should do so in important cases (40 CFR 1505.2(c)). To meet these requirements, the BLM will review the plan on a regular schedule in order to provide consistent tracking of accomplishments and provide information that can be used to develop annual budget requests to continue implementation.

Land use plan evaluations will be used by BLM to determine if the decisions in the RMP, supported by the accompanying NEPA analysis, are still valid. Evaluation of the RMP will generally be conducted every five years per BLM policy, unless unexpected actions, new information, or significant changes in other plans, legislation, or litigation triggers an evaluation. Land use plan evaluations determine if decisions are being implemented, whether mitigation measures are satisfactory, whether there are significant changes in the related plans of other entities, whether there is new data of significance to the plan, and if decisions should be changed through amendment or revision. Evaluations will follow the protocols established by the BLM Land Use Planning Handbook H-1601-1 in effect at the time the evaluation is initiated. Specific monitoring and evaluation needs are identified by resource/uses throughout Chapter 2.

1.5 DECISION FRAMEWORK

As stated in the previous section, identifying the planning issues and developing planning criteria are the first steps in defining the scope of the RMP revision. The planning issues and criteria provide the framework in which planning decisions are made. Planning decisions refer to what is established or determined by the Approved RMP. The Approved RMP provides guidance for planning decisions according to the following categories:

- Physical, biological, and cultural resources
- Resource uses
- Special designations

In the context of these categories, management strategies were developed to provide viable options for addressing planning issues. The management strategies provide the building blocks from which general management scenarios and more-detailed resource management alternatives were developed. The resource management alternatives reflect a reasonable range of management options that fall within limits set by the planning criteria. The planning issues and planning criteria used to revise the existing plans are described in the following sections.

1.5.1 Planning Issues

The BLM conducted an early and open scoping process to determine the scope, or range, of issues to be addressed in this PRMP/FEIS. Scoping identifies the affected public and agency concerns, defines the relevant issues and alternatives that will be examined in detail in the RMP/EIS, and eliminates those that are not significant. The BLM *Land Use Planning Handbook* (H-1601-1), defines planning issues as "…disputes or controversies about existing and potential land and resource allocations, levels of resource use, production, and related management practices."

Public scoping was designed to meet the public involvement requirements of FLPMA and NEPA. This cooperative process included soliciting input from interested state and local governments, tribal governments, other federal agencies and organizations, and individuals, to identify the scope of issues to be addressed in the plan and to assist in the formulation of reasonable alternatives. The scoping process was an excellent method for opening dialogue between the BLM and the general public about management of the public lands and for identifying the concerns of those who have an interest in the area.

As part of the scoping process, the BLM also requested that the public submit nominations for potential areas of critical environmental concern (ACEC) and nominations of rivers for potential inclusion in the National Wild and Scenic Rivers System (NWSRS).

The scoping period for the Richfield RMP began on November 1, 2001, with publication of the Notice of Intent (NOI) in the *Federal Register*, and ended on April 1, 2002. Scoping included open-house meetings in five Utah communities (Richfield, Junction, Manti, Loa, and Salt Lake City). In addition, news releases were used to notify the public regarding the scoping period and the planning process and to invite the public to provide written comments. The RFO received written comments via e-mail, fax, and postal mail. Comments obtained from the public during the scoping period were used to define the relevant issues that would be addressed by a reasonable range of alternatives.

For the Richfield planning process, scoping comments received were placed in one of three categories:

- Issues to be resolved in the PRMP/FEIS
- Issues to be addressed through other policy or administrative action (and therefore not addressed in the PRMP/FEIS)
- Issues to be eliminated from detailed analysis because they are beyond the scope of the PRMP/FEIS

During the scoping process, the public and various agencies identified some important issues to be addressed in the RMP. The *Richfield RMP/EIS Scoping Report* (available for review on the RMP planning webpage at www.blm.gov/ut/st/en/fo/richfield/planning.html) summarizes the scoping process. The issues that were identified in the Scoping Report fall into 1 of 12 broad categories. Other resource and use issues are identified in the BLM *Land Use Planning Handbook* H-1601-1. All these issues were considered in developing the alternatives brought forward in this PRMP/FEIS.

1.5.1.1 Issues to Be Addressed in the Richfield RMP

Those planning issues that were determined to be within the scope of the EIS were used to develop one or more of the alternatives or are addressed in other parts of the EIS. For example, as planning issues were refined, the BLM collaborated with cooperating agencies to develop a reasonable range of alternatives designed to address or resolve key planning issues, such as which areas, if any, contain unique or sensitive resources that require special management. A reasonable range of alternatives provides various scenarios for how the BLM and cooperating agencies can address this and other key planning issues, including the management of resources and resource uses in the planning area. In other words, key planning issues serve as the rationale for alternative development. The key planning issues identified for developing alternatives in this FEIS are as follows:

Issue 1: Where and to what extent can transportation and access be managed to satisfy public demand while protecting natural and cultural resource values?

Use (for recreation, commercial uses, and general enjoyment) of the public lands in southern Utah has grown in popularity in recent years. With this popularity has come a demand for greater variety and

availability of access opportunities, including off-highway vehicle (OHV) use. With the number of visitors growing, resource and user conflicts are becoming more common. OHV use needs to be managed, including identifying areas to be restricted or closed for the protection of other resource values.

***Issue 2:* Which areas should be designated for special management (e.g., ACECs and Wild and Scenic Rivers [WSR]), and how should these areas be managed?**

FLPMA and BLM policy require the BLM to give priority to designation and protection of ACECs during the land use planning process. The Wild and Scenic River Act directs federal agencies to consider the potential for including watercourses into the NWSRS during the land use planning process. The alternatives analyzed in this PRMP/FEIS include a range of management prescriptions for managing potential ACECs, as well as for managing the eligible rivers as suitable WSRs.

***Issue 3:* How should non-wilderness study area (WSA) lands with wilderness characteristics be managed?**

The RFO includes lands that are outside designated WSAs but that contain the wilderness characteristics of naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive or unconfined recreation. The PRMP/FEIS analyzes alternative decisions and levels of protection for non-WSA lands with wilderness characteristics to protect, preserve, and maintain their wilderness characteristics.

***Issue 4:* How should recreation activities be managed to satisfy public demand while protecting natural and cultural resource values?**

Recreation in southern Utah has grown in popularity in recent years. With this popularity has come a demand for a greater variety and availability of recreation opportunities such as motorized and non-motorized trails (including equestrian trails), climbing, mountain biking, hiking, and camping. With the number of visitors growing, resource and user conflicts are becoming more common. Recreational use needs to be managed, including identifying special recreation management areas (SRMA) in which management attention is needed to highlight important recreational opportunities or to deal with problems such as conflicts between users or impacts on other resources.

***Issue 5:* Which areas will be available for mineral development, and which restrictions should be imposed?**

Mineral development is considered a major issue for the planning area, not only for economic reasons but also for the degree to which it can potentially affect other resources (including soils, vegetation, water quality, wildlife habitat and naturalness, solitude, and opportunities for primitive or unconfined recreation). Throughout this PRMP/FEIS, energy and mineral development are analyzed in the context of the need for protection of other resources. BLM has management discretion in four areas, and the alternatives include a range of options for each:

- Areas closed or open to oil and gas leasing and the stipulations on leasing within the open areas
- Areas closed or open to disposal of salable minerals (mineral materials)
- Areas proposed for withdrawal from entry under the mining laws
- Areas available for further consideration for coal leasing (coal unsuitability)

***Issue 6:* Which areas will be available for livestock grazing, in light of resource conflicts?**

The Secretary of the Interior, through the BLM, manages approximately 264 million acres of public rangelands throughout the western United States. The Taylor Grazing Act of 1934, FLPMA, and the Public Rangelands Improvement Act of 1978 together guide the BLM's management of livestock grazing on public lands. The objectives for grazing administration regulations are to "promote healthy sustainable rangeland ecosystems; accelerate restoration and improvement of public rangelands to properly functioning condition; efficiently and effectively administer domestic livestock grazing; and provide for the sustainability of the Western livestock industry and communities that are dependent upon productive, healthy public rangelands" (43 CFR § 4100.0–2).

This PRMP/FEIS will review and update the status of lands available or unavailable for livestock grazing, as referred to in 43 CFR 4130.2. When rangeland health assessment, monitoring data, inventory data, or other inputs indicate that changes are needed for resource improvement, these changes will be pursued at the implementation level on a site-specific basis, in accordance with BLM *Land Use Planning Handbook* (H-1601-1).

Issue 7: How can resources such as vegetation, soils, and wildlife be protected, maintained, or restored?

Some resource uses (e.g., grazing, mineral development, OHV use, recreation) can affect the natural function and condition of plant communities that provide habitat for wildlife. A healthy cover of perennial vegetation stabilizes the soil, increases infiltration of precipitation, reduces runoff, provides clean water to adjacent streams, and minimizes noxious weed invasion. Healthy plant communities provide habitat for a variety of wildlife species, including special status species (SSS).

The alternatives address wildlife and wildlife habitat in terms of the interactions of other resources and resource uses (such as oil and gas leasing, OHV area and route designations, and development of rights-of-way [ROW]) with wildlife and its habitat.

The management of habitat for plant and animal species that are listed under the Endangered Species Act (ESA), such as the Mexican spotted owl, Wright fishhook cactus, and Utah prairie dog, as well as other species considered sensitive, such as the Greater sage-grouse and the pygmy rabbit, was raised as an issue by the BLM, other federal and state agencies, and the public. In recognition of the importance of these species, the alternatives address them separately from other wildlife species.

Issue 8: Where is fire desired and not desired, and in which areas could fire be used as a management tool for vegetative treatments?

Drought and beetle infestation in southern Utah have contributed to hazardous fuel loading, increasing the threat of wildfires. Areas of pinyon die-off and dry grasslands have also created areas of higher risk for fire hazard and could require treatment. A fire management plan is to be developed to address high-risk areas, fire prevention, prescribed burns, rehabilitation and restoration, hazardous fuels reduction, and the protection of life and property.

Issue 9: Which lands within the planning area should be identified as targets for acquisition, disposal, or withdrawal?

As mandated by Section 102 (a)(1) of FLPMA (43 U.S.C. § 1701), public lands are retained in federal ownership, the exception being those public lands that have future potential for disposal (e.g., sale or exchange), as described under Section 203(a) and Section 206 of FLPMA (43 U.S.C. §§ 1713 and 1716).

Public lands cannot be effectively administered without legal and physical access. Therefore, public lands have potential for disposal when they are isolated or difficult to manage. Lands that are identified for disposal must meet public objectives, such as community expansion and economic development. Disposals would be accomplished by using a variety of methods, including land sales, land exchange, and sale or lease under the Recreation and Public Purposes (R&PP) Act of 1926. Public lands can be considered for disposal other than through FLPMA sale, on a case-by-case basis. Disposal actions are usually in response to a public request or application and result in a title transfer, wherein the lands leave the public domain. In addition, the BLM will consider acquisition of non-federal lands that meet resource management objectives, through negotiated purchase, donation, or exchange from willing sellers. In a withdrawal of lands, an area of public land is withheld from settlement, sale, location, or entry, for the purpose of limiting activities to maintain other public values.

Although the PRMP/FEIS does not include specific decisions on social and economic factors, the impacts of the management actions contained within the alternatives are analyzed for their impacts on socioeconomic conditions. Social and economic factors are identified in Chapter 3 (Affected Environment) and analyzed in Chapter 4 (Environmental Consequences). Other issues related to resources and resource uses are required to be considered during land use planning efforts, in accordance with BLM *Land Use Planning Handbook* (H-1610-1) and NEPA regulations and policy. These include decisions for soil and water, management of ROWs, environmental justice, and air quality.

1.5.1.2 Issues Considered But Not Further Analyzed

Issues Addressed Through Policy or Administrative Action

Policy or administrative actions include those actions that are implemented by the BLM because they are standard operating procedure, because federal law requires them, or because they are BLM policy. Administrative actions do not require a planning decision to implement. Issues that can be addressed by policy or administrative actions are eliminated from detailed analysis in this planning effort. Such issues include the following:

- Compliance with existing laws and policies (e.g., FLPMA, NEPA, ESA, American Antiquities Act, Clean Air Act of 1970 [CAA], Clean Water Act of 1977 [CWA], National Historic Preservation Act [NHPA]).
- The allocation of forage between livestock and wildlife and the application of specific management practices on allotments within the RFO, as provided for through the application of Utah's *Standards for Rangeland Health, Guidelines for Livestock Grazing Management*, and supporting monitoring data. When monitoring and inventory data indicate a need, changes to the allocation of forage for livestock and wildlife are made after coordination with permittees, the Utah Division of Wildlife Resources (UDWR), and other affected interests to ensure that resource objectives are met. Livestock grazing management practices may also be adjusted to ensure that grazing practices are compatible with other uses of the public lands. These allocation and management adjustments are implementation decisions according to the BLM *Land Use Planning Handbook* (H-1601-1) and are made on an allotment or other site-specific basis.
- Education, enforcement and prosecution, vandalism, and volunteer coordination.
- Assistance in resolving, to the extent possible, inconsistencies between federal and non-federal agency plans, and in establishing consistency with state and local plans to the maximum extent, consistent with federal law and the purposes of FLPMA.
- Management of cultural resources, including up-to-date inventories, non-disclosure of sensitive sites, proposal of cultural sites for the National Register of Historic Places (NRHP), and Native American consultation.

- Management of the RFO's 11 existing WSAs (approximately 446,900 acres) under the *Interim Management Policy (IMP) for Lands Under Wilderness Review* (BLM Handbook H-8550-1). The BLM is statutorily (FLPMA Section 603[c]) required to manage these areas to protect their suitability for congressional designation for the National Wilderness Preservation System unless and until Congress either designates an area as wilderness or releases it from further consideration. The BLM's discretion to make planning decisions about management of WSAs is limited to designating WSAs as visual resource management (VRM) Class I and to determining whether the WSAs will be limited or closed to OHV use.
- Completion of inventory of riparian and wetland areas and the use of monitoring and mitigation to help protect these resources.
- Recreation management improvements, including a comprehensive sign system and maps.
- Administration of existing mineral leases, permits, and other authorized uses.
- Administration of valid existing rights.
- Monitoring wildlife and biodiversity.
- Monitoring air quality.
- Mitigation measures for site-specific projects.
- Noxious weed control.
- Eligibility standards for specially designated areas.
- Protection of threatened, endangered, or sensitive species.
- Coordination with local, state, and federal agencies.
- Cooperation with user groups.

Issues Beyond the Scope of the RMP

Issues beyond the scope of the RMP process include all issues that are not related to decisions that would occur as a result of the planning process. Such decisions include those that are not under the jurisdiction of the RFO or are beyond the capability of the BLM to resolve as part of the planning process. Issues identified in this category include the following:

- The State of Utah and Garfield, Piute, Sanpete, Sevier, and Wayne counties may hold valid existing ROWs in the planning area, pursuant to Revised Statute (RS) 2477, Act of July 28 1866, Chapter 262, 8, 14 Stat. 252, 253, codified at 43 U.S.C. 932. On October 21, 1976, Congress repealed RS 2477 through passage of FLPMA. This RMP does not adjudicate, analyze, or otherwise determine the validity of claimed ROWs. However, nothing in the RMP extinguishes any valid ROW, or alters in any way the legal rights that the state and counties have to assert and protect RS 2477 rights or to challenge in federal court or other appropriate venue any RMP-imposed use restrictions that they believe are inconsistent with their rights.
- New proposals for WSAs or wilderness.
- Activities and uses beyond the jurisdiction of the BLM.
- Changing of existing laws, policies, and regulations.
- Availability of funding and personnel for managing programs.

1.5.2 Planning Criteria

BLM planning regulations (43 CFR 1610) require the preparation of planning criteria preliminary to the development of all RMPs. Planning criteria are the standards, rules, and guidelines that help to guide the planning process. These criteria influence all aspects of the planning process, including inventory and data collection, developing issues to address, formulating alternatives, estimating impacts, and selecting the Proposed RMP. In conjunction with the planning issues, planning criteria ensure that the planning process is focused and incorporates appropriate analyses. Planning criteria are developed from

appropriate laws, regulations, and policies as well as from public participation and coordination with cooperating agencies, other federal agencies, state and local governments, and Native American tribes.

Planning criteria used in the development of this RMP are as follows:

- The RMP will recognize the existence of valid existing rights.
- The RMP will comply with applicable laws, regulations, executive orders, and BLM supplemental program guidance.
- Planning decisions will cover BLM-administered public lands, including split-estate lands for which the Federal Government has retained the sub-surface mineral estate.
- Planning decisions will use and observe the principles of multiple use and sustained yield that are set forth in FLPMA and other applicable law (43 U.S.C. 1701 [c][1]).
- The BLM will use a systematic interdisciplinary approach to achieve integrated consideration of physical, biological, economic, and other sciences (43 U.S.C. 1701 [c][2]).
- Areas potentially suitable for ACEC or other special designations will be identified and, where appropriate, brought forward for analysis in the EIS (43 U.S.C. 1701 [c][3]).
- The BLM will rely on, to the extent it is available, the inventory of public lands, their resources, and other values (43 U.S.C. 1701 [c][4]).
- The BLM will consider present and potential uses of the public lands (43 U.S.C. 1701 [c][5]).
- The BLM will consider the relative scarcity of the values involved and the availability of alternative means (including recycling) and sites for the realization of those values (43 U.S.C. 1701 [c][6]).
- The BLM will consider the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity.
- Decisions in the RMP will comply with applicable pollution control laws, including state and federal air, water, noise, or other pollution standards or implementation plans (43 U.S.C. 1701 [c] [8]).
- To the extent consistent with the laws governing the administration of the public lands (FLPMA 202 b[9]), BLM will be consistent with existing officially adopted and approved resource-related plans, policies, or programs of other federal agencies, state agencies, Native American tribes, and local governments that may be affected (43 CFR 1610.3-1 [c][9]).

1.6 CHANGES FROM THE DRAFT RMP TO THE PROPOSED RMP

Review of and comments on the DRMP/DEIS have resulted in several changes to that document. Changes were in response to a combination of public comments, meetings with cooperating agencies, and changes in BLM policy and management direction. None of the changes described here and further detailed in Appendix 20 meet the regulatory definition for significance in 40 CFR 1508.27(a) and (b) because these changes resulted in minor modifications to what was considered in the DRMP/DEIS and would not greatly affect the impacts analysis. These regulations require an agency preparing a NEPA document to review the changes for significant new circumstances or information relevant to environmental concerns and bearing on the Proposed RMP or its impacts, using context and intensity as the trigger for significance. The BLM has reviewed each change according to this regulatory standard and has determined that none of the changes, individually or collectively, require a supplement to this PRMP/FEIS. The DRMP/DEIS Preferred Alternative (Alternative B) has been revised and renamed the Proposed RMP.

The BLM has made numerous changes between the DRMP/DEIS and PRMP/FEIS. These changes are described in this section and detailed in Appendix 20. The BLM has prepared Appendix 20 to document whether changes between the DRMP/DEIS and the PRMP/FEIS resulted in a significant change in

circumstances or conditions or whether the PRMP/FEIS contains updated information from that which was presented to the public in the DRMP/DEIS. Finally, the BLM wanted to confirm that all changes made to the PRMP/FEIS fall within the range of alternatives that were presented and analyzed in the DRMP/DEIS. If changes that were made to the PRMP/FEIS are outside the range of alternatives that were analyzed in the DRMP/DEIS, this section and Appendix 20 provide an explanation for the need to make the change and the determination of whether the change is or is not significant.

The regulation controlling whether or not a supplement is required is found at 40 CFR 1502.9(c), which provides that agencies:

(1) Shall prepare supplements to either draft or final environmental impact statements if:
   (i) The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or
   (ii) There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impact (as defined by NEPA in 40 CFR 1508.27).
(2) May also prepare supplements when the agency determines that the purposes of the Act will be furthered by doing so.

All changes to the RFO DRMP/DEIS were made in response to public comment and internal review. The majority of the changes were editorial changes made to add clarity to the document. In some cases, alternatives presented in the DRMP/DEIS were modified in the PRMP/FEIS to reflect technical corrections and data updates. In other cases, such as in Chapter 3, incorporation of updated information was necessary to refine the analysis in Chapter 4, which was incomplete or needed augmentation.

1.6.1 Summary of Changes To Decisions Between the Preferred Alternative (Draft EIS) and the Proposed RMP (Final EIS)

The following list identifies some of the specific differences between the Preferred Alternative of the DRMP/DEIS and the Proposed RMP:

- **Air Quality.** Air quality emissions calculations were completed for each alternative.
- **Fish and Wildlife.** Wildlife habitat maps were changed to reflect the most current UDWR data.
- **Livestock Grazing.** Temporary non-renewable use of grazing was added to reduce site-specific fuels (i.e., cheat grass).
- **Non-WSA Lands with Wilderness Characteristics.** Management prescriptions for 12 non-WSA lands with wilderness characteristics areas (78,600 acres) were added to the Proposed RMP to protect, preserve, and maintain their wilderness characteristics.
- **Recreation.**
  - Under the Proposed RMP, the size of the Factory Butte SRMA was increased to 24,400 acres and the size of the Big Rocks SRMA was decreased to 90 acres.
  - Established three RMZs in the Factory Butte SRMA including the OHV Open Play Area RMZ (8,500 acres), the Motorized Touring RMZ (11,300 acres) and the Landmarks RMZ (4,600 acres).
- **Travel Management.**
  - The boundary of the Factory Butte Play Area was adjusted to designate OHV play areas while avoiding sensitive plant species.
  - The size of the Big Rocks Trails Area and the Glenwood Play Area were decreased.
  - The Mayfield Open Area was eliminated from the Proposed RMP.
  - Increased the miles of designated routes by 46 miles.

  - Increased the miles of designated routes with seasonal closures or size/width restrictions by 55 miles.
  - Increased the miles of closed routes by 141 miles.
- **WSRs.** The Fremont River in the Fremont River Gorge would be managed as suitable for inclusion in the NWSRS with a tentative classification of "wild". The Dirty Devil segment was not carried forward as a suitable river for inclusion in the NWSRS.

1.6.2 Summary of Changes Made Between the DRMP/DEIS and the PRMP/FEIS

1.6.2.1 Chapter 1

The following changes were made to Chapter 1, based on public comment and BLM review:

- Revised the language regarding RS 2477.
- Revised the language regarding tar sands, based on the *Programmatic Environmental Impact Statement on Oil Shale and Tar Sands Leasing*.
- Added a section to describe the changes from the DRMP/DEIS to the PRMP/FEIS.
- Revised the PRMP/FEIS based on the UDWR wildlife habitat maps.

1.6.2.2 Chapter 2

The following clarifications/modifications were made to Chapter 2:

- Italicized and added an asterisk and footnote to identify implementation-level decisions.
- Added the Air Quality common to all management actions, based on discussions with the State of Utah.
- Revised the SSS management actions to allow no surface disturbing or otherwise disruptive activities within 2 miles of a greater sage-grouse lek from March 15 to July 15 to protect sage grouse breeding and brood-rearing habitat.
- Revised the SSS management actions to manage oil and gas leasing as open subject to major constraints (NSO) within ½ mile of greater sage-grouse leks.
- Revised the SSS management action to allow no surface disturbing or otherwise disruptive activities in greater sage-grouse winter habitat from December 15 through March 14.
- Added the Minerals and Energy common to all management actions.
- Revised the Lands and Realty management decisions to give land exchanges with the State of Utah priority consideration to resolve inholdings issues.
- Revised the WSA common to all management actions to address ways in WSAs.
- Revised the WSR common to all management actions to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values for which affected river segments were designated.
- Revised the Travel management common to all management actions to allow limitations on the types of vehicles that are allowed on specific designated routes (especially off-road travel in an area that is limited to designated routes), if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, wildlife habitat, cultural, or vegetative resources.
- Revised the Transportation common to all management actions to clarify that the State of Utah may be provided reasonable access to state lands for economic purposes per the Cotter decision, on a case-by-case basis.
- Revised the Vegetation common to all management actions to implement noxious weed and invasive species control actions as per national guidance and local weed management plans.

- Revised the Wildlife common to all management actions to allow for maintenance of the land use plan when minor adjustments to crucial wildlife habitat boundaries are periodically made by the UDWR.
- Revised the Wildlife management actions in the Proposed RMP to allow for compensatory mitigation on an "as appropriate" basis when it can be performed onsite, and on a voluntary basis when it is performed offsite, in accordance with current guidance.
- Clarified the wording for the No Leasing Alternative and the Livestock Grazing Adjustments Alternative that were considered but eliminated from detailed analysis.

1.6.2.3 Chapter 3

The following changes were made to Chapter 3, based on public comment and BLM review:

- Clarified that the Cotter decision would apply in providing access to SITLA lands.
- Added language to recognize the importance of climate change and the potential effects it may have on the natural environment.
- Clarified the limitation of the application of the size criteria for non-WSA lands with wilderness characteristics.

1.6.2.4 Chapter 4

The following changes were made to Chapter 4, based on public comment and BLM review:

- Conducted emissions calculations for each of the Alternatives and the Proposed RMP.
- Added cultural language to describe the Section 106 consultation process.
- Revised the non-WSA lands with wilderness characteristics impact analysis to address lands that are carried forward in the Proposed RMP and those lands that are not carried forward in the Proposed RMP.
- Revised the ACEC section to clarify other resource decisions that provide protection to relevant and important values of potential ACECs. In addition, this section was formatted to be consist with other sections in Chapter 4.
- Revised the cumulative impact analysis section to clarify incremental effects from past, present and future actions.
- Moved the sage grouse impact analysis from the fish and wildlife section to the special status species section.
- Revised the sage grouse impact analysis to address the management action changes described in chapter 2.
- Added to the socioeconomic section an impact analysis from non-WSA lands with wilderness characteristics to Utah School and Institutional Trust Lands Administration (SITLA) lands.
- Added language to address global climate change.

1.6.2.5 Maps

The maps were revised based on public comment and BLM review:

- A disclaimer was added to the wildlife habitat maps to provide the UDWR data publication dates and a reference to the exceptions, waivers, and modifications listed in Appendix 11.
- Included sage-grouse winter habitat on map 3-6.
- Maps were updated to reflect changes in the Proposed RMP and to correct errors.

1.6.2.6 Appendices

The following appendices were added or revised, based on public comment and BLM review:

- **Appendix 11.** The BLM has updated and clarified Appendix 11 Oil and Gas Leasing Stipulations for the Proposed RMP, based on comments and internal review. New lease notices for threatened and endangered (T&E) species created by USFWS have been included. The "Other Scenic Lands" no surface occupancy (NSO) stipulation has been replaced with a CSU stipulation for VRM Class 2. Proposals for surface disturbing activities involving construction on slopes greater than 30 percent would be avoided if possible (subject to CSU) to protect fragile soils throughout the planning area. The BLM specified the conditions for waivers and modifications for wildlife habitat. Added a sage grouse seasonal restriction for 2 miles around leks and added a no surface occupancy stipulation of 1/2 miles around sage grouse leks.
- **Appendix 16.** Summary of Management of Non-WSA Lands with Wilderness Characteristics for the Richfield Field Office Proposed RMP/Final EIS
- **Appendix 17.** Utah Public Lands Study: Key Social Survey Findings for Garfield, Piute, Sanpete, Sevier, and Wayne Counties
- **Appendix 18.** Factory Butte SRMA recreation management zones (RMZs) and Management Prescriptions
- **Appendix 19.** Wildland Fire Resource Protection Measures and Reasonable and Prudent Measures, Terms and Conditions, and Reporting Requirements Identified through Section 7 Consultation
- **Appendix 20.** Summary of Changes from the DRMP/DEIS to the PRMP/FEIS
- **Appendix 21.** State of Utah Air Quality Letter

1.7 RELATIONSHIP TO OTHER PROGRAMS, PLANS, AND POLICIES

1.7.1 Other Related Plans

FLPMA requires that the BLM, when developing or revising LUPs, shall abide by the following:

> *…to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management of activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located…and assure that consideration is given to those State, local and tribal land use plans for public lands [and] assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans…(43 U.S.C. S 1712 [c][9])*

The BLM must keep apprised of the many ongoing programs, plans, and policies that are being implemented in the planning area by other federal, state, local, and tribal governments. The BLM will seek to be consistent with or complementary to other management actions whenever possible. Plans that need to be considered during the RFO's planning effort are identified in Table 1-2.

Table 1-2. Plans to Be Considered in the Richfield Resource Management Plan

Plan Types	Specific Plans
County Plans	Garfield County General Plan, 1998 General Plan for Piute County, 1994

Plan Types	Specific Plans
	Sanpete County General Plan, 1997 Sevier County General Plan, 1998 General Plan for Wayne County, 1994 Utah Comprehensive Wildlife Conservation Strategy (State Wildlife Action Plan), 2005
State of Utah	Statewide Comprehensive Outdoor Recreation Plan (SCORP), 2000 Utah Water Quality Plan
National Forest Plans	Manti-LaSal National Forest Land and Resource Management Plan Dixie National Forest Land and Resource Management Plan Fishlake National Forest Land and Resource Management Plan Uinta National Forest Land and Resource Management Plan
National Park Service Plans	Capitol Reef National Park General Management Plan, 1988 Glen Canyon National Recreation Area General Management Plan Glen Canyon National Recreation Area Grazing Management Plan Canyonlands National Park General Management Plan Glen Canyon National Recreation Area Minerals Management Plan, 1980
Other BLM Surrounding Offices	Kanab Field Office LUPs - Escalante MFP, Paria MFP, Vermilion MFP, Zion MFP and Cedar-Beaver-Garfield-Antimony RMP Cedar City Field Office LUPs, MFPs - Pinyon Grazing EIS (1982), Cedar-Beaver-Garfield-Antimony RMP grazing decisions (1984), Utah BLM Statewide Wilderness EIS (1990) Fillmore Field Office- House Range Resource Management Plan and Warm Springs Resource Management Plan Grand Staircase Escalante National Monument LUP-Monument Management Plan 1999 Price Field Office LUPs-the Price River Resource Area Management Framework Plan and the San Rafael Resource Management Plan Salt Lake Field Office LUPs- Randolph MFP (1980), Box Elder RMP (1986), Pony Express RMP (1990), Park City MFP (1975) and Isolated-Tract Planning Analysis Evaluation (1985)
Habitat Plans	Parker Mountain Habitat Management Plan Henry Mountains Desert Bighorn Sheep Habitat Management Plan Antimony Habitat Management Plan
Threatened and Endangered Species Recovery Plans	Maguire Daisy Recovery Plan, 1995 Mexican Spotted Owl Recovery Plan, 1995 Utah Reed-Mustards Recovery Plan, 1994

Plan Types	Specific Plans
	Last Chance Townsendia Recovery Plan, 1993 Northern States Bald Eagle Recovery Plan, 1983 Wright Fishhook Cactus Recovery Plan, 1985 Southwest Willow Flycatcher Recovery Plan, 2001 Utah Prairie Dog Recovery Plan, 1991 Utah Prairie Dog Interim Conservation Strategy, 1997 Central Utah Navajo Sandstone Endemics Conservation Agreement, 2006 Conservation Agreement and Strategy for the Bonneville Cutthroat Trout, 1997 Conservation Agreement for the Colorado River Cutthroat Trout, 2006 Range-Wide Conservation Agreement for Roundtail Chub Gila robusta, Bluehead Sucker Catostomus discobolus, and Flannelmouth Sucker Catostomus latipinnis, 2004 Conservation Strategy and Agreement for the Management of Northern Goshawk Habitat in Utah, 1999
BLM Programmatic Environmental Analyses	Programmatic Environmental Impact Statement on Oil Shale and Tar Sands Leasing West-wide Energy Corridor Programmatic EIS Utah Land Use Plan Amendment for Fire and Fuels Management, 2005 Wind Energy Programmatic Environmental Impact Statement, 2005 Vegetation Treatments on BLM Lands in 17 Western States Programmatic Environmental Report, 2007 Vegetation Treatments Using Herbicides in 17 Western States Programmatic Environmental Impact Statement, 2007 Final Environmental Impact Statement Vegetation Treatment on BLM Lands in Thirteen Western States and associated Records of Decision, 1991

Consistency with national forest plans is ongoing because three of the four national forests that share boundaries with the RFO are revising their LUPs. In developing their respective management plans, the USFS and BLM have coordinated OHV area and route designations, potential WSR evaluations, and other resources of mutual concern.

1.7.2 Energy Policy and Conservation Act

In May 2001, the Bush administration's Comprehensive National Energy Policy was issued. This Policy directed the Secretary of the Interior to do the following:

> *… examine land status and lease stipulation impediments to Federal oil and gas leasing, and review and modify those where opportunities exist (consistent with the law, good environmental practice and balanced use of other resources).*

Under this directive, the Assistant Secretary of the Interior for Land and Minerals Management delivered to Congress an inventory of U.S. oil and gas resources in five western basins, as well as a description of

the extent and nature of any restrictions or impediments to their development. This report was prepared at the request of Congress under the provisions of the 2000 Energy Policy and Conservation Act (EPCA).

In April 2003, the BLM Washington Office (WO) issued an Instruction Memorandum (IM No. 2003-233) which requires the integration of EPCA inventory results in the land use planning process. The IM establishes direction, consistent with FLPMA, to enhance BLM's ability to protect the environment and other resources, as well as facilitates energy development, where appropriate. The IM outlines strategy for integrating the EPCA inventory results into land use plans, restates BLM's commitment to providing responsible and balanced access to the public lands for energy exploration and development; and reinforces BLM's obligation to monitor and adaptively manage public lands and resources.

In August 2005, the Bush administration's national energy plan was issued which encourages energy efficiency and conservation, promotes alternative and renewable energy sources, reduces our dependence on foreign sources of energy, increases domestic production, modernizes the electricity grid, and encourages the expansion of nuclear energy.

1.7.3 Tar Sands and Oil Shale Resources Programmatic EIS

The RFO contains areas of tar sands resources. These resources have been and are available for lease under the Combined Hydrocarbon Leasing Act of 1981 and in accordance with the decisions in the existing BLM LUPs.

The major tar sand resources lay only in Utah, within 11 designated Special Tar Sands Areas (STSA) managed by the BLM's Vernal, Price, Richfield, and Monticello Field Offices (FO). The RFO manages one of these STSAs. One of these STSAs lies within the Grand Staircase-Escalante National Monument where leasing is prohibited.

When the Richfield RMP was initiated in 2001, there was no reasonably foreseeable development expectation for tar sands over the life of the plan. The mineral report identified these resources but did not foresee any leasing or development because of prevailing and anticipated economic factors.

Since the start of this RMP revision, Congress has enacted the Energy Policy Act of 2005. Section 369 of the Energy Policy Act requires the Secretary of the Interior to "complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming." On December 13, 2005, the BLM published an NOI in the *Federal Register,* initiating a Programmatic Environmental Impact Statement (PEIS) to support a commercial oil shale and tar sands leasing program on federal lands in those three states. Since that time, the scope of the PEIS has been revised. The BLM is no longer using the PEIS as the document that supports the NEPA requirements for leasing. Given that the development technologies for in-situ production of oil shale are just emerging, there is a lack of information regarding resource use and associated impacts. Consequently, the BLM has changed this document to a resource allocation document that identifies the BLM-managed lands for which applications to lease oil shale and tar sands resources would be accepted in the future. However, although applications would be accepted, additional NEPA analysis would be performed before any leasing of the area would be considered.

All decisions related to land use planning decisions (i.e., regarding areas open to application for potential leasing) for tar sands resources in this RMP will be made in accordance with the ongoing PEIS for Oil Shale and Tar Sands Resources. The ROD on the Final PEIS will amend the PRMP/FEIS by making land use planning decisions based on whether or not lands will be available for future application, leasing, and

development of tar sands on public lands for those areas where the resource is present. Additional site-specific NEPA analysis would be completed on each lease application before any leases would be issued.

As part of the site-specific NEPA analysis, the environmental consequences of specific resource values and uses within the areas and any alternative actions would be analyzed. Any decision to offer the lands for lease would be based on a full disclosure of the impacts. If a decision were made to offer the lands for lease, specific mitigation measures would be developed to ensure that the commercial operations use practices that minimize or mitigate impacts.

This pre-leasing NEPA analysis would include the same opportunities for public involvement and comment that are part of this PEIS process and every other land use planning and NEPA process that the BLM undertakes. The decisions associated with the PEIS will be incorporated into the RFO RMP as it is finalized, or the RFO RMP will be amended. Additional opportunities for public involvement and comment will occur when the Proposed RMP Amendment/Final PEIS is available.

However, this RMP will develop allocation decisions for conventional oil and gas leasing and the Combined Hydrocarbon Leases (CHL) in the STSAs.

1.7.4 West-wide Energy Corridor Programmatic EIS

Section 368 of the Energy Policy Act of 2005 (designation of west-wide energy corridors) is being implemented through the current development of an interagency PEIS. The PEIS will address numerous energy corridor–related issues, including the utilization of existing corridors (i.e., enhancements and upgrades), identification of new corridors, supply and demand considerations, and compatibility with other corridor and project planning efforts. It is likely that the identification of corridors in the PEIS will affect the RFO, and the decisions in the Approved PEIS will be carried forward into the Approved RMP, or, depending on timing, the PEIS will amend the RFO RMP.

1.7.5 Utah Land Use Plan Amendment for Fire and Fuels Management

The decisions that were reached through the *Utah Land Use Plan Amendment for Fire and Fuels Management* process, approved in September 2005, are common to all alternatives, and the analysis is incorporated by reference. The fire plan amendment does the following:

- Establishes landscape-level fire management goals and objectives
- Describes desired wildland fire conditions (DWFC) by Fire Regime Condition Class (FRCC) and describes the management strategies and actions to meet DWFC and land use allocations
- Describes areas in which fire may be restored to the ecosystem through wildland fire use for resource benefit and areas in which wildland fire use is not appropriate
- Identifies criteria that would be used for establishing fire management priorities
- Identifies maximum burned areas and treatment acres for wildfire, wildland fire use for resource benefit, prescribed fire treatments, non-fire fuel treatments, and emergency stabilization and rehabilitation (ESR) actions

1.7.6 Wind Energy Programmatic EIS

The ROD for the *Wind Energy Development Programmatic Environmental Impact Statement*, which implements a comprehensive wind energy development program to administer the development of wind energy resources on BLM-administered public lands in 11 western states (including Utah), was approved

in December 2005. The decisions that were reached through the Wind Energy Development PEIS process are common to all alternatives in the RFO RMP, and the analysis is incorporated by reference. The decision established policies and best management practices (BMP) for the administration of wind energy development activities and established minimum requirements for mitigation measures.

CHAPTER 2—ALTERNATIVES

2.1 INTRODUCTION

This chapter describes the Proposed RMP that was crafted primarily from the Preferred Alternative in the Draft Resource Management Plan/Draft Environmental Impact Statement (DRMP/DEIS) (Alternative B) as well as from other decisions within the range of alternatives presented in the DRMP/DEIS, including the No Action Alternative N and Alternatives A, C, and D. The No Action Alternative N and Alternatives A, C, and D are repeated from the DRMP/DEIS into the Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS) for comparative purposes and to correct minor deficiencies pointed during the DRMP/DEIS public comment period and from internal review. The changes from the Preferred Alternative (Alternative B in the Draft RMP/EIS) to the Proposed RMP have been highlighted gray.

Evaluation of a reasonable range of alternatives is required by National Environmental Policy Act (NEPA) and the Council on Environmental Quality (CEQ) regulations (40 Code of Federal Regulations [CFR] Part 1502.14), as well as by BLM planning regulations. As required in the CEQ regulations, the reasonable range must include a "no action" alternative (CEQ 1981, Question 3.A), which is the continuation of current management under the *Mountain Valley Management Framework Plan (MFP)* (1982), the *Henry Mountain MFP* (1982), the *Parker Mountain MFP* (1982), the *Cedar-Beaver-Garfield-Antimony Resource Management Plan (RMP)* (1986), the *Forest MFP* (1977), and the *San Rafael RMP* (1991), as well as subsequent plan amendments.

The BLM recognizes that social, economic, and environmental issues cross land ownership lines and that extensive cooperation is needed to actively address issues of mutual concern. To the extent possible, these alternatives were crafted using input from public scoping comments and cooperating agencies.

Once the alternatives were developed, the BLM analyzed them to predict their impacts on the environment. Based on the impacts analysis of these alternatives, along with knowledge of specific issues raised throughout the planning process, input from cooperating agencies and BLM resource specialists, consideration of planning criteria, and potential resolution of resource conflicts, the BLM has identified the Proposed RMP. Each alternative provides a different emphasis for managing public lands and resources within the planning area, and each alternative represents a complete and reasonable RMP that: 1) meets the purpose and need described in Chapter 1; 2) responds to environmental, operational, and economic concerns raised by the public, agencies, business, and other special interest groups during the scoping process; and 3) addresses potential environmental issues identified during review of the proposed management actions.

2.2 ALTERNATIVE COMPONENTS

The alternatives and the Proposed RMP described in this chapter represent varying approaches to addressing and resolving key planning issues (Chapter 1) and to managing resources and resource uses in the planning area. Each comprises two categories of land use planning decisions: (1) desired outcomes (goals and objectives) and (2) allowable uses and management actions that are anticipated to achieve the desired outcomes. These two categories are discussed below.

2.2.1 Desired Outcomes (Goals and Objectives)

Goals and objectives provide overarching direction for BLM actions in meeting the agency's legal, regulatory, policy, and strategic requirements. Goals are broad statements of desired outcome but generally are not measurable. Objectives are more specific statements of a desired outcome that may include a measurable component. In general, the objectives are anticipated to achieve the stated goals.

2.2.2 Allowable Uses and Management Actions

After establishing desired outcomes, the BLM identifies allowable uses (i.e., land use allocations) and management actions for different alternatives that are anticipated to achieve the desired outcomes (i.e., goals and objectives). Alternatives were developed to address planning issues, resolve resource conflicts, improve consistency, and ensure resource-specific decisions for the following categories in the RMP revision process: 1) physical, biological, and cultural resources; 2) resource uses; and 3) special designations.

Allowable uses identify where land uses are allowed, restricted, or prohibited on all BLM-administered surface and federal mineral estate in the planning area. Alternatives may include specific land use restrictions to meet goals and objectives and may exclude certain land uses to protect resource values. For example, alternatives considered for this Proposed RMP close all suitable wild and scenic river segments to oil and gas leasing. Because the alternatives identify whether particular land uses are allowed, restricted, or prohibited, allowable uses often include a spatial (e.g., map) component.

Management actions are those actions anticipated to achieve desired outcomes. These actions include proactive measures (e.g., measures taken to maintain, restore, or improve land health), as well as measures or criteria that would be applied to guide day-to-day activities occurring on public land.

Although anticipated to achieve desired outcomes, the components described above may not be achieved during the planning period because of limitations in funding or staffing, changing policies or priorities, or new information. These factors could also affect the rate of RMP implementation. It is important to note that the RMP is strategic in nature, and, while it provides an overarching vision for managing resources in the planning area, it also allows management flexibility in light of changing priorities, information, and circumstances.

2.3 ALTERNATIVES CONSIDERED IN DETAIL

2.3.1 Overview of the Alternatives

The BLM identifies and analyzes the Proposed RMP in the PRMP/FEIS. The BLM does not carry forward the DRMP/DEIS Alternative B (the Preferred Alternative) into the PRMP/FEIS Proposed RMP. Rather the Proposed RMP consists of a combination of all the alternatives, including Alternative B in response to public comments and internal review. While, the Proposed RMP was crafted primarily from Preferred Alternative in the DRMP/DEIS (Alternative B), it is important to note that other decisions within the range of alternatives presented in the DRMP/DEIS, including the No Action Alternative and Alternatives A, C, and D that have been incorporated into the PRMP/FEIS as well. The DRMP/DEIS Alternative B has been removed from the PRMP/FEIS. The BLM only identifies and analyzes the Proposed RMP in the PRMP/FEIS. The other DRMP/DEIS Alternatives N, A, C and D and analysis are just carried forward in the PRMP/FEIS for comparative purposes and to correct some of the mistakes that were identified during the public comment period.

This section summarizes four DRMP/DEIS alternatives and the Proposed RMP. It includes a brief description of each plus a comparative summary of proposed LUP decisions by alternative (Section 2.6).

2.3.1.1 Alternative N (No Action Alternative)

Alternative N represents the continuation of current management under the existing six LUPs, as amended. The existing LUPs are the *Mountain Valley MFP* (1982), the *Henry Mountain MFP* (1982), the *Parker Mountain MFP* (1982), the *Cedar-Beaver-Garfield-Antimony RMP* (1986), the *Forest MFP* (1977), and the *San Rafael RMP* (1991). Alternative N provides the baseline against which to compare the other alternatives. It includes existing Areas of Critical Environmental Concern (ACEC) (four areas totaling 14,780 acres) and eligible wild and scenic river segments (WSR) (12 segments totaling 135 miles). None of the eligible segments would be found suitable for congressional designation to the National Wild and Scenic Rivers System. Alternative N is the least restrictive to off-highway vehicle (OHV) use.

2.3.1.2 Alternative A

Alternative A emphasizes commodity production, and mineral extraction—mining, oil and gas leasing, grazing, commercial recreation, and commercial woodland products harvesting—and motorized recreation. Compared with all other alternatives, Alternative A conserves the least land area for physical, biological, and cultural resources and proposes the least special designations (no suitable WSR segments; no ACECs).

2.3.1.3 Proposed RMP

The Proposed RMP has been identified by BLM because it represents an attempt to balance protection/conservation of physical, biological, and cultural resources while providing for commodity production and mineral extraction. The Proposed RMP designates ACECs (two areas totaling 2,530 acres) recommends a WSR segment (5 miles), and manages non-Wilderness Study Area (WSA) lands for wilderness characteristics (78,600 acres).

2.3.1.4 Alternative C

Alternative C emphasizes conservation of physical, biological, and cultural resources over commodity production, mineral extraction, and motorized recreation access. Alternative C (along with Alternative D) designates the most ACECs (16 areas totaling 886,810 acres) and recommends the most eligible WSR segments (12 segments totaling 135 miles) as suitable for congressional designation to the National Wild and Scenic Rivers System.

2.3.1.5 Alternative D

Alternative D emphasizes conservation of physical, biological, and cultural resources over commodity production, mineral extraction, and motorized recreation access. Compared with all alternatives, Alternative D conserves the most land area for physical, biological, and cultural resources; (along with Alternative C) designates the most ACECs (16 areas totaling 886,810 acres) and recommends the most eligible WSR segments (12 segments totaling 135 miles) as suitable for congressional designation to the National Wild and Scenic Rivers System; and emphasizes management of non-WSA lands with wilderness characteristics (682,600 acres), in order to protect, preserve, and maintain their wilderness characteristics. Except for management of lands with wilderness characteristics, decisions under Alternative D are the same as under Alternative C.

2.4 ADAPTIVE MANAGEMENT

Adaptive management is a formal, systematic, and rigorous approach to learning from the results of management actions, accommodating change, and improving management. It involves synthesizing existing knowledge, exploring alternative actions, and making explicit forecasts about their results. Management actions and monitoring programs are carefully designed to generate reliable feedback and clarify the reasons underlying results. Actions and objectives are then adjusted based on this feedback and improved understanding to continue to try to achieve the desired outcomes. In addition, decisions, actions, and results are carefully documented and communicated to others so that knowledge gained through experience is passed on rather than lost when individuals move or leave the organization.

LUP-level decisions would not be immediately adaptable. These include the goals and objectives, allowable uses, management actions, and special designations. Plan amendments would be required to change these decisions. Implementation- or activity-level decisions could be subject to adaptive management. Future activity-level plans would follow NEPA procedures and involve the public.

This PRMP/FEIS recommends an adaptive management strategy. The adaptive management process is flexible and generally involves four phases: planning, implementation, monitoring, and evaluation. As the BLM obtains new information, it is able to evaluate monitoring data and other resource information to periodically refine and update desired outcomes (goals and objectives), management actions, and allowable uses. This allows continual refinement and improvement of management prescriptions and practices.

2.5 ALTERNATIVES CONSIDERED BUT ELIMINATED FROM DETAILED ANALYSIS

This section provides a summary of two alternatives the BLM considered but eliminated from detailed analysis, as well as the reasons for not analyzing them in detail.

2.5.1 No Grazing Alternative

An alternative that proposes to make the entire RFO unavailable for grazing would not meet the purpose and need of this PRMP/FEIS. NEPA requires that agencies study, develop, and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources. No issues or conflicts have been identified during this land use planning effort that require the complete elimination of grazing within the planning area for their resolution. Where appropriate, removal of livestock and adjustments to livestock use have been incorporated in this planning effort. Because the BLM has considerable discretion through its grazing regulations to determine and adjust stocking levels, seasons-of-use, and grazing management activities, and to allocate forage to uses of the public lands in RMPs, the analysis of an alternative to entirely eliminate grazing is not needed.

An alternative that proposes to make the entire planning area unavailable for grazing would also be inconsistent with the intent of the Taylor Grazing Act, which directs the BLM to provide for livestock use of BLM lands; to adequately safeguard grazing privileges; to provide for the orderly use, improvement, and development of the range; and to stabilize the livestock industry dependent upon the public range.

FLPMA requires that public lands be managed on a “multiple use and sustained yield basis” (FLPMA 43 United States Code [U.S.C.] Section 302 (43 U.S.C. 1732)(a) and Section 102 (43 U.S.C. 1701)(7)) and includes livestock grazing as a principal or major use of public lands. While multiple use does not require

that all lands be used for livestock grazing, complete removal of livestock grazing in the entire planning area would be arbitrary and would not meet the principle of multiple use and sustained yield.

Livestock grazing is and has been an important use of the public lands in the planning area for many years and is a continuing government program. The CEQ guidelines for compliance with NEPA require that agencies analyze the "No Action Alternative" in all EISs (40 CFR 1502.14(d)). For the purposes of this NEPA analysis, the "no action alternative" is to continue the status quo, which includes livestock grazing. For this reason and those stated above, the RFO dismissed a no grazing alternative for the entire planning area from further consideration in this PRMP/F EIS.

2.5.2 No Leasing Alternative

During scoping and/or the comment period for the DRMP/DEIS, it was suggested that the BLM should address a "No-Leasing Alternative" because the "No-Leasing Alternative" is the equivalent of the "No Action Alternative" that must be analyzed in all EISs.

The "No-Leasing Alternative" in an RMP revision is actually an action alternative because where lands have already been leased, the no-action for NEPA purposes continues to allow for (honor) valid existing rights. Proposing a "No-Leasing Alternative" would require revisiting existing leases and either buying them back from the lessee or allowing them to expire on their own terms. The first option (buying back), is outside the scope of any RMP. This is a political decision that the BLM has no authority to undertake in planning. As a result, the BLM does not regularly include a "No-Leasing Alternative."

The purpose and need for the LUP is to identify and resolve potential conflicts between competing resource uses rather than to eliminate a principal use of the public lands in the RFO. Leasing the public lands for oil and gas exploration and production is required by the Mineral Leasing Act of 1920, as amended, and the BLM's current policy is to apply the least restrictive management constraints to the principal uses of the public lands necessary to achieve resource goals and objectives. A field office-wide "No-Leasing Alternative" would be an unnecessarily restrictive alternative for mineral exploration and production on the public lands.

NEPA (Section 102 (E)) requires that agencies "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources." No issues or conflicts have been identified during this land use planning effort that require the complete elimination of oil and gas leasing within the planning area for their resolution. The BLM's Land Use Planning Handbook (BLM Manual Rel. 1-1693), Appendix C, item H, requires that LUPs identify areas as open or unavailable for leasing.

Given the potential range of decisions available in the DRMP/DEIS, the analyzed alternatives include no leasing for certain areas; but a field office-wide "No-Leasing Alternative" is not necessary to resolve issues and protect other resource values and uses.

As mentioned above, a "No-Leasing Alternative" should not be confused with the "No Action Alternative" for purposes of NEPA compliance. Leasing and No Leasing on the public lands has previously been analyzed in several NEPA documents. In 1973, the Department of the Interior (USDI) published the *Final Environmental Impact Statement on the Federal Upland Oil and Gas Leasing Program* (USDI, 1973). The proposed action was to lease federal lands for production of oil and natural gas resources. Alternatives included the No Action Alternative, which at initiation of the program was "No Leasing." To supplement that EIS, the BLM prepared a series of Environmental Assessments (then titled Environmental Analysis Records or EARs) including the *Richfield Oil and Gas Program Environmental Analysis Record (EAR), 1975–76*, which addressed oil and gas leasing for the public lands

in the RFO area. Alternatives again included the No Action or "No Leasing" alternative. The outcome was a category system for leasing that categorized all public and United States Forest Service (USFS) lands into four groups: 1) open to leasing with standard lease stipulations, 2) Special Stipulations to address special concerns, 3) NSO and 4) No Leasing. Since completion of the EAR in 1975–76, oil and gas leasing in the RFO has been an ongoing federal program under the established categories.

The CEQ (Section 1502.14(d) of NEPA) requires the alternatives analysis in an EIS to "include the alternative of no action" but explains that there are two distinct interpretations of "no action" that must be considered, depending on the nature of the proposal being evaluated. "The first situation might involve an action such as updating a land management plan where ongoing programs initiated under existing legislation and regulations will continue, even as new plans are developed. In these cases 'no action' is 'no change' from current management direction or level of management intensity. To construct an alternative that is based on no management at all would be a useless academic exercise. Therefore, the 'no action' alternative may be thought of in terms of continuing with the present course of action until that action is changed." (CEQ Forty Most Asked Questions, Question 3). Therefore, for the RFO DRMP/EIS, the "No-Action Alternative" is to continue the status quo, which is to lease under the oil and gas stipulations (formerly categories) established in the *Mountain Valley MFP* (1982), the *Henry Mountain MFP* (1982), the *Parker Mountain MFP* (1982), the *Cedar-Beaver-Garfield-Antimony RMP* (1986), the *Forest MFP* (1977), and the *San Rafael RMP* (1991), as well as subsequent plan amendments.

2.5.3 Livestock Grazing Adjustments Alternative

During scoping and comment on the DRMP/EIS, it was suggested that the BLM consider adjustments to livestock numbers, livestock management practices, and the kind of livestock grazed on allotments within the RFO to benefit wildlife and protect and promote land health, including soils, hydrologic cycles, and biotic integrity.

BLM policy regarding adjustments to the levels of livestock use authorized is to monitor and inventory range conditions under existing stocking levels and make adjustments to livestock use as indicated by this data to help assure that the Utah Standards for Rangeland Health and resource objectives are met. Regulations at 43 CFR 4130.3 require that the terms and conditions under which livestock are authorized "ensure conformance with the provisions of subpart 4180" (Standards for Rangeland Health) and further, that "livestock grazing use shall not exceed the livestock carrying capacity of the allotment." It would be inappropriate and unfeasible to estimate and allocate the available forage, design specific management practices, and determine if changes to the kind of livestock are necessary for each allotment in the RFO or in the area as a whole in the RMP/EIS. Such changes would not be supportable considering the type and amount of data required and the analysis necessary to make such changes.

According to BLM policy, decisions regarding authorized livestock use levels and the terms and conditions under which they are managed is an implementation decision (H-1610-1, Appendix C, Page 15). BLM range condition according to the Utah Standards for Rangeland Health conducts monitoring and inventories, and evaluates this data on a periodic basis, normally on an allotment and/or watershed basis. After NEPA analysis, necessary changes to livestock management and implementation of Utah's Guidelines for Rangeland Management are implemented through a proposed decision in accordance with 43 CFR 4160. These decisions determine the exact levels of use by livestock in conformance with the LUP and to meet resource objectives and maintain or enhancing land health. For these reasons the Livestock Grazing Adjustments alternative has been dismissed from further consideration in this LUP revision.

2.5.4 SUWA Alternative

In November 2003, the Southern Utah Wilderness Alliance (SUWA) submitted to the BLM an outline and map for an RMP alternative. It divided the lands managed by the RFO into management zones and provided brief prescriptions for managing each zone. While it provided an outline for management, it fell short of a fully developed alternative because it did not address and attempt to resolve the issues raised during scoping nor the multiple laws, regulations, and policies that BLM must consider in developing an RMP. Consequently, the SUWA Alternative does not meet the purpose and need for this plan revision, and it is largely inconsistent with the FLPMA's multiple use sustained yield mandate. For these reasons, the RFO dismissed the SUWA Alternative from further consideration in this PRMP/FEIS. However, elements of it are included in Alternatives C and D.

2.6 PROPOSED RMP AND DRAFT RMP ALTERNATIVES DECISION TABLES

The following tables present the details of the proposed management for each resource, resource use, and special designation for the Proposed RMP and DRMP/DEIS Alternatives.

2.6.1 Natural, Biological, and Cultural Resources

Air Quality

Table 2-1. Air Quality

Desired Outcomes (Goals and Objectives)
• Ensure authorizations and management activities comply with local, state, and federal air quality regulations, requirements, and implementation plans. • Manage all BLM and BLM-authorized activities to maintain air quality within the thresholds established by the NAAQS and ensure that those activities continue to keep the area in attainment, meet PSD Class II standards, and protect the Class I airsheds. • Manage BLM and BLM-authorized activities to comply with the Utah Enhanced Smoke Management Plan, August 11, 2003, and the Utah State Law R307-204 Emission Standards: Smoke Management, August 1, 2007. • Minimize the impact of management actions in the planning area on air quality by complying with all applicable air quality laws, rules and regulations. • Maintain concentrations of criteria pollutants associated with management actions in compliance with applicable State and Federal Ambient Air Quality Standards (AAQS). • Maintain concentrations of Prevention of Significant Deterioration (PSD) pollutants associated with management actions in compliance with the applicable increment.
Issue: Management of Air Quality
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• Mitigate potential adverse impacts of site-specific actions identified in NEPA documents prepared at the time an action is proposed, through best available control technology as part of the state permitting process and PSD review. • BLM will continue to work cooperatively with state, federal, and tribal entities in developing air quality assessment protocols to address cumulative impacts and regional air quality issues. • BLM will continue to work cooperatively with the Utah Airshed Group to manage emissions from wildland and prescribed fire activities. • National Ambient Air Quality Standards are enforced by the Utah Department of Environmental Quality, Division of Air Quality (UDEQ-DAQ), with EPA oversight. Special requirements to reduce potential air quality impacts will be considered on a case-by-case basis in processing land use authorizations. • BLM will utilize BMPs and site specific mitigation measures, when appropriate, based on site specific conditions, to reduce emissions and enhance air quality. Examples of these types of measures can be found in the Four Corners Air Quality Task Force Report of Mitigation Options, November 1, 2007. • Project specific analyses will consider use of quantitative air quality analysis methods (i.e. modeling), when appropriate as determined by BLM, in consultation with state, federal, and tribal entities. • Mitigate actions that compromise ambient air quality standards or visibility within the Class I airsheds.

Soil Resources

Table 2-2. Soil Resources

Desired Outcomes (Goals and Objectives)				
• Maintain or improve soil quality and long-term soil productivity through implementation of Standards for Rangeland Health and other soil protection measures. • Manage uses to minimize and mitigate damage to soils. • Manage soil resources to: – Maintain or increase soil productivity – Prevent or minimize accelerated soil erosion – Prevent or minimize flood and sediment damage, as needed – Reduce resource loss from floods and erosion – Maintain vegetation cover at or above the level necessary to avoid accelerated soil erosion.				
Issue: Protection of Soil Resources				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Proceed with surface disturbance and reclamation activities consistent with current authorizations and subject to the following: • Utah Standards for Rangeland Health would be followed to maintain or improve soil conditions. • Activities would be the minimum necessary to accomplish the task. • Reclamation would be required for road realignments. • Measures to stabilize soils and minimize surface water runoff would be required, both during project activities and following project completion. • Reclamation of all surface disturbances would be initiated during or immediately upon completion of the authorized project. Reclamation could include recontouring the disturbed area to blend with the surrounding terrain, ripping compacted areas, replacement of topsoil, seeding, planting, and/or providing effective ground cover.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Not specifically addressed in existing plans.	• Implement appropriate BMPs designed to protect water quality for all ground disturbing activities (Appendix 14). • Close and reclaim all temporary roads immediately upon completion of the project. Reclaimed roads could be barricaded or signed until reclamation objectives were achieved. • Remove facilities or improvements no longer necessary reclaim them, provided no historic properties would be affected.			

Water Resources

Table 2-3. Water Resources

Desired Outcomes (Goals and Objectives)
• Maintain and/or restore overall watershed health and reduce erosion, stream sedimentation, and salinization of water. • Work to improve water quality on listed streams and prevent listing of additional streams under the Clean Water Act, Section 303(d) (Appendix 4). • Improve quality and quantity of water in all streams, with particular emphasis on streams with populations of native species, or with non-native game fish, as well as other aquatic species. • Maintain and/or restore the chemical, physical, and biological integrity of the planning area's waters. • Protect community watersheds and sources of culinary water. • Avoid adverse impacts to floodplains. • Restore and preserve the natural and beneficial values served by floodplains in carrying out BLM's responsibilities for acquiring, managing, and disposing of federal lands and facilities (Executive Order 11988, Floodplain Management). • Manage resources to reduce salinity loading where possible and make progress toward accomplishing the goals and objectives outlined in the Colorado River Salinity Control Act.
Issue: Water Quality and Quantity
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
Implement appropriate BMPs designed to protect water quality for all ground disturbing activities (Appendix 14).
Surface water: • Utah DEQ-Division of Water Quality identifies impaired watersheds for which total maximum daily loads (TMDL) must be developed. BLM will continue to cooperate and contribute to both the completion of the TMDL process and implementation of recommendations in the final reports.
Recreational water standards: • Maintain or improve water quality and quantity for recreational uses
Municipal watershed areas: • Manage culinary water sources to preserve the quality and health of water sources.
Public water systems: • Continue to operate and maintain public drinking water systems at BLM facilities to comply with transient non-community water system requirements as defined by State of Utah Administrative Code 309—Water Quality Monitoring Standards. The RFO would continue to gather source samples for laboratory analysis when the water system is operating (seasonal use), including coliform samples quarterly; nitrates yearly; and nitrite/sulfate every 3 years. • Identify public water systems with surface water or ground water sources (e.g., delineated drinking water source protection zones) that may be affected by BLM-authorized activities. Ensure that BLM-authorized activities do not pose a threat to public water systems.

Issue: Protection of Groundwater				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Maintain a 500-foot buffer zone of no surface disturbance and/or occupancy around natural springs to protect water quality.	Maintain buffer zones of no surface disturbance and/or occupancy around natural springs unless it can be shown that (1) there are no practical alternatives, or (2) all long-term impacts can be fully mitigated, or (3) the activity will benefit and enhance the riparian area. Base the size of the buffer zone on geohydrological, riparian, and other factors necessary to protect the water quality of the springs. If these factors cannot be determined, maintain a buffer zone of the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater.		Maintain buffer zones of no surface disturbance and/or occupancy around natural springs unless it can be shown that (1) there are no practical alternatives, or (2) all long-term impacts can be fully mitigated, or (3) the activity will benefit and enhance the riparian area. Base the size of the buffer zone on geohydrological, riparian, and other factors necessary to protect the water quality of the springs. If these factors cannot be determined, maintain a 660-foot buffer zone from the outer edge.	

Vegetation

Table 2-4. Vegetation Decisions

Desired Outcomes (Goals and Objectives)				
• Manage and mitigate activities to restore, sustain, and enhance the health of plant associations. • Manage all resources and resource uses to achieve the Standards for Rangeland Health. • Enhance and/or restore native and desirable naturalized plant species. • Manage for a mix of vegetative types, structural stages, and landscape and riparian functions, and provide for native plant, fish, and wildlife (including SSS) habitats. • Enhance biological and genetic diversity of natural ecosystems. • Maintain relict vegetation communities. • Sustain or reestablish the integrity of the sagebrush biome to provide the amount, continuity, and quality of habitat that is necessary to maintain sustainable populations of the Greater sage-grouse and other sagebrush-dependent wildlife species. • Manage all riparian areas to maintain, restore, or improve unique habitat characteristics, including diversified plant species composition, plant species structural diversity, and adequate native vegetative cover and density for stream bank stabilization. All riparian areas would be managed to be in properly functioning condition.				
Issue: Overall Vegetation Management				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• Treat areas determined to need reseeding with a variety of plant species that are desirable for wildlife habitat, livestock, watershed management, and other resource values while maintaining vegetation species diversity. • Where appropriate, require on-site mitigation when surface disturbance cannot be avoided on a site-specific basis. The BLM will approach compensatory mitigation on an "as appropriate" basis where it can be performed on-site, and on a voluntary basis where it is performed off-site, or, in accordance with current guidance. • Maintain existing vegetative treatments to provide suitable habitats for wildlife and adequate forage for livestock.				
Issue: Vegetation Treatments				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Manipulate vegetation using mechanical, wildland and/or prescribed fire, and chemical treatments on a case-by-case basis to achieve or maintain Standards for	Maintain existing vegetation treatments and implement additional treatments (including prescribed fire and wildland fire use, mechanical, biological, manual, and	Maintain existing vegetation treatments and implement additional treatments (e.g., prescribed fire and wildland fire use, mechanical, biological, manual, and	Allow only natural processes (e.g., prescribed fire and wildland fire use, disease, and insects) to achieve or maintain Standards for Rangeland Health and desired vegetation condition. Vegetation treatments could be conducted on up to 520,000 acres over the life of the plan. (An annual average of 26,000 acres would need to receive treatment to reach the

No action.	No action.	Allow temporary non-renewable use of targeted grazing to reduce site-specific fuels and/or noxious and invasive weeds (e.g. cheat grass).	No action.
The use and perpetuation of native species would be emphasized. However, when restoring or rehabilitating disturbed or degraded rangelands, non-intrusive, non-native plant species would be considered appropriate for use where	The use and perpetuation of native species would be emphasized. However, when restoring or rehabilitating disturbed or degraded rangelands, non-intrusive, non-native plant species may be used where native species: • Are not available • Are not economically feasible • Cannot achieve desired conditions, desired plant communities (DPC), or other ecological objectives as well as non-native species, and/or • Cannot compete with already established non-native species.		

Table 2-4. Vegetation Decisions

native species (a) are not available, (b) are not economically feasible, (c) cannot achieve ecological objectives as well as nonnative species, and/or (d) cannot compete with already established non-native species.	Non-native forbs and perennial grasses could be used in preference to monocultures of non-native annuals.

Issue: Management Activities in Riparian Areas

Management Actions

Common to the Proposed RMP and Draft RMP Alternatives

- Allow uses and activities in riparian areas consistent with Utah BLM Riparian Management Policy and in compliance with Executive Orders 11990 and 11988.
- Allow no new surface disturbing activities within a specified distance of riparian areas (see specific buffer sizes below), as measured from bank-full width along all perennial streams or streams with perennial reach unless the following criteria can be met:
  - There are no practical alternatives to the surface disturbance; or
  - All long-term impacts could be fully mitigated; or
  - The activity would benefit the riparian area.
- The Utah BLM Riparian Management Policy identifies that Riparian areas will be retained in the public land system unless it can be clearly demonstrated that specific sites are so small or isolated that they cannot be managed in an effective manner by BLM or through agreement with State or Federal agencies or interested conservation groups.
- Coordinate riparian management with interested federal, state, tribal and local governments and private conservation groups, etc.

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
The buffer zone would be 500 feet in the Cedar/Beaver/ Garfield/Antimony RMP area, and 330 feet throughout the remainder of the RFO.	The buffer zone would be 330 feet on each side of the stream.	The buffer zone would be equal to the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater, and would be included for riparian areas.	The buffer zone would be 660 feet on each side of the stream.	The buffer zone would be 660 feet on each side of the stream.

</table>

Cultural Resources

Table 2-5. Cultural Resources Decisions

Desired Outcomes (Goals and Objectives)				
• Preserve and protect significant cultural resources and ensure that they are available for appropriate uses by present and future generations. • Seek to reduce imminent threats from and resolve potential conflicts caused by natural or human-caused deterioration, or potential conflicts with other resource uses. • Identify priority areas for new field inventory, based on their probability for significant resources. • Coordinate with local historic and cultural preservation and interpretation efforts. • Provide opportunities for traditional (American Indian) uses of cultural resources and sites. • Ensure compliance with Native American Graves Protection and Repatriation Act (NAGPRA) and National Historic Preservation Act (NHPA).				
Issue: Management of Cultural Resources				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• Identify and manage traditional cultural properties (TCP) in coordination with American Indian tribes. • Mitigate adverse impacts to cultural resources resulting from authorized surface disturbing activities. • Meet responsibilities under the NHPA as addressed in the State Protocol Agreement between the Utah State Director of BLM and the Utah State Historic Preservation Officer (SHPO) and the Programmatic Agreement among the BLM, the Advisory Council on Historic Preservation, and the National Conference of SHPOs. • Complete cultural resources inventories prior to allowing permitted surface disturbing activities, excluding those areas and circumstances identified in BLM-Manual M-8110.23, Identifying & Evaluating Cultural Resources, and Handbook UT-BLM-H-8110, Guidelines for Identifying Cultural Resources, Section II.C and Appendix 1. • Coordinate Old Spanish Trail management with the National Park Service (NPS) and other agencies under Public Law 107-325. Specifically: – Provide interpretive information at appropriate locations – Retain public lands in federal ownership – Limit OHV use to designated routes. • Protect eligible cultural sites and mitigate impacts.				
Issue: Management of Cultural Resource Sites by Allocation to Use Categories				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Mitigate impacts to cultural resources from permitted	• Allocate and manage cultural resource sites for scientific use, public use, conservation use, traditional use, and experimental use categories described in Manual BLM-M-8110.4, Identifying and Evaluating Cultural Resources.			

Table 2-5. Cultural Resources Decisions

<table>
<tr><td>activities.</td><td colspan="4">• Reevaluate and revise cultural resources site allocations by site or area when circumstances change or when new data becomes available. Consult with the SHPO and Native American tribes as appropriate.
• Mitigation actions would not be necessary on cultural resource sites if both of the following conditions are met and documented:
– BLM and the SHPO have formally agreed the site is not eligible for listing on the National Register of Historic Places (NRHP)
– The site has no value for other cultural uses (as described in BLM-M-8110.4).</td></tr>
<tr><th colspan="5">Issue: Identification of Areas for New Field Inventories</th></tr>
<tr><th colspan="5">Management Actions</th></tr>
<tr><th>Alternative N
(No Action)</th><th>Alternative A</th><th>Proposed RMP</th><th>Alternative C</th><th>Alternative D</th></tr>

</table>

Paleontological Resources

Table 2-6. Paleontological Resources Decisions

Desired Outcomes (Goals and Objectives)
• Protect scientifically significant paleontological resources. • Provide opportunities for scientific, educational, and recreational uses of paleontological resources. • Cooperate with other federal, state, and local agencies in paleontological resources management activities.
Issue: Management of Paleontological Resources
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• Mitigate adverse impacts to vertebrate and significant non-vertebrate paleontological resources resulting from surface disturbing activities. • Support and provide public education and interpretive opportunities for paleontological resources, including agreements with visitor information providers, use of special designations, or interpretive sites. • Issue paleontological resource use permits for scientific study as appropriate. • Prohibit commercial collection of invertebrate and plant fossils without a BLM-issued permit.

Table 2-6. Paleontological Resources Decisions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
No similar action in any of the existing plans.	Require paleontological assessments prior to permitting surface disturbing activities in areas where there is a high potential to affect scientifically significant paleontological resources.	• Require on-the-ground paleontological inventories prior to permitting surface disturbing activities in areas where there is a high potential to affect scientifically significant paleontological resources. • Require paleontological assessments prior to permitting surface disturbing activities in areas where there is a moderate potential to affect scientifically significant paleontological resources.	Require on-the-ground paleontological inventories prior to permitting all surfacing disturbing activities.	
No similar action in any of the existing plans.	Paleontological inventories would not be required.	• Conduct paleontological inventories intermittently as resources allow. • Prioritize paleontological resource inventories based on the potential to affect scientifically significant resources.	• Conduct paleontological inventories on a limited but annual basis. • Prioritize paleontological resource inventories based on the potential to affect scientifically significant resources.	

Table 2-6. Paleontological Resources Decisions

Allow collection of common invertebrate and botanical paleontological resources for personal use.	Allow surface collection (as defined in BLM Manual 8270, *Paleontological Resources Management*) of common invertebrate and botanical paleontological resources for personal (non-commercial) use without permits and if consistent with other management decisions in this RMP. Significant resources of critical scientific and educational value would be protected.	Allow collection of common invertebrate and botanical paleontological resources for personal (non-commercial) use without permits only in specifically designated fossil collecting areas.
No similar action in any of the existing plans.	When appropriate, target fossil localities with significant scientific value for excavation and curation either by the BLM or by a qualified outside academic or curatorial/research facility to protect them from theft, erosion, and/or vandalism. If excavation is not carried out within one field season, periodically monitor to document the integrity of the locality until excavation and curation are completed.	
No similar action in any of the existing plans.	Monitor highly significant (scientific) localities with paleontological resources that are not feasible to excavate, curate, or interpret. Frequency of monitoring for identified localities would be determined by the significance of the resource and the risk of damage by either natural processes or human intrusion.	
No similar action in any of the existing plans.	Develop interpretation for significant localities and sites with displays that foster scientific knowledge of the unique nature of the resource and that create opportunities for public education and access to such resources.	
No similar action in any of the existing plans.	For all permitted actions occurring in paleontologically sensitive areas, include stipulation(s) to cover unanticipated paleontological discoveries during disturbance. This stipulation would mandate work stoppage (or avoidance), notification to the authorized officer, and protection of the material and geological context if any paleontological resources were discovered during disturbance activities. Other stipulations might be appropriate on a case-by-case basis.	

Visual Resources

Table 2-7. Visual Resource Management Decisions

<table>
<tr><th colspan="5">Desired Outcomes (Goals and Objectives)</th></tr>
<tr><td colspan="5">• Manage public lands for their scenic values while providing for overall multiple use and quality of life for local communities and visitors to public lands.
• Manage actions to preserve those scenic vistas that are deemed most important.</td></tr>
<tr><th colspan="5">Issue: Assignment of Visual Resource Management Classes to All Public Lands in the RFO</th></tr>
<tr><th colspan="5">Management Actions</th></tr>
<tr><th colspan="5">Common to the Proposed RMP and Draft RMP Alternatives</th></tr>
<tr><td colspan="5">• Designate WSAs as VRM Class I to maintain an undeveloped landscape and preserve their natural values according to direction in Instruction Memorandum IM-2000-096, Use of Visual Resource Management Class I Designation in Wilderness Study Areas.
• Ensure all activities authorized by the BLM meet the management objectives for the designated VRM class in that particular area.
• To the extent practicable, bring existing visual contrasts into VRM class conformance as the opportunity arises.</td></tr>

(No Action)</th><th>Alternative A</th><th>Proposed RMP</th><th>Alternative C</th><th>Alternative D</th></tr>
<tr><td>Manage the RFO according to the following VRM classes, as indicated on Map 2-1:
• Class I: 0 acres
• Class II: 529,500 acres
• Class III: 569,000 acres
• Class IV: 1,029,500 acres.
In accordance with BLM policy, WSAs would continue to be managed as VRM Class I (446,900 acres).</td><td>Designate the following VRM classes, as indicated on Map 2-2:
• Class I: 446,900 acres
• Class II: 0 acres
• Class III: 392,800 acres
• Class IV: 1,288,300 acres.
WSAs would be designated as VRM Class I (446,900 acres).</td><td>Designate the following VRM classes, as indicated on Map 2-3:
• Class I: 446,900 acres
• Class II: 249,800 acres
• Class III: 393,100 acres
• Class IV: 1,038,200 acres.
WSAs would be designated as VRM Class I (446,900 acres).</td><td>Designate the following VRM classes, as indicated on Map 2-4:
• Class I: 446,900 acres
• Class II: 230,600 acres
• Class III: 509,100 acres
• Class IV: 941,400 acres.
WSAs would be designated as VRM Class I (446,900 acres).</td><td>Designate the following VRM classes, as indicated on Map 2-5:
• Class I: 1,129,600 acres
• Class II: 66,700 acres
• Class III: 355,100 acres
• Class IV: 576,600 acres.
WSAs would be designated as VRM Class I (446,900 acres).</td></tr>
<tr><th colspan="5">Issue: Application of VRM Standards to Existing ROWs</th></tr>
<tr><th colspan="5">Management Actions</th></tr>
<tr><th colspan="5">Common to the Proposed RMP and Draft RMP Alternatives</th></tr>
<tr><td colspan="5">To avoid potential conflicts with the construction, operation, maintenance, and termination of facilities and improvements located on existing ROWs on public land, apply the following:
• Where a ROW grant specifically identifies an area and/or width, the VRM class within the specified area/width would be VRM Class IV.
• Where no width is specified, the VRM class within the interior boundaries of the area disturbed when the facility or improvement was initially constructed would be VRM Class IV.</td></tr>
</table>

Special Status Species

Table 2-8. Special Status Species Decisions

Desired Outcomes (Goals and Objectives)
• Conserve and recover all SSS (including listed species) and the ecosystems on which they depend. • Manage, minimize, and mitigate impacts to plant, fish, and animal species and habitats so that the need to list any of these species as threatened or endangered does not become necessary. • Promote recovery and conservation of special status plant, fish, and animal species, including those listed under the Endangered Species Act (ESA). • Prevent long-term habitat fragmentation through avoidance and/or site-specific reclamation to return areas to productive levels. • Continue to work with United States Fish and Wildlife Service (USFWS) and others to ensure that plans and agreements are updated and implemented as necessary to reflect the latest scientific data. • Where possible, implement the conservation actions identified in the Utah Comprehensive Wildlife Conservation Strategy (Utah Division of Wildlife Resources [UDWR] 2005c), which identifies priority wildlife species and habitats, identifies and assesses threats to their survival, and identifies long-term conservation actions needed, including those on BLM-administered lands.
Issue: Overall Special Status Species Management Guidance
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• For listed species that do not have designated critical habitat, cooperate with the USFWS and other agencies, such as the UDWR, in managing the species and their habitat. • Allow, initiate, or participate in scientific research of listed and sensitive species and their habitats. • Collaborate with the appropriate local, state, and federal agencies to promote public education on species at risk, their importance to the human and biological community, and reasons for protective measures that would be applied to the lands involved. • Implement species-specific conservation measures to avoid or mitigate adverse effects to known populations of listed and non-listed special status plant and animal species on public lands. • Prohibit actions that destroy, adversely modify, or fragment listed threatened or endangered species' habitat. • Maintain the integrity of SSS habitat to provide the quantity, continuity, and quality of habitat necessary to maintain SSS populations. • Conduct habitat improvement treatments for SSS. future consultation would be needed for biological controls in SSS habitat. • Retain habitat for federally listed and candidate species in federal ownership. Exceptions may be considered in exchanges with the State of Utah and others after consultation with and concurrence from the USFWS. • Consider SSS habitat in all wildfire suppression efforts. • Conduct Section 7 consultation with the USFWS if biological treatments as a result of vegetation management actions are proposed in federally listed species habitats. **Recovery Plans and Conservation Agreements**

Table 2-8. Special Status Species Decisions

- Implement the goals and objectives of recovery plans, conservation agreements and strategies, and activity level plans using best available information to recover and conserve species to the point where requirements of the ESA are no longer necessary.
- Work with USFWS and others to ensure that plans and agreements are updated and implemented as necessary to reflect the latest scientific data.
- Implement the specific goals and objectives of recovery plans, conservation agreements and strategies, and approved activity-level plans.

Recovery Actions for Listed Species

- Do not adversely modify or destroy designated critical habitats for federally listed species.
- Provide habitat improvements and other management actions to promote conservation and recovery of listed species.

Reintroduction/Translocation of Special Status Species

- Allow translocations of listed and non-listed SSS to aid in conservation and recovery efforts. Implement necessary habitat manipulations and monitoring in translocation plans and allow identification and manipulation of Utah prairie dog translocation sites to achieve suitable conditions for successful translocations.

Issue: Habitat Mitigation

Management Actions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Decisions for habitat mitigation are not specifically addressed in existing plans.	• Use strategies to avoid or reduce habitat fragmentation when possible, including: – Collocating communication and other facilities – Employing directional drilling for oil and gas – Closing and reclaiming roads – Landscape scale evaluations – Using topographic and vegetative screening to reduce the influence of intrusions. • Mitigate the effects of proposed projects that have the potential to cause long-term or permanent habitat impacts or losses by enhancing, restoring, or creating other habitat within the project's region of influence. Consider protecting the habitat when the habitat type is rare and under severe development pressures. Protection should only be a portion of the mitigation and must contain elements of restoration or enhancement. • Use species-specific buffers and seasonal, temporal, and spatial restrictions to conserve habitat for SSS (Appendix 11 and Appendix 14).			

Issue: Protection of Raptor Habitat

Management Actions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Manage raptors as required in current LUPs.	• Employ "Raptor Best Management Practices" (Appendix 10), using seasonal and spatial buffers, as well as mitigation, to maintain and enhance raptor nesting and foraging habitat, while allowing other resource uses.			

Table 2-8. Special Status Species Decisions

	• Comply with Suggested Practices for Avian Protection on Power Lines: the State of the Art in 2006 (APLIC 2006) and Avian Protection Plan (APP) Guidelines (APLIC and USFWS 2005) for new powerline construction (including upgrades and reconstruction) to prevent electrocution of raptors.			
Issue: Management of OHV Use in Greater Sage-Grouse Habitats				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue to follow current policy for sensitive species.	Limit OHV use to designated routes in sage-grouse leks and nesting habitats.	Limit OHV use to designated routes and/or seasonal closure of designated routes in all Greater sage-grouse habitats, including: breeding (leks), nesting, brood-rearing, and wintering habitats.		
Issue: Special Stipulations for Surface Disturbing Activities Within Greater Sage-Grouse Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Prohibit surface disturbing activities from March 1 through July 15, for protection of species sensitivity during lekking activities. Prohibit surface disturbing activities within sage-grouse brooding habitat from April 1 through June 15 for protection of brooding and nesting activities.	Prohibit surface disturbing activities within one-quarter mile of sage-grouse leks from March 15 through June 1 for protection of species sensitivity during lekking activities. Any surface disturbing activity conducted outside this time frame would not result in an above-ground structure within one-quarter mile of leks from March 15 through June 1. No special stipulation required for surface disturbing activities within sage-grouse brooding habitat.	• Manage oil and gas leasing as open subject to major constraints (NSO) within ½ mile of greater sage-grouse leks. • Allow no surface disturbing or otherwise disruptive activities in greater sage-grouse winter habitat from December 15 through March 14. • Allow no surface disturbing or otherwise disruptive activities within 2 miles of a greater sage-grouse lek from March 15 to July 15 to protect sage-grouse breeding and brood-rearing habitat. See Appendix 11 for exceptions, modifications, or waivers.	• Prohibit surface disturbing activities within 2 miles of sage grouse leks from March 15 through June 1 for protection of species sensitivity during lekking activities. Any surface disturbing activity conducted outside this time frame would not result in an above ground structure within 2 miles of leks from March 15 through June 1. • Prohibit long-term surface disturbing activities within sage-grouse brooding/nesting habitat from April 1 through July 15 for protection of brooding and nesting activities. See Appendix 11 for exceptions, modifications, or waivers.	

Fish and Wildlife

Table 2-9. Fish and Wildlife Decisions

Desired Outcomes (Goals and Objectives)
• Maintain, restore, protect, and enhance habitats to support healthy populations of diverse fish and wildlife species, recognizing crucial habitats as management priorities.
• Manage habitat to prevent additional listings of species under the federal ESA, or the State of Utah's Species of Concern List.
• Manage for unfragmented blocks of habitat that provide for a variety of wildlife and fish species.
• Recognize and support the role of UDWR in managing wildlife and fish populations and regulating hunting and fishing.
• Recognize and support the role of USFWS in managing raptors, migratory birds, and threatened and endangered species.
• Recognize and support the role of the Federal Animal and Plant Health Inspection Service (APHIS) in controlling predators.
Issue: Overall Fish and Wildlife Management Guidance
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• Recognize and coordinate with UDWR on its Management Plans and associated revisions, and (where appropriate) plans of other cooperating agencies. To the extent practicable, implement future plans on a case-by-case basis through applicable regulations.
• Implement BLM wildlife management plans.
• Implement the conservation actions identified in Executive Order 13186, Federal Agency Responsibilities under the Migratory Bird Treaty Act, with particular emphasis on those migratory birds identified as Priority Species in the Utah Avian Conservation Strategy (Parrish et al. 2002).
• Consider the USFWS Birds of Conservation Concern and the Utah Partners in Flight Priority Species to identify and conserve priority nesting habitats for migratory birds.
• Cooperate with UDWR in the management of fisheries, including habitat improvements and treatments.
• Work with UDWR to establish and maintain Blue Ribbon Fisheries, as defined by the Utah Blue Ribbon Fishery Advisory Council.
• Coordinate with UDWR to address population dynamics and habitat conditions for major habitat types that support a wide variety of game and non-game species.
• Use strategies to avoid or reduce habitat fragmentation, such as collocating facilities, employing directional drilling, reclaiming redundant roads, reclaiming roads no longer serving intended purpose, reducing road densities, and using topographic and vegetative screening to reduce influence of intrusions.
• The BLM will approach compensatory mitigation on an "as appropriate" basis where it can be performed onsite, and on a voluntary basis where it is performed off-site, or, in accordance with current guidance.
• Minor adjustments to crucial wildlife habitat boundaries periodically made by the UDWR would be accommodated through plan maintenance.
• Where possible, implement the conservation actions identified in the Utah Comprehensive Wildlife Conservation Strategy (UDWR 2005c), which identifies priority wildlife species and habitats, identifies and assesses threats to their survival, and identifies long-term conservation actions needed, including those on BLM-administered lands.

Table 2-9. Fish and Wildlife Decisions

Issue: Forage Management and Allocations				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Manage big game winter range to maximize browse production, using class of livestock and season of use.	Use prescriptive grazing to favor forage production on crucial big game winter range.	• Use prescriptive grazing to favor forage production for big game crucial winter range. • On suitable allotments, as determined on a case-by-case basis, authorize livestock grazing only on a nonrenewable basis to meet wildlife habitat objectives. These actions would be limited to crucial wildlife habitat where conventional grazing management practices were not allowing attainment of RMP objectives.	• Use prescriptive grazing to favor forage production for big game ranges. • On suitable allotments, as determined on a case-by-case basis, authorize livestock grazing only on a nonrenewable basis to meet wildlife habitat objectives. These actions would be limited to crucial wildlife habitat where conventional grazing management practices were not allowing attainment of RMP objectives.	
Accomplish habitat treatments to meet terrestrial, aquatic, and riparian habitat objectives through the use of prescribed fire, chemical, biological, and mechanical methods.	Accomplish habitat treatments to meet terrestrial, aquatic, and riparian habitat objectives through the use of prescribed and/or wildland fire, chemical, biological, and mechanical methods.		Accomplish habitat treatments to meet terrestrial, aquatic, and riparian habitat objectives through the use of prescribed and/or wildland fire and biological methods.	
Issue: Management of Henry Mountain Bison and Mule Deer				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Provide no special management for Henry Mountain bison or mule deer.		Develop a Habitat Management Plan (HMP) for bison, mule deer, and other	• Designate an ACEC in the Henry Mountains (288,200 acres) to recognize bison, mule deer, and scenic values.	

Table 2-9. Fish and Wildlife Decisions

		big game species within the Henry Mountain area in consultation with UDWR. (The HMP would address management objectives with respect to size of herds (numbers of animals), desired ratio of male to female animals, and the reauthorization of voluntarily relinquished grazing preference and reallocation of forage on specific grazing allotments. The HMP would also address needed improvements for range conditions, including proposed habitat improvement projects for both livestock and big game species to mitigate potential conflicts during seasons of use and the strategies required for herd adjustments during critical droughts.)	• Manage bison habitat in cooperation with UDWR. • Allow manipulation of habitat to benefit wildlife. • Allow range improvements outside of wilderness characteristics areas (Alternative D only) that benefit wildlife (water developments, fencing riparian areas, etc.). • Develop an HMP for bison and mule deer within the ACEC. • Address voluntary relinquishments of grazing preference and reauthorization of AUMs as provided for in Instruction Memorandum IM-2007-67, Relinquishment of Grazing Preference on BLM-Administered Lands. • See Table 2-21 (ACEC Decisions) for other management prescriptions.
Issue: Management of Desert Bighorn Sheep Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Comply with the Henry Mountains Desert Bighorn HMP (1990).	Prohibit change in the kind of livestock from cattle to domestic sheep in those allotments with bighorn sheep habitat identified in the *Desert Bighorn Sheep HMP*.		Prohibit change in kind of livestock from cattle to domestic sheep within all identified bighorn sheep habitat.	
Issue: Management of OHV Use in Deer and Elk Habitats				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue OHV management as outlined in current LUPs.	Require no specific OHV restrictions within crucial deer	• Limit OHV use to designated routes in	• OHV use in 509,000 acres of deer and elk	• OHV use in 393,000 acres of deer and elk

Table 2-9. Fish and Wildlife Decisions

	and elk habitat.	deer and elk crucial winter habitat (806,700 acres), except for Glenwood and Aurora, Managed Open Areas. • Close 4,500 acres of deer and elk crucial winter range to OHV use. • Consider seasonal closure of designated routes on a case-by-case basis. (Maps 3-6 and 3-7)	crucial winter range would be limited to designated routes. • 142,000 acres of deer and elk crucial winter range would be closed to OHV use. (Maps 3-6 and 3-7)	crucial winter range would be limited to designated routes. • 258,000 acres of deer and elk crucial winter range would be closed to OHV use. (Maps 3-6 and 3-7)
Issue: Management of OHV Use in Crucial Bison Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Close crucial bison habitat to OHV use from December 20–March 20 at Swap Mesa and Cave Flat.	Limit OHV use to designated routes in crucial bison habitat (251,000 acres).	• OHV use in 257,600 acres of crucial bison habitat would be limited to designated routes. • 1,000 acres of crucial bison habitat would be closed to OHV use. • Consider seasonal closure of designated routes on a case-by-case basis.	• OHV use in 62,000 acres of crucial bison habitat would be limited to designated routes. • 189,000 acres of crucial bison habitat would be closed to OHV use. (Map 3-5)	• OHV use in 44,000 acres of crucial bison habitat would be limited to designated routes. • 207,000 acres of crucial bison habitat would be closed to OHV use. (Map 3-5)
Issue: Management of OHV Use for Game Retrieval				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Manage OHV use for game retrieval consistent with OHV area and route designations.				

Table 2-9. Fish and Wildlife Decisions

Issue: Seasonal Stipulation for Surface Disturbing Activities in Bison Habitats				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Restrict oil and gas exploration and leasing activities in crucial bison habitats (Map 3-5) from December 1 through April 15 for protection of winter habitats and species sensitivity during calving season.	No special stipulation required; however, mitigation may be required for surface disturbing activities in crucial bison habitats (Map 3-5) from November 1 through May 15.	Restrict surface disturbing activities in crucial bison habitats (Map 3-5) from November 1 through May 15 for protection of winter habitats and species sensitivity during calving season. See Appendix 11 for exceptions, modifications, or waivers.		
Issue: Seasonal Stipulation for Surface Disturbing Activities in Crucial Mule Deer and Elk Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Restrict oil and gas exploration and development in crucial and high-value mule deer and elk habitats (Maps 3-6 and 3-7) from December 15 through May 15 for protection of winter habitats and species sensitivity during fawning season.	No special stipulation required; however, mitigation may be required for surface disturbing activities in crucial and high-value mule deer and elk habitats (Maps 3-6 and 3-7) from December 15 through April 15.	Restrict surface disturbing activities in crucial mule deer and elk habitats (Maps 3-6 and 3-7) from December 15 through April 15 for protection of winter habitats, unless the action is carried out to enhance habitats for mule deer, elk, and/or other wildlife. See Appendix 11 for exceptions, modifications, or waivers.	Restrict surface disturbing activities in crucial and high-value mule deer and elk habitats (Maps 3-6 and 3-7) from December 15 through April 15 for protection of winter habitats. Grant no exceptions.	
Issue: Seasonal Stipulation for Surface Disturbing Activities in Crucial Desert Bighorn Sheep Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
No special stipulation required.	No special stipulation required; however, mitigation may be required for surface disturbing activities in crucial	Prohibit surface disturbing activities in crucial Desert bighorn sheep habitat (Map 3-5) from April 15 through June 15 for protection of species sensitivity during lambing season. See Appendix 11 for exceptions, modifications, and waivers.		

Table 2-9. Fish and Wildlife Decisions

	Desert bighorn sheep habitat (Map 3-5) from April 15 through June 15.			
Issue: Special Stipulations for Surface Disturbing Activities in Crucial Pronghorn Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Prohibit oil and gas exploration and development activities in crucial pronghorn habitat (Map 3-5) from December 1 through April 30 for protection of species sensitivity during fawning season.	No special stipulation required; however, mitigation may be required for surface disturbing activities in crucial pronghorn habitat (Map 3-5) from May 15 through June 15.	Restrict surface disturbing activities in crucial pronghorn habitat (Map 3-5) from May 15 through June 15 for protection of species sensitivity during fawning season. Issue: Special Stipulation for Surface Disturbing Activities in Riparian and Wetland Habitats				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Prohibit surface disturbing activities within 500 feet of live water.	Prohibit surface disturbing activities within the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater, of streams with intermittent or perennial reaches, resulting in NSO in this area, for protection of habitat for riparian-obligate species.		Prohibit surface disturbing activities within 660 feet of streams with intermittent or perennial reaches, resulting in NSO in this area, for protection of habitat for riparian-obligate species.	
Issue: Reintroduction, Transplantation, Augmentation, and Reestablishment of Wildlife and Fish Species				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Cooperate with UDWR and USFWS in reintroducing wildlife species into historic ranges as determined through NEPA analysis. • Consider wildlife	• Analyze UDWR and USFWS proposals to introduce, augment, transplant, and reestablish wildlife species through NEPA evaluation. • Allow introduction, translocation, transplantation, augmentation, and reestablishment of both native and naturalized fish and wildlife species in cooperation and collaboration with UDWR.		• Analyze UDWR and USFWS proposals to introduce, augment, transplant, and reestablish wildlife species through NEPA evaluation. • Allow introductions, translocation, transplantation, augmentation, and reestablishment of native species only in cooperation and collaboration with UDWR.	

Table 2-9. Fish and Wildlife Decisions

transplants of big game species and fish.				
Issue: Management of Raptor Habitat				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Manage raptors as required in current LUPs.	Implement the following direction: "Raptor management will be guided by the use of "Best Management Practices for Raptors and Their Associated Habitats in Utah" (BLM 2006) (Appendix 10), utilizing seasonal and spatial buffers, as well as mitigation, to maintain and enhance raptor nesting and foraging habitat, while allowing other resource uses."			

Wild Horses and Burros

Table 2-10. Wild Horses and Burros Decisions

Desired Outcomes (Goals and Objectives)
• Manage wild burros at appropriate levels in viable, vigorous, and stable populations to ensure a natural ecological balance among wild burro populations, wildlife, livestock, vegetation resources, and other resource values. • Manage for genetic diversity of wild burros within the Canyonlands HMA. • Maintain, enhance, and perpetuate the viable herd's distinguishing characteristics that were typical at the time of the passage of the Wild Free-Roaming Horse and Burro Act or that are identified in population management plans.
Issue: Overall Wild Horses and Burros Management Guidance
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
Manage wild burro populations for appropriate age and sex ratios, genetic viability, and adoptability, as well as maintaining AML on the established HMA (Map 3-8). Allow wild burro research, as long as other wild horse and burro program goals are met. Wild burro herd research data that may be collected include, but are not limited to, data to determine population size and characteristics, assess herd health, determine herd history and genetic profile (blood and hair sampling, Instruction Memorandum IM # 2002-095 *Gather Policy and Selective Removal Criteria for Wild Horses Program Area: Wild Horse and Burro Program*), and conduct immuno-contraceptive research and monitor results as appropriate. Other data that could be useful in population management would include general characteristics such as age ratios, sex ratios, and color, as well as health characteristics such as pregnancy rates, parasite loading, and the general physical condition of the burros. In addition, genetic sampling would determine the genetic health of the herd. BLM will coordinate with the NPS to address burro trespass issues.

Table 2-10. Wild Horses and Burros Decisions

Issue: Management of the Canyonlands Herd Management Area				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Manage Canyonlands HMA as a wild burro HMA. No AML has been set in existing planning documents (Map 3-8). • Allocate 100 AUMs for wild burros. • Maintain the AML of the Canyonlands HMA at levels to maintain genetic viability.		Manage Canyonlands HMA as a wild burro HMA with an AML of 60–100 (Map 3-8). • Allocate 600 AUMs for wild burros to meet an AML upper limit of 100. • Maintain the AML of the Canyonlands HMA at levels to maintain genetic viability. • Allow introductions of wild burros from other herd areas to maintain genetic viability, given the burros being introduced have characteristics similar to the burros in the Canyonlands HMA.	Manage Canyonlands HMA as a wild burro HMA with an AML of 120–200 (Map 3-8). • Allocate 1,200 AUMs for wild burros to meet an AML upper limit of 200. • Maintain the AML of the Canyonlands HMA at levels to maintain genetic viability.	

Fire and Fuels Management

Table 2-11. Fire and Fuels Management Decisions

Desired Outcomes (Goals and Objectives)				
• Manage fire and fuels to protect life, firefighter safety, property, and critical resource values. • Reduce the threat of wildfire in the Wildland Urban Interface (WUI). • Manage fire and fuels, where appropriate, to restore natural systems to their desired future condition, considering the interrelated social and economic components. • Manage wildland fires to minimize cost considering firefighter and public safety, benefits, and values to be protected, consistent with resource objectives.				
Issue: Fire Management in the Wildland Urban Interface				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• Employ WUI Fire and Fuels Management according to national policy to meet vegetation treatment goals. • Work with partners in the WUI in prescribed fires, hazardous fuels reduction, prevention and education, and technical assistance. • Apply Resource Protection Measures for fire management practices to protect natural or cultural resource values as described in Appendix 19 (obtained from the Utah Land Use Plan Amendment for Fire and Fuels Management Finding of No Significant Impact and Decision Record, Table 2.3).				
Issue: Appropriate Management Response, Hazardous Fuels Reduction, and Wildland Fire Use				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Manage fire using a full suite of tools that allows for the graduated movement to a more ecologically sustainable condition and reduction of hazardous fuels.	• Implement appropriate management response (AMR) according to General Risk Categories (GRC), as contained in Appendix 6. The GRCs contain criteria for managing dynamic vegetation communities. Wildland fire use would not be appropriate in the following areas: – Administrative sites – Developed recreation sites – Communication sites – Oil and gas facilities – Mining facilities – Above-ground utility corridors – High-use travel corridors – Crucial wildlife habitats where fire is unwanted – GRC A, such as desert scrub communities. • Prioritize other fire management activities as directed and prioritized in the GRCs. • Adhere to specific fire suppression directions within Potential ACECs as noted in Table 2-21, for protection of identified relevant and important values from irreparable damage.			

Table 2-11. Fire and Fuels Management Decisions

	• Give specific considerations when implementing suppression activities to SSS habitats and cultural resource sites.			
Issue: Hazardous Fuels Reduction				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Reduce hazardous fuels to restore ecosystems; protect human, natural, and cultural resources; and reduce the threat of wildfire to communities.	Manage fire and fuels through treatments conducted on up to 1,472,000 acres over the life of the plan. Use the full range of treatment types (e.g., prescribed and wildland fire use, mechanical, chemical, biological, and cultural treatments). An annual average of 73,600 acres would need to receive treatment to reach the total treatment acreage listed (Table 2-11a). Actual annual treatment acreage would vary depending on conditions, staffing, etc. These acreage figures include all vegetation and fire fuels treatments (Table 2-4).		Manage fire and fuels through treatments conducted on up to 520,000 acres over the life of the plan. Use prescribed fire, intensively treating areas to create properly functioning ecosystems and desired natural communities. The type of treatment would vary depending on case-by-case environmental conditions. Human management would be applied to protect life and property and to ensure ecosystem function in areas currently at risk of losing key ecosystem components following wildfire. (An annual average of 26,000 acres would need to receive treatment to reach the total treatment acreage listed [Table 2-11a]. Actual annual treatment acreage would vary depending on conditions, staffing, etc. These acreage figures include all vegetation and fire fuels treatment [Table 2-4]).	
Issue: Prevention and Mitigation of Wildland Fire				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Prevent human-caused fires through coordination with partners and affected groups and individuals. Use a full range of prevention and mitigation activities.	• Prevent human-caused fires through coordination with partners and affected groups and individuals. Use a full range of prevention and mitigation activities. • Use prioritization criteria contained in the GRCs (Appendix 6).			

Table 2-11. Fire and Fuels Management Decisions

Issue: Emergency Stabilization and Rehabilitation (ESR)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Undertake ESR efforts to protect and sustain ecosystems, public health, and safety, and to help communities protect infrastructure.		Undertake ESR efforts to protect and sustain ecosystems, public health, and safety, and to help communities protect infrastructure. Prioritize implementation of post-fire emergency stabilization and rehabilitation activities considering the following criteria: • Areas that could pose a threat to life and property • Areas with potential for invasive species invasion, significant ecosystem alteration (e.g., Condition Class 3 areas), and soil stabilization		

Table 2-11a. Estimated Treatment Acreages

Estimated Treatment Acreages		
20 Year Treatment Acreage—Alternatives A and Proposed RMP	**20 Year Treatment Acreage—Alternatives C and D**	**Vegetation Class**
0	0	Other (Non-Vegetated)
58,634	7,329	Mixed Conifer
5,786	1,927	Aspen
171,140	34,228	Ponderosa

Non-WSA Lands with Wilderness Characteristics

Table 2-12. Non-WSA Lands with Wilderness Characteristics Decisions

Desired Outcomes (Goals and Objectives)				
• Protect, preserve, and maintain the wilderness characteristics (appearance of naturalness and outstanding opportunities for solitude or primitive and unconfined recreation) of areas determined to be practicable to manage for the protection of wilderness characteristics by BLM inventory maintenance as appropriate. • Manage primitive and backcountry landscapes to preserve their undeveloped character and scenic quality, and to provide opportunities for primitive and unconfined recreational activities and experiences of solitude, as appropriate.				
Issue: Management of Non-WSA Lands with Wilderness Characteristics				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
No special direction for managing the non-WSA lands with wilderness characteristics is included in the existing LUPs.	Provide no special management direction for protecting the non-WSA lands with wilderness characteristics.	Manage the following 12 non-WSA lands with wilderness characteristic areas (78,600 acres) specifically to maintain their wilderness characteristics: (1) Dirty Devil/French Spring (6,100 acres) (2) Dogwater Creek (3,100 acres) (3) Horseshoe Canyon South (12,200 acres) (4) Jones Bench (2,600 acres) (5) Labyrinth Canyon (2,800 acres) (6) Little Rockies (9,500 acres) (7) Mount Ellen-Blue Hill (3,900 acres) (8) Mount Pennell (4,700 acres) (9) Notom Bench	Same as Alternative A.	Protect the 29 areas (682,600 acres) of non-WSA lands with wilderness characteristics (identified in Chapter 3 and on Map 3-9) through the following land allocations and prescriptions: • Designate as VRM Class I • Manage for primitive and semi-primitive non-motorized recreation • Close to motorized use • Retain land in public ownership • Designate as an Avoidance Area for ROWs • Propose for withdrawal from mineral entry • Close to oil and gas leasing • Close to mineral

		(8,200 acres) (10) Ragged Mountain (7,900 acres) (11) Red Desert (8,900 acres) (12) Wild Horse Mesa (8,700 acres). Protect the 12 areas (78,600 acres) of non-WSA lands with wilderness characteristics through the following land allocations and prescriptions: • Designate as Visual Resource Management (VRM) Class II • Limit motorized use to designated routes • Retain lands in public ownership • Designate as an Avoidance Area for rights-of-way (ROW) • Designate leasing category as no surface occupancy (NSO), no exceptions, waivers, or modifications • Close to mineral material sales • Designate as unavailable for further consideration for coal leasing • Continue maintenance and use of existing facilities • Prohibit private or commercial woodland harvest or seed collection • Healthy Lands Initiative projects could be		material sales • Designate as unavailable for further consideration for coal leasing.

		considered where they improve the overall goals and objectives for managing the wilderness characteristics of these areas • Consider no coal leasing proposals in the 12 (78,600 acres) identified non-WSA lands with wilderness characteristics.		

2.6.2 Resource Uses

Forestry and Woodland Products

Table 2-13. Forestry and Woodland Products Decisions

<table>
<tr><th colspan="5">Desired Outcomes (Goals and Objectives)</th></tr>
<tr><td colspan="5">• Provide forest and woodland products (including fuelwood, timber, posts, pinyon nuts, and Christmas trees) on a sustainable basis.
• Reduce pinyon-juniper encroachment through woodland product use where increased density threatens other resource values.
• Provide opportunities for seed and live plant collecting where and when ecologically feasible.
• Emphasize forest and woodland health.</td></tr>
<tr><th colspan="5">Issue: Overall Management of Forests and Woodlands</th></tr>
<tr><th colspan="5">Management Actions</th></tr>
<tr><th colspan="5">Common to the Proposed RMP and Draft RMP Alternatives</th></tr>
<tr><td colspan="5">• Allow use of forest and woodland species to achieve desired conditions.
• Reforest sites after disturbances.
• Manage forests and woodlands to meet objectives of the Healthy Forest Restoration Act of 2003, including:
– Develop a Forest and Woodlands Management Plan
– Give priority to restoration of destroyed or degraded woodland ecosystems
– Employ commercial uses to improve forest and woodland ecosystem health
– Emphasize partnerships among internal programs and outside agencies for forest and woodland management
– Increase monitoring of forest and woodland conditions
– Emphasize public education on forest and woodland health, fire danger, and resource uses
– Identify, maintain, and restore old-growth forests.</td></tr>
<tr><th colspan="5">Issue: Areas Open to Timber Harvest</th></tr>
<tr><th colspan="5">Management Actions</th></tr>

Exceptions for traditional Native American use may be considered. • Consider designating specific seed collecting areas for resource benefits.	wilderness characteristics (682,600 acres), and suitable WSR corridors. Exceptions for traditional Native American use may be considered. • Consider designating specific seed collecting areas for resource benefits.

Livestock Grazing

Table 2-14. Livestock Grazing Decisions

Desired Outcomes (Goals and Objectives)				
• Provide for the orderly use, improvement, and development of the range for livestock grazing. • Provide for livestock grazing while maintaining rangelands in properly functioning condition. • Maintain healthy, sustainable rangeland ecosystems and restore degraded rangelands to meet Utah's Standards for Rangeland Health and to provide a wide range of public values, such as wildlife habitat, livestock forage, recreation opportunities, clean water, and functional watersheds. • Integrate livestock use and associated management practices with other multiple use needs and objectives to maintain, protect, and improve rangeland health.				
Issue: General Grazing Management				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• Monitor and evaluate grazing allotments to maintain or improve rangeland productivity. • Adjust permit terms and conditions (e.g., permitted use, amount of use, season of use, and kind and class of livestock) when grazing permits are renewed, transferred, or as otherwise deemed necessary by site-specific evaluation of monitoring data and environmental analysis. • Use livestock grazing to enhance ecosystem health or mitigate resource problems (e.g., noxious/invasive weed control and hazardous fuel reduction) where supported by site-specific environmental analysis. • During periods of drought, adjust livestock numbers annually based on estimates of the available forage. • Exclude livestock grazing from small areas (such as springs) within allotments that cannot meet Rangeland Health Standards with livestock grazing. • Site-specific management actions that protect riparian areas would be addressed at the project level. • Handle on a case-by-case basis voluntary relinquishment of grazing permits and preference, in whole or in part, by a permittee in writing to the BLM. The BLM would not recognize as valid, relinquishments that are conditional on specific BLM actions, and BLM would not be bound by them. Relinquished permits and the associated preference would remain available for application by qualified applicants after BLM considers whether such action would meet Rangeland Health Standards and would be compatible with achieving LUP goals and objectives. Prior to re-issuance of the relinquished permit, the terms and conditions may be modified to meet RMP goals and objectives and/or site-specific resource objectives. However, upon relinquishment, BLM may determine through a site-specific evaluation and associated environmental analysis that the public lands involved would be better used for other purposes. Grazing may then be discontinued on the allotment through an amendment to the RMP. Any decision issued concerning discontinuance of livestock grazing would not be permanent and may be reconsidered and changed through future LUP amendments and updates.				
Issue: Forage Allocations				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue to permit livestock use on those allotments	Permit livestock use on those allotments shown on	Permit livestock use on those allotments shown on Map 2-7 and in Appendix 7 (Table A7-3).		

Table 2-14. Livestock Grazing Decisions

shown on Map 2-7 and in Appendix 7 (Table A7-1). • Acres available for grazing: 1,989,048 • Acres unavailable for grazing: 138,952 • Available AUMs: 146,202	Map 2-6 and in Appendix 7 (Table A7-2). Fourteen allotments comprising 36,950 acres previously unavailable to livestock grazing would again be available to livestock grazing. • Acres available for grazing: 2,025,998 • Acres unavailable for grazing: 102,002 • Available AUMs: 147,281	• Acres available for grazing: 1,989,048 • Acres unavailable for grazing: 138,952 • Available AUMs: 146,202

Issue: Grazing Allotment Boundaries

Management Actions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
• Continue to manage Long Hollow, Terza Flat, Deleeuw, and Loa Winter allotments as separate allotments. • Continue to manage Flat Top, King Sheep, and Bicknell Winter allotments as separate allotments. • Manage Cedar Peak, Hare Lake, Smooth Knoll, and Bicknell Spring allotments as separate allotments. • Manage Cyclone and Cyclone Co-Op allotments as separate allotments.	Authorize allotment boundary changes, including combining and splitting allotments, on a case-by-case basis after environmental analysis. Provide for the following allotment combinations: • Combine Long Hollow, Terza Flat, and Deleeuw allotments with the Loa Winter Allotment. • Combine Flat Top and King Sheep allotments with the Bicknell Winter Allotment. • Combine Cedar Peak, Hare Lake, and Smooth Knoll allotments with the Bicknell Spring Allotment. • Combine the Cyclone Allotment with the Cyclone Co-Op Allotment.			

Table 2-14. Livestock Grazing Decisions

Issue: Guidelines and Criteria for Adjusting Allotment-Specific Grazing Management Practices				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Existing LUPs do not specifically address this issue.	**Conversion in Kind of Livestock** Authorize conversion in kind of livestock on a case-by-case basis when justified through environmental analysis. Permittees may be required to provide needed range improvements to support the conversion. A conversion may be justified when it meets the following criteria: • Monitoring studies or other acceptable data support the conversion. • Environmental conditions (e.g., vegetation types, topographic features, and water availability) can accommodate the conversion. • Change in kind of livestock poses no threat to other resources. • A trial change proves acceptable. **Adjusting Livestock Season of Use** Consider adjustments to season of use when resource conditions indicate a change is needed. Conduct appropriate environmental analysis prior to any changes. Resource conditions include: • Physiological requirements (reproduction and maintenance) of desired plant species are not being met. • Range conditions are declining because of season of use. • Conflicts with other resources or uses are identified. Consider the following actions if livestock grazing is contributing to declining range conditions: • Shorten the grazing period • Temporarily suspend use • Implement or change grazing system • Authorize non-use until conditions improve. Authorize permittee requests for changes to livestock season of use when the following conditions are met: • Physiological requirements (e.g., reproduction and maintenance) of desired plants can be met. • On community allotments, all permittees in that allotment agree to the change. • Requested changes do not conflict with other established land uses. • A trial of the change proves acceptable. • Permittees may be required to provide needed range improvements to support changing the season of use. **Adjusting Permitted Use**			

Table 2-14. Livestock Grazing Decisions

<table>
<tr><td></td><td colspan="4">Consider changes to permitted use if:
• Change is supported by monitoring data, field observations, ecological site inventory, or other acceptable data.
• Conflicts with other uses are identified.
• There is a change in public land ownership (increase or decrease).
• Protection of other resources is required.
• Changes are required by 43 CFR 4180 (Rangeland Health regulations).</td></tr>
<tr><td colspan="5">Issue: Administrative Access for Grazing Management</td></tr>
<tr><td colspan="5">Management Actions</td></tr>
<tr><td colspan="5">Common to the Proposed RMP and Draft RMP Alternatives</td></tr>
<tr><td colspan="5">• Continue to allow motorized access to range improvements for allotment management purposes.
• Allow access within WSAs according to IMP.</td></tr>
<tr><td colspan="5">Issue: Managing Domestic Sheep/Wildlife Conflicts</td></tr>

<tr><td>Permit domestic sheep grazing in bighorn sheep habitat while following the Guidelines for Domestic Sheep and Goat Management in Native Wild Sheep Habitats.</td><td>Permit domestic sheep grazing in bighorn sheep habitat while following the Guidelines for Domestic Sheep and Goat Management in Native Wild Sheep Habitats.</td><td>Permit no domestic sheep and goat grazing east of Capitol Reef National Park, subject to existing livestock grazing permits.</td><td colspan="2">Permit no domestic sheep and goat grazing in bighorn sheep habitat throughout the lands managed by the RFO, subject to existing livestock grazing permits.</td></tr>
</table>

Recreation

Table 2-15. Recreation Decisions

Desired Outcomes (Goals and Objectives)
• Provide recreational opportunities in a variety of physical, social, and administrative settings, from primitive to near-urban, that allow visitors to have desired recreational experiences and enjoy the resulting benefits. • Provide opportunities for recreational experiences unique to the lands managed by the RFO, consistent with resource capabilities and mandated resource requirements; provide for visitor education and interpretation of the recreational opportunities within the RFO. • Work with local communities to foster recreation and tourism. • Provide for public health, education, and safety through interpretation, facility development, and visitor management. • Maintain important recreational values and sites in federal ownership to ensure a continued diversity of recreation settings, activities, and opportunities.
Issue: Overall Recreation Guidance
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
Implement the Utah BLM Standards for Rangeland Health and Guidelines for Recreation Management, as follows: • Recognize that various levels of regulations and limits may be necessary, but that restrictions and limitations on public uses should be as minimized gas possible without compromising the primary goal. • Use an on-the-ground presence as a tool to protect public lands. • Use enhanced off-site interpretation, education, and information as a tool to protect public lands. • Where long-term damage by recreational usage is observed or anticipated, limit or control activities through special management tools such as designated campsites, permits, area closures, and limitations on numbers of users and duration of usage. • Revise recreation management plans and RMPs when they prove to be either overly restrictive or inadequate to protect public land health. • Coordinate with other federal and state agencies, county and local governments, and tribal nations in recreation planning and managing traffic, search and rescues operations, trash control and removal, and public safety. • Consider and implement where appropriate, management methods to protect resources while maintaining the quality of the experience of various users. Limitations could include numbers, types, timing, and duration of usage. • Encourage the location of public land recreational activities near population centers and highway corridors by the placement of appropriate visitor use infrastructure. Provide restrooms and other facilities adequate for anticipated uses at designated campgrounds, trailheads, and other areas where recreational users concentrate. • Allow non-commercial dispersed camping without permit, throughout the RFO administered lands, unless directed by other management prescriptions. • Allow no rock climbing within 300 feet of cultural sites or within one-quarter mile of raptor nests during nesting seasons. • Allow no camping within one-half mile of any Mexican spotted owl protected activity center (PAC). • BLM Back Country Byways may be designated in the future as deemed appropriate with site-specific environmental analysis.

Table 2-15. Recreation Decisions

- National Recreation Trails may be designated in the future as deemed appropriate with site-specific environmental analysis.
- Encourage "Leave No Trace" and "Tread Lightly" camping and travel techniques.
- Site-specific management actions that protect riparian areas would be addressed at the project level.

Issue: Management of Extensive Recreation Management Areas (ERMA)

Management Actions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Continue managing recreation as directed in current LUPs.	• Identify portions of the decision area not delineated as a SRMA as an ERMA. ERMAs would receive only custodial management (which addresses only activity opportunities) of visitor health and safety, user conflict, and resource protection issues, with no activity-level planning. Therefore, actions within ERMAs would generally be implemented directly from LUP decisions. • Manage the ERMAs to provide a variety of recreational opportunities, including primitive, semi-primitive non-motorized, semi-primitive motorized, roaded natural, and rural. Provide outdoor settings ranging from areas with a high-to-moderate opportunity for solitude and closeness to nature, where visitors should be prepared for a high level of self reliance, challenge, and risk; to areas where visitors have the convenience of facilities and a higher interaction with other users. • Consider limiting recreational access, season of use, and numbers of users, if needed, to protect other resources. • Provide facilities based on needs for resource protection and user demand. Consider site-specific development on a case-by-case basis, ranging from minimal, rustic facilities to larger developments that would require major site modifications. • Manage public lands in the Fiddler Butte, Labyrinth Canyon, Blue Hills, and Little Rockies areas in a primitive, naturally appearing setting for a high probability of experiencing solitude, freedom, closeness to nature, self reliance, challenge, and risk. Interaction and evidence of other users would be low. (In some alternatives, these areas are part of SRMAs.) Achieve this by: – Preserving resources while providing for a sustainable recreational opportunity – Managing access and travel primarily as non-motorized, with motorized travel limited to designated routes (access for people with disabilities would be difficult) – Providing minimum improvements needed for site protection – Providing no on-site interpretative facilities. • Manage public lands adjacent to other federal and state lands to complement the recreational experience on the adjoining lands. • Designate sites and areas appropriate for large group events and camping, including: – Starr Spring campground – McMillan Spring campground – Sandy Creek Overlook (except in Alternative D) – Apple Brush Flat near McMillan Spring road junction – Turkey Haven			

Table 2-15. Recreation Decisions

<table>
<tr><td></td><td colspan="4">– Two sites along Sulphur Creek
– Others as necessary to meet recreation demand and protect resources
• Provide signs, trails, trailhead parking, and staging areas to facilitate the use and enjoyment of the ERMA and to protect visitor health, safety, and resources.
• Maintain and/or improve the Paiute, Great Western, and other motorized trail systems.
• Designate, maintain, and improve a non-motorized trail system.</td></tr>
<tr><th colspan="5">Issue: Establishment and Management of Special Recreation Management Areas (SRMA)</th></tr>
<tr><th colspan="5">Management Actions</th></tr>
<tr><th>Alternative N
(No Action)</th><th>Alternative A</th><th>Proposed RMP</th><th>Alternative C</th><th>Alternative D</th></tr>
<tr><td>Current LUPs identify one SRMA.</td><td colspan="4">• Establish and manage SRMAs, as identified below.
• Manage recreation activities and developments in the SRMA to support SRMA goals and objectives.
• Establish recreation management zones (RMZ) to address specific recreation uses, user types, and site-specific prescriptions during activity planning for each SRMA, except for the Factory Butte SRMA.
• Develop recreation facilities in response to resource management needs appropriate to the intent of the SRMA.</td></tr>

Table 2-15. Recreation Decisions

Issue: Management of Recreational Opportunities in the E. Fork Sevier River (Including Otter Creek Reservoir)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue managing the area as a part of the ERMA in cooperation with the Utah Division of Parks and Recreation (Otter Creek State Park).	**Otter Creek Reservoir SRMA** Establish the 3,200 acres of public land adjacent to Otter Creek Reservoir as an SRMA (Map 2-8). • Manage the SRMA to provide a roaded natural experience, providing users the opportunity to interact with each other in developed sites while providing some chance of privacy. • Provide a moderate level of access for people with disabilities. • Provide some facilities for user comfort. Allow site modifications if needed. • Provide simple way-side interpretive exhibits.	• Manage the area as a part of the ERMA in cooperation with the Utah Division of Parks and Recreation. • If warranted by demand, enhance and expand recreation opportunities and facilities such as campgrounds, water, restrooms, and other recreation, picnic, and trailhead facilities.	Manage the area as a part of the ERMA in cooperation with the Utah Division of Parks and Recreation.	**East Fork of the Sevier River SRMA** Establish the East Fork of the Sevier River SRMA (59,500 acres). • Manage lands around Otter Creek Reservoir for dispersed recreational uses in cooperation with the Utah Division of Park and Recreation. • Manage non-WSA lands with wilderness characteristics in and around Kingston Canyon for primitive recreation opportunities. • Manage remaining lands for a roaded natural experience, providing users the opportunity to interact with each other in developed sites while providing some chance of privacy. • Manage the East Fork of the Sevier River in cooperation with the UDWR to enhance the blue ribbon fishing opportunities

Table 2-15. Recreation Decisions

				• Enhance, expand, and market recreation opportunities and facilities such as the Paiute ATV Trail, campgrounds, water, restrooms, and other recreation, picnic, and trailhead facilities as a regional destination location.
Continue to manage the area as open to OHV use.	• Limit OHV use in the SRMA to designated routes and trails east of the reservoir. • Provide an OHV open area west of the reservoir.	Limit OHVs to designated routes, according to the area designations shown in Table 2-16.		Close non-WSA lands with wilderness characteristics to OHV use. Elsewhere in the SRMA, limit vehicles to designated routes. Allow permitted access, where needed, to range developments and mining claims as identified in the activity plan.
Not applicable.	Complete an SRMA activity plan within five years of RMP Record of Decision (ROD).	Not applicable.	Not applicable.	Complete an SRMA activity plan within 5 years of RMP ROD.
Issue: Management of Recreational Opportunities in the Factory Butte Area				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue managing the Factory Butte area as part of the ERMA.	**Factory Butte SRMA** Identify 199,700 acres of public land as the Factory Butte SRMA (Map 2-8) to provide a motorized recreational experience that involves a high degree of self-reliance, challenge, and risk in a natural setting. • Allow moderate to extensive landscape	**Factory Butte SRMA** Identify 24,400 acres of public land as the Factory Butte SRMA (Appendix 18) to provide a motorized recreational experience that involves a high degree of self-reliance, challenge, and risk in a natural setting. • Allow moderate to extensive landscape	Manage recreation values in the Factory Butte area as part of the ERMA in concert with the Badlands ACEC designation. • Develop no facilities to support recreation activities unless needed to meet ACEC objectives.	**San Rafael Swell SRMA** Identify 127,100 acres of public land in the Factory Butte area as part of the San Rafael Swell SRMA (Map 2-11) for primitive and semi-primitive recreational opportunities. Manage in coordination with the Price FO. • Preserve or retain the

Table 2-15. Recreation Decisions

	Canyon WSA, Happy Canyon—French Springs WSA, and the Beaver Wash ACEC.) • Manage SRMA consistent with prescriptions identified in the Beaver Wash ACEC and direction provided in the IMP for WSAs. • Manage SRMA for a high probability of experiencing solitude, closeness to nature, self-reliance, challenge, and risk in an unmodified and natural appearing environment with very low interaction or evidence of other users. • Provide opportunities for primitive and semi-primitive, non-motorized recreation within the Dirty Devil River corridor, its tributaries, and the Horseshoe Canyon drainage. • Provide semi-primitive motorized activity on designated routes. • Provide non-motorized access by means of trails, cross-country travel, and some primitive roads (access for people with	Canyon WSA, and the Happy Canyon—French Springs WSA.) • Manage the portions of the WSAs within the SRMA according to the IMP. • Manage the portions of the Dirty Devil/French Springs non-WSA lands with wilderness characteristics in accordance with the management prescriptions identified for these areas. • Manage SRMA for a high probability of experiencing solitude, closeness to nature, self-reliance, challenge, and risk in an unmodified and natural appearing environment with very low interaction or evidence of other users. • Provide opportunities for primitive and semi-primitive, non-motorized recreation within the Dirty Devil River corridor, its tributaries, and the Horseshoe Canyon drainage. • Provide semi-primitive motorized activity on designated routes.	the area, notably the ACEC values. (SRMA includes the Dirty Devil WSA, Horseshoe Canyon WSA, Fiddler Butte WSA, Happy Canyon—French Springs WSA, proposed Dirty Devil/North Wash ACEC and the suitable Dirty Devil River and tributary WSR segments.) • Manage SRMA consistent with prescriptions identified in the Dirty Devil North Wash ACEC, with direction provided in the IMP for WSAs, and with protection for WSR outstandingly remarkable values. • Manage SRMA for a high probability of experiencing solitude, closeness to nature, self-reliance, challenge, and risk in an unmodified and natural appearing environment with very low interaction or evidence of other users. • Provide non-motorized access on trails, cross-country and some primitive roads (access for people with disabilities would be most difficult). • Provide no site developments or only	the area, notably the ACEC values. (SRMA includes the Dirty Devil WSA, Horseshoe Canyon WSA, Fiddler Butte WSA, Happy Canyon—French Springs WSA, proposed Dirty Devil/North Wash ACEC and the suitable Dirty Devil River and tributary WSR segments.) • Manage SRMA consistent with: – Prescriptions identified in the Dirty Devil North Wash ACEC. – Direction provided in the IMP for WSAs. – Protection of WSR outstandingly remarkable values. – Protection of non-WSA lands with wilderness characteristics. • Manage SRMA for a high probability of experiencing solitude, closeness to nature, self-reliance, challenge, and risk in an unmodified and natural appearing environment with very low interaction or evidence of other users. • Provide non-motorized access on trails, cross-country and some primitive roads. (Access for people with

Table 2-15. Recreation Decisions

	disabilities would be most difficult). • Provide no site developments or only the minimum required for site protection, considering user comfort secondarily. • Provide no on-site interpretive facilities. • Manage to allow natural processes to achieve self-sustaining systems.	• Provide non-motorized access by means of trails, cross-country travel, and some primitive roads. (Access for people with disabilities would be most difficult.) • Provide no site developments or only the minimum required for site protection, considering user comfort secondarily. • Provide no on-site interpretive facilities. • Manage to allow natural processes to achieve self-sustaining systems.	the minimum required for site protection, with user comfort secondary in consideration. • Provide no on-site interpretive facilities. • Manage to allow natural processes to achieve self-sustaining systems.	disabilities would be most difficult.) • Provide no site developments or only the minimum required for site protection, with user comfort considered secondarily. • Provide no on-site interpretive facilities. • Manage to allow natural processes to achieve self-sustaining systems.
Manage OHVs according to existing area designations (Map 2-12).	Limit OHVs to designated routes.	Close canyons and portions of WSAs to OHV use. Limit OHVs to designated routes elsewhere (Table 2-16).	Close WSAs and WSR segments to OHV use except for limited designation in Poison Springs/North Hatch Canyon road corridor. Limit OHV use to designated routes in the portion of the SRMA outside the ACEC (Table 2-16).	Close WSAs and non-WSA lands with wilderness characteristics to vehicle use. Elsewhere in the SRMA, limit vehicles to designated roads and trails. Allow permitted access, where needed, to range developments and mining claims as identified in the activity plan (Table 2-16).
Continue dealing with recreation use conflicts on a case-by-case basis.	Consider limiting recreational activities if they conflict with other resources or users, if necessary. (Limitations could include numbers of people, season of use, or area of use.)			
Not applicable	• Develop an activity plan for the SRMA within 5 years to address developed facilities, special recreation permits (SRP), and special rules for protecting resources such as regulating campfire use, camping, sanitation, backcountry permits, group size, spatial and seasonal restrictions. *Implementation level decision.			

* *This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.*

Table 2-15. Recreation Decisions

	• Continue to issue current SRPs according to site-specific analysis already completed and according to existing permit stipulations. (SRPs are currently in place for commercial uses such as canyoneering, rock climbing, backpacking, hiking, guided hunting, and vehicle tours.) • Prior to completing the activity plan, issue additional similar SRPs, subject to the following stipulations: – Within one-half mile of canyon rims and below the rim, limit group size to 12 or fewer. Allow no commercial or organized group larger than 12 to operate in this area. – Allow only one commercial group to occupy the same side of the canyon at any one time. – Review itineraries prior to each operating season. – Allow no camping within one-half mile of Mexican spotted owl protected activity centers. Require all activities be consistent with the guidelines in the Mexican spotted owl recovery plan. – Allow no camping within the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater, of any spring or water sources in Desert bighorn sheep use areas during the lambing season (April 15–June 15). – Stipulate additional requirements, if needed, to protect sensitive species and their critical habitats. • Consider developing facilities to support the objectives of the SRMA, to provide for visitor health and safety, and for resource protection. • Locate facilities such as trailheads, instructional signs, group sites, and parking areas on the bench lands near existing access roads. • Address changes to OHV route designations, if needed. • Conduct environmental analysis on SRP proposals that do not meet the criteria above or that are different than existing SRPs.			
Continue managing oil and gas leasing according to existing LUPs and applicable law (Map 2-35).	Manage oil and gas leasing in SRMA (outside WSA) as follows: • Lease remaining areas subject to CSU and/or timing limitations. (Map 2-36)	Manage oil and gas leasing in SRMA (outside WSAs) as follows: • Lease VRM Class II areas and canyon rims within the viewshed of all canyons (approximately one-quarter mile), with major constraints (NSO). • Lease the remainder of the SRMA subject to CSU and/or timing limitations. (Map 2-37)	Manage oil and gas leasing in SRMA (outside WSAs, WSR corridors, and VRM Class II areas within Poison Springs Canyon and Happy Canyon) as follows: • Lease the remaining VRM Class II areas and canyon rims within the viewshed of all canyons (approximately one-quarter mile) with major constraints (NSO). • Lease the remainder of the SRMA subject to CSU and/or timing limitations.	Manage oil and gas leasing in SRMA (outside WSAs, WSR corridors and non-WSA lands with wilderness characteristics) as follows: • Lease the remainder of the SRMA as NSO or subject to CSU and/or timing limitations. (Map 2-39)

Manage OHVs in accordance with direction in existing LUP.	Manage OHVs in accordance with management direction in Table 2-16.	• Close WSAs and non-WSA lands with wilderness

Table 2-15. Recreation Decisions

				characteristics to OHVs. • Allow permitted access, where needed, to range developments and mining claims as identified in the activity plan.
Not applicable.				Complete an SRMA activity plan within 5 years of the RMP ROD.
Issue: Management of Recreational Opportunities Around Yuba Reservoir				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue implementing the current *Yuba Reservoir Management Plan*.	Implement the *Yuba Reservoir Management Plan*, as revised by the Fillmore FO.			
Issue: Overall Special Recreation Permit (SRP) Guidance				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Permit no competitive events in WSAs.				
Issue: Criteria for Commercial SRPs				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Current plans provide no guidance on SRPs. Issue SRPs on a case-by-case basis.	Authorize commercial use permits that provide recreational opportunities, enhance recreational experiences, and protect resources on a case-by-case basis, subject to environmental analysis.			

Table 2-15. Recreation Decisions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Issue: Criteria for Competitive SRPs				
Management Actions				
Current plans provide no guidance on competitive events.	• Authorize motorized and non-motorized competitive events consistent with OHV area and route designations on a case-by-case basis, subject to environmental analysis. • Permit no competitive events in the Dirty Devil/Robbers Roost SRMA.			
Issue: Criteria for Organized Group SRPs				
Management Actions				
Current plans provide no guidance on regulating organized groups.	Require SRPs for organized groups outside designated large group areas meeting any *one* of the following criteria: • Group includes 50 or more participants. • Group uses 10 or more vehicles.			
Issue: Criteria for Vending				
Management Actions				
Current plans provide no guidance on vending.	• Authorize vending on a case-by-case basis subject to environmental analysis in conjunction with organized events or when the vending is necessary to support protection of resources or recreational use. • Authorize vending permits for uses that enhance recreational experiences.	• Authorize vending on a case-by-case basis subject to environmental analysis in conjunction with organized events or when the vending is necessary to support protection of resources or recreational use. • Authorize vending permits for uses that enhance recreational experiences. • Authorize no vending along scenic byways and backways.	• Allow no vending in conjunction with organized events. • Authorize no vending along scenic byways and backways.	

Travel Management

Table 2-16. Travel Management Decisions

Desired Outcomes (Goals and Objectives)				
• Maintain existing access, where needed and allowed, to meet public and administrative needs, including acquiring or maintaining necessary access across non-Federal land. • Continue compatible traditional, current, and future use of the land by establishing a route system that contributes to protection of sensitive resources, accommodates a variety of uses, minimizes user conflicts, and is sustainable. • Consider public access, resource management, and regulatory needs through transportation planning. • Coordinate OHV management with other agencies where possible (USFS, NPS, State of Utah, counties, and communities).				
Issue: OHV Area Designations				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• The BLM, in preparing its RMP designations and its implementation-level travel management plans, is following policy and regulation authority found at: 43 C.F.R. Part 8340; 43 C.F.R. Subpart 8364; and 43 C.F.R. Subpart 9268. • Where the authorized officer determines that OHVs are causing or would cause considerable adverse impacts, the authorized officer shall close or restrict such areas. The public would be notified. • The BLM could impose limitations on types of vehicles allowed on specific designated routes if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, wildlife habitat, cultural or vegetative resources, especially by off-road travel in an area that is limited to designated routes. • Site-specific management actions that protect riparian areas would be addressed at the project level. • Designate WSAs as closed or limited to designated ways for OHV use (Table 2-19, WSA decisions for details). • If OHV use in areas designated as open or limited causes threats or adverse impacts to resources, take appropriate steps, including, but not limited to, use restrictions or closures, installation of additional signs and barricades, restoration of affected areas, etc.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue existing OHV area designations as follows (Map 2-12): • Open: 1,636,400 acres • Limited: 277,600 acres – Existing routes: 271,000 acres – Designated routes: 4,900 acres	Provide motorized access to the public lands with the minimum restrictions needed to protect other resources. Designate areas as follows (Map 2-13): • Open: 449,000 acres • Limited: 1,679,000 acres	Balance motorized access to public lands with other resource and resource use needs. Designate areas as follows (Map 2-14): • Open: 9,890 acres • Limited: 1,908,210 acres • Closed: 209,900 acres.	Restrict motorized access to public lands to protect other resources and resource uses. Designate areas as follows (Map 2-15): • Open: 0 acres • Limited: 1,445,000 acres • Closed: 683,000 acres.	Restrict motorized access to public lands to protect other resources and resource uses. Designate areas as follows (Map 2-16): • Open: 0 acres • Limited: 972,800 acres • Closed: 1,155,200 acres.

Table 2-16. Travel Management Decisions

– Maintained routes: 1,700 acres • Closed: 214,000 acres. Continue to manage OHV use in accordance with the *Notice of OHV Travel Restriction* for motorized use in the Factory Butte Area, published September 20, 2006 (2,602 acres open to OHV use, 142,023 acres limited to designated routes, and 3,843 acres of North Caineville Mesa closed to OHV use). This restriction will remain in effect until the RFO RMP becomes final.	• Closed: 0 acres.			
Issue: Designation of Managed Open Areas				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue to manage existing open areas.	Designate the following managed open areas: • **Ticaboo Play Area** (19,000 acres. Cane Spring Desert east of Ticaboo)—Designate and manage as an OHV open area to accommodate existing use and growth, provide alternative modes of recreation adjacent to Glen Canyon National Recreation Area (NRA), and provide opportunities for economic development.	Designate the following managed open areas: • **Factory Butte Play Area** (5,800 acres)—Designate and manage as an OHV open area to provide a unique OHV riding experience on Mancos shale badlands to accommodate existing use and future growth. • **Swing Arm City Play Area** (2,600 acres)—Designate and manage as an OHV open area. • **Caineville Cove Inn**	Designate no OHV open areas.	

Table 2-16. Travel Management Decisions

	• **Sahara Sands Play Area** (12,000 acres. Northeast of Hwy 95/276 junction)—Designate and manage as an OHV open area to provide a sand dune riding opportunity, accommodate existing use and growth, provide alternative modes of recreation adjacent to Glen Canyon NRA, and provide opportunities for economic development. • **Roost Play Area** (19,000 acres. Northwest of Antelope Valley)—Designate and manage as an OHV open area to provide a sand dune riding opportunity and to accommodate existing use and future growth. • **Factory Butte Play Area** (200,000 acres. Near Caineville and Notom)—Designate and manage as an OHV open area to provide a Mancos shale riding opportunity and to accommodate existing use and future growth. • **Miners Mountain** (9,500 acres. Southeast	**Play Area** (100 acres)— Designate and manage as an OHV open area. • **Big Rocks Trials Play Area** (90 acres)—Designate and manage as an OHV open area to provide trials motorcycle/rock crawling OHV recreational opportunity. • **Glenwood Play Area** (1,000 acres)—Designate as an OHV open area and manage as a community OHV area. • **Aurora Play Area** (300 acres)—Designate as an OHV open area and manage as a community OHV area.	

Table 2-16. Travel Management Decisions

	of Torrey)—Designate and manage as an OHV open area to accommodate dispersed camping, prospecting, firewood cutting, game retrieval, and other traditional uses of the land. • **Beas Lewis Flat** (4,500 acres. East of Torrey)—Designate and manage as an OHV open area to accommodate dispersed camping, prospecting, firewood cutting, game retrieval, and other traditional uses of the land. • **Big Rocks Dispersed Recreation Area** (9,000 acres. South of Loa)—Designate and manage as an OHV open area to accommodate trials motorcycle/rock crawling use and dispersed camping. • **Dry Wash** (6,500 acres. East of Antimony)—Designate and manage as an OHV open area to accommodate dispersed camping, prospecting, firewood cutting, game retrieval and other traditional uses of the land.		

Table 2-16. Travel Management Decisions

	• **Hunter Spring** (4,500 acres. West of Antimony)—Designate and manage as an OHV open area to accommodate dispersed camping, prospecting, firewood cutting, game retrieval, and other traditional uses of the land. • **Otter Creek Reservoir** (1,000 acres. Public land around the reservoir)—Designate and manage as an OHV open area west of the reservoir to accommodate dispersed camping and access to Otter Creek Reservoir and nearby OHV trails. • **Antelope Range/Kingston Canyon** (102,000 acres. Southern Sevier County and western Piute County)—Designate and manage as an OHV open area to accommodate prospecting, firewood cutting, game retrieval, dispersed camping, and other traditional uses of the land. • **Glenwood Play Area** (3,500 acres. East of Glenwood)—Designate		

Table 2-16. Travel Management Decisions

	as an OHV open area and manage as a community OHV area. • **Richfield to Aurora Play Area** (7,000 acres. West of I-70)—Designate as an OHV open area and manage as a community OHV area. • **Rocky Ford Play Area** (12,500 acres. East of Rocky Ford Reservoir)—Designate as an OHV open area and manage as a community OHV area. • **White Hills Play Area** (16,500 acres. North of Aurora.)—Designate as an OHV open area and manage as a community OHV area. • **Fayette Play Area**—(4,500 acres. West of Fayette)—Designate as an OHV open area and manage as a community OHV area. • **Salina to Mayfield** (12,500 acres. North and east of Salina and west of Mayfield)—Designate as an OHV open area and manage as a community OHV area. • **Gunnison Reservoir** (5,500 acres. West of		

Table 2-16. Travel Management Decisions

	Gunnison Reservoir)—Designate and manage as an OHV open area to provide access to the west side of the reservoir and an associated open OHV area.			
Issue: Management of OHV Play Areas Adjacent to Communities				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Consider and promote leasing the identified OHV open areas near communities such as Caineville, Glenwood, Aurora, and Loa (e.g. Big Rocks SRMA) under Recreation and Public Purposes Act (R&PP) authorities to encourage local management of OHV play areas. Generally these would include areas with existing surface disturbance. Requests would be considered on a case-by-case basis, subject to an environmental analysis			Consider no requests for R&PP leases for OHV open play areas.	
Issue: Designation of Areas as Closed to All Motorized Vehicular Traffic				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• Prohibit all motorized travel in closed areas, with the following exceptions: – For emergency and other purposes as authorized under 43 CFR 8340.0-5(a)(2),(3),(4) and (5); – Minimum use necessary to exercise a valid existing right or authorized use.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue existing closed areas. (Map 2-12) • **WSAs:** To prevent impairment of the areas' suitability for preservation as wilderness. – Little Rockies WSA – Portions of the Dirty Devil, Fiddler Butte, Mount Ellen/Blue Hills, and Mount	Close no areas to motorized use. (Map 2-13)	Close the following areas to motorized use. (Map 2-14) • **WSAs:** To prevent impairment of the areas' suitability for preservation as wilderness. – Little Rockies WSA – Portions of the Dirty Devil, Fiddler Butte, Fremont Gorge, French	Close the following areas to motorized use. (Map 2-15) • **WSAs:** All WSAs, to prevent impairment of the areas' suitability for preservation as wilderness. • **WSRs:** All segments proposed to protect outstandingly remarkable river-related values. (Refer to Table	Close the following areas to motorized use. (Map 2-16) • **WSAs:** All WSAs, to prevent impairment of the areas' suitability for preservation as wilderness. • **Non-WSA Lands with Wilderness Characteristics:** All non-WSA lands with wilderness

Table 2-16. Travel Management Decisions

Hillers WSAs. • **ACECs:** All of the existing ACECs as specified by management prescriptions to protect relevant and important values. – North Caineville Mesa ACEC – South Caineville Mesa ACEC (overlaps a portion of Mt. Ellen/Blue Hills WSA) – Beaver Wash Canyon ACEC (overlaps a portion of Dirty Devil WSA) – Gilbert Badlands ACEC (overlaps a portion of Mt. Ellen/Blue Hills WSA). • **Trough Hollow:** to protect cultural resources in this area.		Spring/Happy Canyon, Horseshoe Canyon North, Horseshoe Canyon South and Mount Ellen/Blue Hills WSAs. • **WSRs:** to protect outstandingly remarkable values. (Refer to Table 2-20, Wild and Scenic River Decisions) – Fremont Gorge Suitable Wild River. • **ACECs:** to protect R & I values (Refer to Table 2-21, ACEC Decisions) – North Caineville Mesa ACEC – Old Woman Front ACEC. • **SRMAs:** Portions of the proposed SRMAs to retain the desired recreation setting and for consistency with other management decisions. (Refer to Table 2-15, Recreation Decisions) – Dirty Devil SRMA – Fremont Gorge SRMA – Factory Butte SRMA (Landmarks RMZ).	2-20, Wild and Scenic River Decisions) • **ACECs:** As specified by management prescriptions to protect relevant and important values. (Refer to Table 2-21, ACEC Decisions) – Old Woman Front ACEC – Rainbow Hills ACEC – A portion of the Badlands ACEC (mesa tops) – A portion of the Henry Mountains ACEC (No Man's Mesa). • **SRMAs:** Portions of the proposed SRMAs to retain the desired recreation setting, scenic values, and for consistency with other management decisions. In areas where the proposed SRMAs overlap WSAs and/or WSRs, the decisions in those sections would apply to the SRMA. (Refer to Table 2-15, Recreation Decisions) – Dirty Devil SRMA – Henry Mountains SRMA – Capitol Reef Gateway SRMA.	characteristics, to protect their naturalness and opportunities for solitude and primitive recreation. • **WSRs:** All segments proposed to protect outstandingly remarkable river-related values. (Refer to Table 2-20, Wild and Scenic River Decisions) • **ACECs:** As specified by management prescriptions to protect relevant and important values and for consistency with other management decisions. In areas where the potential ACECs overlap WSAs, non-WSA lands and/or WSRs, the decisions in those sections would apply to the ACEC. (Refer to Table 2-21, ACEC Decisions) – All of the Old Woman Front, Rainbow Hills, Dirty Devil, Horseshoe Canyon, and Lower Muddy Creek ACECs – Portions of the Badlands, Bull Creek, Fremont Gorge/Cockscomb, Henry Mountains,

Table 2-16. Travel Management Decisions

				Kingston Canyon, Little Rockies, Quitchupah, and Thousand Lakes Bench ACECs • **SRMAs:** As identified by management actions to retain the desired recreation settings, scenic values and for consistency with other management decisions. In areas where the proposed SRMAs overlap WSAs, non-WSA lands and/or WSRs, the decisions in those sections would apply to the SRMA. (Refer to Table 2-15, Recreation Decisions) – Little Rockies SRMA – Portions of the E. Fork Sevier, San Rafael Swell, Dirty Devil, Capitol Reef Gateway, Henry Mountains, and Labyrinth Canyon SRMAs.
Issue: Designation of Limited Areas				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue managing 277,600 acres identified on Map 2-12 as limited to OHV use as identified in current LUPs.	Manage 1,679,000 acres identified on Map 2-13 as limited to designated routes or designated routes with seasonal closures or size/	Manage 1,908,210 acres identified on Map 2-14 as limited to designated routes or designated routes with seasonal closures or size/	Manage 1,445,000 acres identified on Map 2-15 as limited to designated routes or designated routes with seasonal closures or size/	Manage 972,800 acres identified on Map 2-16 as limited to designated routes or designated routes with seasonal closures or size/

Table 2-16. Travel Management Decisions

	width restrictions.	width restrictions.	width restrictions.	width restrictions.
Issue: Route Designation and Vehicle Use within Limited Areas				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• Prohibit all cross-country (off-transportation system) motorized travel in limited areas, with the following exceptions: – For emergency and other purposes as authorized under 43 CFR 8340.0-5(a)(2),(3),(4) and (5). • Coordinate OHV route designations with USFS, NPS, State of Utah, counties, and communities, where possible. • Rehabilitate closed OHV routes on a case-by-case basis as required to mitigate impacts to resources. Closed or non-designated routes would be allowed to rehabilitate naturally unless a specific resource impact was occurring that warranted expedited rehabilitation of the route (e.g., soil erosion, water quality concerns, and/or continued illegal use). • Route designations are implementation decisions that are subject to change based upon future site-specific environmental analysis. Appendix 9 provides additional details of the travel management/route designation process, the implementation process, and the process that would be required to add or remove route designations following completion of the RMP.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Where routes would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs – see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or non-compliance are found through monitoring efforts to impair the area's suitability for wilderness designation, BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and non-impairment of wilderness values.			Not applicable (all WSAs are closed to motorized travel).	
Designate existing, inventoried routes for motorized use in accordance with existing LUP direction.	Designate routes or ways for motorized use unless significant, undue damage to or disturbance of the soil, wildlife, wildlife habitat, improvements, cultural or vegetative resources, or other authorized uses of the public lands is imminent, or to prevent impairment of an area's suitability for wilderness (within WSAs).	• Designate routes for motorized use unless significant, undue damage to or disturbance of the soil, wildlife, wildlife habitat, improvements, cultural or vegetative resources, or other authorized uses of the public lands is imminent.	• Designate routes for motorized use unless significant, undue damage to or disturbance of the soil, wildlife, wildlife habitat, improvements, cultural, or vegetative resources or other authorized uses of the public lands is imminent. • Designate routes to	• Designate routes for motorized use unless significant, undue damage to or disturbance of the soil, wildlife, wildlife habitat, improvements, cultural or vegetative resources, or other authorized uses of the public lands is imminent, and to

Table 2-16. Travel Management Decisions

		• Designate routes to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protecting SSS and their habitats. • Designate routes to minimize conflicts between OHV use and other existing or proposed recreational uses of the same or neighboring public lands, and to ensure the compatibility of such uses with existing conditions in populated areas, taking into account noise and other factors.	prevent harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protecting SSS and their habitats. • Designate routes to prevent conflicts between OHV use and other existing or proposed recreational uses of the same or neighboring public lands, and to ensure the compatibility of such uses with existing conditions in populated areas, taking into account noise and other factors. • Designate no ways within WSAs.	prevent impairment of wilderness characteristics. • Designate routes to prevent harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protecting SSS and their habitats. • Designate routes to prevent conflicts between OHV use and other existing or proposed recreational uses of the same or neighboring public lands, and to ensure the compatibility of such uses with existing conditions in populated areas, taking into account noise and other factors. • Designate no ways within WSAs. • Designate no routes in non-WSA lands with wilderness characteristics.
Issue: Identification of Routes Where Seasonal Closures Are Needed to Protect Deer and Elk				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Not specifically addressed in existing plans.	No specific restrictions within crucial habitat.	Limit OHV use to designated routes in deer and elk crucial winter range, except for Glenwood and Aurora Managed Open Areas.	Close identified routes in deer and elk crucial winter range seasonally (December 1–April 15) to protect wildlife values.	

Table 2-16. Travel Management Decisions

		Consider seasonal closure of designated routes on a case-by-case basis, subject to environmental analysis. (Maps 3-6 and 3-7)		
Issue: Identification of Routes Where Seasonal Closures Are Needed to Protect Bison in the Henry Mountains				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue seasonal (December 20–March 20) closures in bison crucial habitat at Swap Mesa and Cave Flat.	Limit OHV use to designated routes in bison crucial habitat. Consider seasonal closure of designated routes on a case-by-case basis. (Map 3-5)		Manage OHV use in bison habitat as closed or limited to designated routes, according to the prescriptions outlined in the Henry Mountains ACEC (Table 2-21).	
Summary of Route Designations, For Proposed RMP and Draft Alternatives*				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Route designations are implementation decisions that are subject to change in the future based on site-specific environmental analyses.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Designated routes: 4,315 miles • Designated routes with seasonal closures or size/ width restriction: 0 miles • Closed routes: 65 miles	• Designated routes: 4,063 miles • Designated routes with seasonal closures or size/ width restriction: 249 miles • Closed routes: 68 miles (Map 2-17)	• *Designated routes: 3,739 miles* *Implementation level decision. • Designated routes with seasonal closures or size/ width restriction: 538 miles *Implementation level decision. • Closed routes: 345 miles *Implementation level decision.	• Designated routes: 2,601 miles • Designated routes with seasonal closures or size/ width restriction: 591 miles • Closed routes: 1,188 miles (Map 2-19)	• Designated routes: 2,493 miles • Designated routes with seasonal closures or size/ width restriction: 591 miles • Closed routes: 1,296 miles (Map 2-20)

* *This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.*

Table 2-16. Travel Management Decisions

		(Map 2-18)		
Issue: Motor Vehicle Access for Parking/Staging in OHV Limited Areas Outside WSAs				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Place no restrictions on motorized use off a designated route for the purposes of parking/staging.	Allow motor vehicles to pull off a designated route up to 100 feet of either side of the centerline for the purposes of parking/staging.	Allow motor vehicles to pull off a designated route up to 50 feet of either side of the centerline for the purposes of parking/staging.	Allow motor vehicles to pull off of a designated route up to 25 feet of either side of the centerline for the purposes of parking/staging.	
Issue: Motor Vehicle Access to Campsites in OHV Limited Areas Outside WSAs				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Place no restrictions on motorized access to campsites, in accordance with current LUPs.	• Allow motor vehicles to use existing spur routes for ingress and egress to established campsites within 300 feet of the centerline of designated routes. (Previous campsites can be distinguished by evidence of rock fire rings, old tent sites, and tracks from earlier vehicle access.) This does not authorize creation of new campsites or travel ways. • Prohibit motorized travel ways between multiple campsites, establishment of motorized play areas, race tracks, or travel across wet meadows or	• Allow motor vehicles to use existing spur routes for ingress and egress to established campsites within 150 feet of designated routes. (Previous campsites can be distinguished by evidence of rock fire rings, old tent sites, and tracks from earlier vehicle access.) This does not authorize creation of new campsites or travel ways. • Prohibit motorized travel ways between multiple campsites, establishment of motorized play areas, race tracks, or travel across wet meadows or	• Designate campsites for motor vehicle use where compatible with other resources and resource uses. • Prohibit motorized travel ways between multiple campsites, establishment of motorized play areas, race tracks, or travel across wet meadows or riparian areas. • Prohibit motorized access to camping areas where conflicts with other resources are identified.	

Table 2-16. Travel Management Decisions

	riparian areas. • Prohibit motorized access to camping areas where conflicts with other resources are identified.	riparian areas. • Prohibit motorized access to camping areas where conflicts with other resources are identified.		
Issue: Motor Vehicle Access to Campsites and for Parking/Staging in OHV Limited Areas Within WSAs				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Require vehicles to stay on designated ways or cherry-stemmed routes within WSAs, in accordance with IMP direction.			Not applicable (All WSAs are closed to motorized travel.)	
Issue: Game Retrieval				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Not specifically addressed in existing plans.	Do not allow use of non-motorized wheel carriers to retrieve game kills inside of WSAs.		Preclude the use of game carriers off designated routes.	
Issue: Management of Paiute ATV Trail and Great Western Trail				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Cooperatively manage with the USFS, State of Utah, and local governments the portions of the Paiute ATV Trail and Great Western Trail systems that lie on public lands managed by the RFO.				

Lands and Realty

Table 2-17. Lands and Realty Decisions

Desired Outcomes (Goals and Objectives)
• Retain public lands in federal ownership, unless it is determined that disposal of a particular parcel will serve the public interest. • Emphasize a balanced program of disposals, acquisitions, and land exchanges in conducting land tenure adjustments. • Consider land tenure adjustments to improve land ownership patterns, accomplish resource management goals, and accommodate community expansion and economic development needs. • Support alternative energy development purposes, such as wind and solar energy resources, and coordinate with other resource objectives. • Use ROW corridors and collocate new proposals within existing sites or ROW areas, to the extent practical, in order to minimize adverse environmental impacts and the proliferation of separate ROWs. • Retain in federal ownership, public lands that enhance multiple-use management, allow access to public lands, or contain sensitive or rare resources. • Acquire lands or interests in lands to complement existing resource values and uses. • Consider for disposal lands or interests in lands that are difficult and/or uneconomical to manage, or are no longer needed for federal purposes. • Consider land or interest in land for disposal if: 1) it was acquired for a specific purpose and is no longer required for that or any other federal purpose; 2) said land would serve important public objectives that cannot be achieved prudently or feasibly on lands other than public lands and that outweigh other public objectives and values, or; 3) because of its location or other characteristics is difficult and uneconomic to manage as part of the public lands and is not suitable for management by another federal department or agency. The method used to identify the parcels considered for disposal (Appendix 5) included: FLPMA Section 203 sales criteria, land tenure adjustment criteria (identified in Appendix 5), a BLM inter-disciplinary team review of land status ownership maps, historical index, the LR 2000 database, and resource information. • As per the State of Utah v. Andrus, Oct. 1, 1979 (Cotter Decision), the BLM would grant the State of Utah reasonable access to state lands for economic purposes, on a case-by-case basis.
Issue: Land Tenure Adjustments General Direction
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• For any form of land tenure adjustment (including, but not limited to, exchanges, in lieu selections, state grants, desert land entries, R&PP patents, easement acquisitions, etc.), except for FLPMA Section 203 sales, ensure it meets one or more of the following criteria: – Is in the public interest and accommodates the needs of state, local, or private entities, including needs for the economy, community growth and expansion, and be in accordance with other land use goals, objectives, and planning decisions – Results in a net gain of important and manageable resource values on public lands such as crucial wildlife habitat, significant cultural sites, high-value recreation areas, high-quality riparian areas, live water, SSS habitat, or areas key to maintenance of productive ecosystems – Ensures the accessibility of public lands in areas where access is needed and cannot otherwise be obtained; – Is essential to allow effective management of public lands in areas where consolidation of ownership is necessary to meet resource management objectives – Is not suitable for management by another federal department or agency

Table 2-17. Lands and Realty Decisions

- Results in the acquisition of lands that serve a national priority as identified in national policy directives.

- In addition to the above criteria, require a site-specific environmental analysis in accordance with NEPA for all future land disposal actions. Critical Elements of the Human Environment and other resource issues identified through public and agency involvement would be adequately considered and appropriately evaluated. Certain elements of the human environment are subject to requirements specified in statutes, regulations, or executive orders. Program-specific consultation would occur (if required), and respective on-site surveys and documented clearances would be obtained prior to any land disposal action. This subsequent analysis and documentation may reveal resource conditions that could not be mitigated to the satisfaction of the authorized officer and may, therefore preclude disposal.
- Ensure all land tenure adjustments must be in conformance with other decisions (goals, objectives, management actions) within this RMP.
- Habitat for listed and candidate T&E species are generally required to be retained in Federal ownership. Consider exceptions in disposal actions with the State of Utah and others with consultation with and concurrence of the USFWS.
- Permit surface lands identified for disposal with unpatented mining claims to be conveyed if the purchaser is the mining claimant, or the mining claims are relinquished if the purchaser is other than the mining claimant.
- Issue patents for existing shooting ranges [Appendix 5, Table A5-11]). No portions of these R&PP patented lands, under any circumstances, would revert to the United States if any such portion was used for solid waste disposal or for any other purpose that may result in the disposal, placement, or release of any hazardous substance.
- Where consistent with the goals and objectives of the RMP, classify as suitable for lease and/or disposal under Section 7 of the Taylor Grazing Act of 1934, as amended, lands disposed of or leased under the R&PP Act, Desert Land Entry (DLE) Act, Color of Title, Carey Act, and state grants.
- As the preferred method, manage OHV Open Play Areas located near communities by issuing a lease or patent under the R&PP Act, and have the relevant state, county, or local community manage the areas.
- Pursue land acquisitions from willing sellers when lands:
  - Are within or adjacent to WSAs, ACECs, WSRs, or other special designations
  - Are associated with key fisheries or wildlife habitats and riparian zones
  - Provide linkage or public access to other public lands
  - Have significant paleontological or cultural resources
  - Provide high recreation or other significant resource or public values
  - Are needed to improve manageability of public lands.
- Give land exchanges with the State of Utah priority consideration to resolve inholdings issues.

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
• Retain all eligible WSR segments (12 segments—135 miles) in federal ownership, unless such action would benefit outstandingly	• Maintain important recreational values and sites in federal ownership • The Utah BLM Riparian Management Policy identifies that Riparian	• Retain the suitable WSR segment (1 segment—5 miles) in federal ownership, unless such action would benefit outstandingly	• Retain all suitable WSR segments (12 segments—135 miles) in federal ownership, unless such action would benefit outstandingly	• Retain all suitable WSR segments (12 segments—135 miles) in federal ownership, unless such action would benefit outstandingly

Issue: FLPMA Section 203 Sales				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue to offer for sale lands identified in the *Mountain Valley MFP* (280 of the acres identified are still available).	Make approximately 13,400 acres of public land available for FLPMA Section 203 sales (as listed in Appendix 5 and shown on Maps 2-21 through 2-25) subject to NEPA compliance and consistent with other decisions in this RMP.		Consider no lands for FLPMA Section 203 sales.	
Issue: Withdrawals, Classifications, and Segregations				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Review existing withdrawals to determine whether they are serving the purposes for which they were withdrawn. (Existing withdrawals are listed in Table A5-7 in Appendix 5.) • Manage any lands becoming unencumbered by withdrawals in a manner consistent with adjacent or comparable public land within the RFO. • Review existing classifications and segregations on a case-by-case basis to determine whether the classification or segregation is appropriate and should be continued, modified, or terminated.				
Continue existing withdrawals (154,700 acres). Recommend withdrawing the following developed recreation sites from mineral entry: • Lonesome Beaver Campground • McMillan Spring Campground • Starr Springs Campground	Continue existing withdrawals (154,700 acres).	Continue existing withdrawals (154,700 acres). Recommend withdrawing the following areas from mineral entry (Map 2-27): • North Caineville Mesa ACEC • Old Woman Front ACEC • Fremont (Fremont Gorge) suitable wild river within one-quarter mile of each side of	Continue existing withdrawals (154,700 acres). Table 2-17. Lands and Realty Decisions

• Dandelion Flat Picnic Area • Hog Springs Picnic Area. Recommend withdrawing the four existing ACECs (14,780 acres) from mineral entry. Total acres: 169,480		high water mark on each bank of the river • Developed recreation sites, including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area. New recommended acres: 21,500 Total acres: 176,200	• Developed recreation sites, including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area Recommend withdrawing the VRM Class II portions of the following ACECs from mineral entry (see ACEC prescriptions for details): • Dirty Devil/North Wash ACEC • Fremont Gorge/ Cockscomb ACEC • Badlands ACEC • Henry Mountains ACEC • Horseshoe Canyon ACEC • Little Rockies ACEC. New recommended acres: 176,400 Total acres: 331,100	• All areas identified as non-WSA lands with wilderness characteristics. • Developed recreation sites, including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area Recommend withdrawing the VRM Class II portions of the following ACECs from mineral entry (see ACEC prescriptions for details): • Dirty Devil/North Wash ACEC • Fremont Gorge/ Cockscomb ACEC • Badlands ACEC • Henry Mountains ACEC • Horseshoe Canyon ACEC • Little Rockies ACEC. New recommended acres: 749,200 Total acres: 903,900

Table 2-17. Lands and Realty Decisions

Issue: Management of ROWs				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
In existing ROWs, authorize culinary water source developments (Culinary Water Sources Table A5-12 in Appendix 5) subject to valid existing rights and future land use authorizations to ensure that they do not lead to degradation, pollution, or contamination of water supply. When compatible, require multiple communication site users to share the same sites and buildings, and use the same facilities. See Existing Communication Sites Table A5-10 in Appendix 5. Continue to maintain roads for resource management purposes. Consider obtaining easements across non-federal land to: • Provide public access • Enhance resource management in key fishery and wildlife habitats and riparian zones • Cooperate with other federal, state, and local governing agencies, organizations, tribes, and private individuals in obtaining ROW easements • Enhance resource management.				
Issue: ROW Avoidance and Exclusion Areas				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Apply the spatial and temporal restrictions outlined in Table 2-9, Fish and Wildlife Decisions to ROW construction and maintenance activities. These restrictions do not apply to emergency maintenance.				
Manage the following as ROW avoidance areas (Map 2-30): • WSAs • ACECs • Eligible WSR corridors • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.	Manage the following as ROW avoidance or exclusion areas (Map 2-31): • WSAs • Areas closed to oil and gas leasing.	Manage the following as ROW avoidance areas (Map 2-32): • ACECs • Non-WSA lands with wilderness characteristics • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations. Manage the following areas as exclusion areas: • Areas closed to oil and	Manage the following as ROW avoidance or exclusion areas (Map 2-33): • WSAs • ACECs • Suitable WSR corridors • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.	Manage the following as ROW avoidance or exclusion areas (Map 2-34): • WSAs • ACECs • Suitable WSR corridors • Non-WSA lands with wilderness characteristics • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.

Table 2-17. Lands and Realty Decisions

		gas leasing • WSAs. • Suitable WSR corridor-Fremont Gorge		
Consider exceptions in the avoidance areas on a case-by-case basis if the proposed ROW would: • Not create substantial surface disturbance or would cause only temporary impacts • Be compatible with the resource values being protected by the goals and objectives of the avoidance areas • Be consistent with management prescriptions for ACECs and WSRs and pose no irreversible or irretrievable impacts (Proposed RMP and Draft Alternatives N, C and D) • Be consistent with the goals and objectives of the identified non-WSA lands with wilderness characteristics (Proposed RMP and Draft Alternative D).				
Issue: Management of Wind and Solar Energy Development				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Not specifically addressed in existing plans.	For authorization of any ROW for wind or solar energy development, incorporate best management practices (BMP) and provisions contained in the Wind Energy Development Program Record of Decision (Appendix 15 of this Proposed RMP/Final EIS and BLM 2005d) and BLM's Solar Energy Policy.			
Consider wind and solar energy exploration and development on a case-by-case basis.	Consider proposals for wind and solar energy exploration and development throughout the RFO with the following exceptions: • WSAs (ROW exclusion areas in accordance with IMP).	Consider proposals for wind and solar energy development throughout the RFO except within the following areas: • WSAs (ROW exclusion areas in accordance with IMP) • Fremont (Fremont Gorge) suitable wild river corridor • ACECs • Areas open to oil and gas leasing with NSO and areas closed to leasing. • VRM Class I and II	Consider proposals for wind and solar energy development throughout the lands administered by the RFO except within the following areas: • WSAs (ROW exclusion areas in accordance with IMP) • Suitable WSR corridors • ACECs • Areas open to oil and gas leasing with NSO and areas closed to leasing • VRM Class I and II areas	Consider proposals for wind and solar energy development throughout the lands administered by the RFO except within the following areas: • WSAs (ROW exclusion areas in accordance with IMP) • Non-WSA lands with wilderness characteristics • Suitable WSR corridors • ACECs • Areas open to oil and gas leasing with NSO and areas closed to

Table 2-17. Lands and Realty Decisions

		areas • Migratory bird habitats and raptor nesting complexes • Threatened & Endangered Species habitats Consider proposals for wind and solar energy exploration throughout the RFO managed lands. Except for WSAs, exploration may be allowed within special management areas if the proposal would not adversely affect the resources of concern.	• Migratory bird habitats and raptor nesting complexes • SSS habitats Consider proposals for wind and solar energy exploration throughout the RFO managed lands. Except for WSAs, exploration may be allowed within special management areas if the proposal would not adversely affect the resources of concern.	leasing. • VRM Class I and II areas • Migratory bird habitats and raptor nesting complexes • SSS habitats Consider proposals for wind and solar energy exploration throughout the RFO managed lands. Except for WSAs, exploration may be allowed within special management areas if the proposal would not adversely affect the resources of concern.
Issue: Transportation and Utility Corridors				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
• To minimize adverse environmental impacts and the proliferation of separate ROWs, use common ROWs whenever possible, including collocation of new utility transmission lines and other facilities within existing utility and highway corridors. • Carry forward to or amend the Richfield RMP with any decisions on designation of energy corridors contained within the "West-wide Energy Corridor Programmatic EIS" currently being developed separately from this RMP analysis that affect public lands in the RFO.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Designate no transportation and utility corridors.	Designate those transportation and utility corridors listed in Appendix 5.			
Issue: Leases (Including R&PP Leases), Permits, and Easements				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Consider authorizing leases, permits, and easements that are compatible with other decisions throughout this RMP.				

Minerals and Energy

Table 2-18. Minerals and Energy Decisions

Desired Outcomes (Goals and Objectives)
• Manage conservation of leasable mineral resources using appropriate best management practices, and without compromising the long-term health and diversity of public lands. • Manage mining claim location, prospecting, and mining operations in a manner that would not cause unnecessary or undue degradation of public lands and resources. • Provide salable minerals needed for community and economic purposes while minimizing impacts to other resource values. • Encourage and facilitate the development by private industry of public land mineral resources in a manner that satisfies national and local needs and provides for economical and environmentally sound exploration, extraction, and reclamation practices using appropriate BMPs. • Support the domestic need for energy resources.
Issue: Management of Fluid Mineral Leasing (Oil and Gas, and Coalbed Natural Gas)
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• Issue oil and gas leases and allow for oil and gas exploration and development. • Continue closure of WSAs to leasing, pursuant to the federal onshore Oil and Gas Leasing Reform Act of 1987. • To the extent allowed by a site-specific environmental analysis that justifies a constraint, consistent with 43 CFR 3101.1-2, and consistent with the terms of an existing lease, apply the constraints and requirements for leasing implemented in this RMP to leases that were authorized prior to the signing of the ROD and the approval of the RMP. • Manage the following sites as closed to leasing: – Incorporated municipalities. • Manage the following additional sites as open to leasing with NSO, except as otherwise provided in other management decisions: – All cemeteries – Culinary water sources – Landfills—existing and closed – Lands managed under a R&PP lease – Sites listed on the NRHP – Developed recreation sites – BLM administrative sites. • Lease split-estate lands according to BLM RMP stipulations for adjacent or nearby public lands or plans of other surface management agencies as consistent with federal laws, 43 CFR 3101, and the surface owner's rights. • Work cooperatively with stakeholders to research interim measures, such as those presented by the Four Corners Air Quality Task Force (i.e., limits of 2g/bhp-hr on engines less than 300 HP), to determine which emission mitigation strategies should be required as conditions for future lease and land use authorizations.

Table 2-18. Minerals and Energy Decisions

- Site-specific management actions that protect riparian areas would be addressed at the project level.
- In accordance with an UDEQ-DAQ letter dated June 6, 2008, (see Appendix 21) requesting implementation of interim nitrogen oxide control measures for compressor engines; BLM will require the following as a Lease Stipulation and a Condition of Approval for Applications for Permit to Drill:
  - All new and replacement internal combustion gas field engines of less than or equal to 300 design-rated horsepower must not emit more than 2 gms of NOx per horsepower-hour. This requirement does not apply to gas field engines of less than or equal to 40 design-rated horsepower.
  - All new and replacement internal combustion gas field engines of greater than 300 design rated horsepower must not emit more than 1.0 gms of NOx per horsepower-hour.

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Area closed to leasing: 459,700 acres	Area closed to leasing: 446,900 acres	Area closed to leasing: 447,300 acres	Area closed to leasing: 586,300 acres	Area closed to leasing: 1,160,500 acres
Manage fluid mineral leases as shown on Map 2-35: • Areas open to leasing with standard lease terms: 1,236,500 acres • Areas open to leasing subject to CSU and/or timing limitations: 409,200 acres • Areas open to leasing subject to NSO: 22,600 acres	Manage fluid mineral leases as shown on Map 2-36: • Areas open to leasing with standard lease terms: 860,600 acres • Areas open to leasing subject to CSU and/or timing limitations: 820,500 acres • Areas open to leasing subject to NSO: 0 acres	Manage fluid mineral leases as shown on Map 2-37: • Areas open to leasing with standard lease terms: 608,700 acres • Areas open to leasing subject to CSU and/or timing limitations: 917,500 acres • Areas open to leasing subject to NSO: 154,500 acres	Manage fluid mineral leases as shown on Map 2-38: • Areas open to leasing with standard lease terms: 491,900 acres • Areas open to leasing subject to CSU and/or timing limitations: 901,100 acres • Areas open to leasing subject to NSO: 148,700 acres	Manage fluid mineral leases as shown on Map 2-39: • Areas open to leasing with standard lease terms: 290,200 acres • Areas open to leasing subject to CSU and/or timing limitations: 634,000 acres • Areas open to leasing subject to NSO: 43,300 acres
Issue: Management of Geophysical Operations				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Geophysical operations are subject to the oil and gas leasing categories.	Subject geophysical operations under 43 CFR 3150 to the oil and gas leasing restrictions with the following exception: • Consider geophysical operations proposed for lands that are designated as NSO or closed to leasing for approval when (1) the circumstances or relative resource values in the area have changed, (2) less restrictive requirements could be developed to protect the resource of concern, or (3) operations could be conducted without causing unacceptable impacts to the resource of concern.			

Table 2-18. Minerals and Energy Decisions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Issue: Management of Geothermal Resources				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Lease split-estate lands according to BLM RMP stipulations for adjacent or nearby public lands or plans of other surface management agencies, consistent with federal laws, 43 CFR 3101, and the surface owner's rights.				
Continue to allow geothermal leasing on a case-by-case basis. Use the oil and gas leasing designations as a guide for geothermal resources.	• Lease geothermal resources in conformance with the oil and gas leasing restrictions (open, open with moderate constraints, open with major constraints, and closed) for oil and gas leasing, consistent with the authorities granted at 43 CFR 3200, including 3201 and 3250. • Note: exploration operations under 43 CFR 3250 proposed for lands that are designated as NSO or closed to leasing may be considered for approval when (1) the circumstances or relative resource values in the area have changed, (2) less restrictive requirements could be developed to protect the resource of concern or (3) operations could be conducted without causing unacceptable impacts to the resource or concern.			
Issue: Management of Tar Sands Areas				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Areas available for future consideration for tar sands leasing will be identified in the ROD for the *National Oil Shale and Tar Sands Programmatic EIS,* being conducted by BLM separately from this analysis. If lands are identified, future leasing considerations will be conducted under site-specific NEPA analyses, and would be subject to the oil and gas leasing restrictions identified in the Proposed RMP and DRMP/DEIS Alternatives.				
Issue: Surface Mining of Coal				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Consider leasing coal resources on the following lands identified in the existing LUPs as acceptable: • 25,446 acres of federal mineral estate in the Henry Mountains are identified as acceptable for consideration of coal leasing by surface mining methods.	• Consider applications for exploration licenses for lands that are subject to leasing as defined at 43 CFR 3400.2. Licenses would be subject to the surface disturbing restrictions and the provisions for exceptions, modifications, and waivers, similar to the oil and gas restrictions consistent with the regulations at 43 CFR 3400. • Consider proposals for coal leasing on public lands determined to be acceptable for further consideration for leasing in the coal unsuitability analysis (Appendix 8), if and when there is interest. Prior to leasing, complete a multiple use analysis (43 CFR 3420.1 (3)), consult with other surface owners (43 CFR 3420.1-5 (4) (i)), and address other applicable requirements of 43 CFR 3400 Coal Management. – In the Henry Mountains coal field, 14,719 acres are acceptable for consideration for leasing by surface mining methods. – In the Wasatch Plateau and Emery coal fields, 0 acres are acceptable for consideration for leasing by surface mining			

Table 2-18. Minerals and Energy Decisions

• 30,052 acres of federal mineral estate in the Wasatch Plateau and Emery coal fields are identified as acceptable for consideration of coal leasing by surface mining methods.	methods.			
Consider no coal leasing proposals in VRM Class I areas. VRM Classes II, III, and IV areas would be subject to coal exploration and development mitigation requirements, with VRM Class II being most restrictive and VRM Class IV least restrictive.	• Consider no coal leasing proposals in VRM Class I areas. VRM Classes II, III, and IV areas would be subject to coal exploration and development mitigation requirements, with VRM Class II being most restrictive and VRM Class IV least restrictive. • Consider no coal leasing proposals in the 12 (78,600 acres) identified non-WSA lands with wilderness characteristics.	Consider no coal leasing proposals in VRM Class I or II areas.	• Consider no coal leasing proposals in VRM Class I or II areas. • Consider no coal leasing proposals in non-WSA lands with wilderness characteristics (682,600 acres).	
Issue: Subsurface Mining of Coal				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Consider leasing coal resources on the following lands currently identified as acceptable: • 107,414 acres of federal mineral estate	• Consider applications for exploration licenses for lands that are subject to leasing as defined at 43 CFR 3400.2. Licenses would be subject to the surface disturbing restrictions and the provisions for exceptions, modifications, and waivers, similar to the oil and gas restrictions consistent with the regulations at 43 CFR 3400. • Consider proposals for coal leasing on public lands determined to be acceptable for further consideration for leasing in the coal unsuitability analysis (Appendix 8), if and when there is interest. Prior to leasing, complete a multiple use analysis (43 CFR 3420.1 (3)), consult with other surface owners (43 CFR 3420.1-5 (4) (i)), and address other applicable			

Table 2-18. Minerals and Energy Decisions

in the Henry Mountains are identified as acceptable for consideration of leasing by underground mining with 19,255 acres subject to no surface facilities. • 73,952 acres of federal mineral estate in the Wasatch Plateau and Emery coal fields are identified as acceptable for consideration of leasing with 43,567 acres subject to no surface facilities.	requirements of 43 CFR 3400 Coal Management. – In the Henry Mountains coal field, 41,842 acres of BLM lands are acceptable for consideration for leasing by underground mining methods. – In the Wasatch Plateau coal field, 18,672 acres of National Forest, and in the Emery coal field, 9,624 acres of BLM lands and 3,542 acres of National Forest are acceptable for consideration for leasing by underground mining methods.			
Consider no coal leasing proposals in VRM Class I areas. VRM Class II, III, and IV areas would be subject to coal exploration and development mitigation requirements, with VRM Class II being most restrictive and VRM IV least restrictive.			Consider no coal leasing proposals in VRM Class I or II areas.	• Consider no coal leasing proposals in VRM Class I or II areas. • Consider no coal leasing proposals in non-WSA lands with wilderness characteristics.
Issue: Management of Non-Energy Solid Leasable Minerals				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Mineral use authorizations for non-energy solid leasable minerals include: prospecting permits, exploration licenses, preference right leases, competitive leases, fringe acreage leases, lease modifications, and use permits. As used herein, the term *leasing* is used to refer to any of the mineral use authorizations, because if the area is not open to leasing, then an exploration authorization or lease modification would not be considered. Any mineral use authorization issued after the RMP is approved would be subject to the stipulations developed in the RMP. The open and closed areas for leasing of non-energy solid leasable minerals would be the same as provided for oil and gas leasing, including exceptions, modifications, and waivers.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Continue to prohibit leasing in WSAs, within	• Manage leasing as	• Manage leasing as	• Manage leasing as	• Manage leasing as

Table 2-18. Minerals and Energy Decisions

one-quarter mile of eligible wild and scenic rivers, and within ACECs. • Allow leasing where it is consistent with the existing LUPs and has been addressed in a NEPA analysis.	shown on Map 2-40. • Areas closed to leasing (WSAs): – 446,900 acres • Areas open to leasing subject to standard conditions of approval: – 860,600 acres • Areas open to leasing subject to CSU and/or timing limitations: – 820,500 acres • Areas open to leasing subject to NSO: – 0 acres	shown on Map 2-41. • Closed to leasing in WSAs and, within one-quarter mile of the high water mark on each bank of the Fremont Gorge WSR recommended as suitable. • Areas closed to leasing: – 447,300 acres • Areas open to leasing subject to standard conditions of approval: – 608,700 acres • Areas open to leasing subject to CSU and/or timing limitations: – 917,500 acres • Areas open to leasing subject to NSO: – 154,500 acres	shown on Map 2-42. • Closed to leasing in WSAs, within one-quarter mile of the 12 WSRs recommended as suitable, and within the following ACECs: – Dirty Devil/North Wash ACEC – Fremont Gorge/ Cockscomb ACEC – Badlands ACEC – Henry Mountains ACEC – Horseshoe Canyon ACEC – Little Rockies ACEC – Rainbow Hills ACEC • Areas closed to leasing: – 586,300 acres • Areas open to leasing subject to standard conditions of approval: – 491,900 acres • Areas open to leasing subject to CSU and/or timing limitations: – 901,100 acres • Areas open to leasing subject to NSO: – 148,700 acres	shown on Map 2-43. • Closed to leasing in WSAs, non-WSA lands with wilderness characteristics, within one-quarter mile of the 12 WSRs recommended as suitable, and within the following ACECs: – Dirty Devil/North Wash ACEC – Fremont Gorge/ Cockscomb ACEC – Badlands ACEC – Henry Mountains ACEC – Horseshoe Canyon ACEC – Little Rockies ACEC – Rainbow Hills ACEC • Areas closed to leasing: – 1,160,500 acres • Areas open to leasing subject to standard conditions of approval: – 290,200 acres • Areas open to leasing subject to CSU and/or timing limitations: – 634,000 acres • Areas open to leasing subject to NSO: – 43,300 acres

Table 2-18. Minerals and Energy Decisions

Issue: Management of Locatable Minerals				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Continue to make existing operations subject to the stipulations developed for the notice or plan of operations. The BLM would evaluate all operations authorized by the mining laws in the context of its requirement to prevent unnecessary and undue degradation of federal lands and resources and the non-impairment standards of the federal regulations at 43 CFR 3802 and the IMP for WSAs. Consistent with the rights afforded claimants under the mining laws, operations conducted after the RMP is approved would be required to conform to the stipulations developed in the RMP and as generally provided in the oil and gas stipulations. The oil and gas stipulations would be a general guideline and may not apply uniformly to all operations under the mining laws. Operations on BLM-administered lands open to mineral entry must be conducted in compliance with all of the BLM's surface management regulations The BLM surface management regulations apply to public lands, including split estate lands where the minerals are reserved to the United States, but the regulations do not apply to surface lands managed by other federal agencies. All public lands with federal mineral estate are open to mining claim location unless specifically withdrawn from mineral entry by Secretarial order or by a public land law. Therefore, other than the existing withdrawals and those recommended by this RMP, all public lands within the RFO remain open to mineral entry under the mining laws. The BLM may recommend future withdrawals in areas identified as closed or with a NSO stipulation for oil and gas leasing, if it becomes necessary to prevent unacceptable resource impacts.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Continue to allow location, exploration, and development of locatable minerals while preventing unnecessary and undue degradation of other resources and preventing impairment to wilderness suitability of WSAs. • Continue existing withdrawals (154,700 acres). Recommend withdrawing four existing ACECs (14,780 acres) from mineral entry. Total acres: 169,480	• Allow location, exploration, and development of locatable minerals while preventing unnecessary and undue degradation of other resources and preventing impairment to wilderness suitability of WSAs. • Continue existing withdrawals (154,700 acres). Total acres: 154,700	• Allow location, exploration, and development of locatable minerals on public lands while preventing unnecessary and undue degradation of other resources and preventing impairment to wilderness suitability of WSAs. • Continue existing withdrawals (154,700 acres). Recommend withdrawing the following areas from mineral entry: – Developed recreation sites, including Lonesome Beaver Campground,	• Allow location, exploration, and development of locatable minerals on public lands while preventing unnecessary and undue degradation of other resources and preventing impairment to wilderness suitability of WSAs. • Continue existing withdrawals (154,700 acres). Recommend withdrawing the following areas from mineral entry: – Developed recreation sites, including Lonesome Beaver Campground,	• Allow location, exploration, and development of locatable minerals on public lands while preventing unnecessary and undue degradation of other resources and preventing impairment to wilderness suitability of WSAs. • Continue existing withdrawals (154,700 acres). Recommend withdrawing the following areas from mineral entry: – Developed recreation sites, including Lonesome Beaver Campground,

Table 2-18. Minerals and Energy Decisions

		McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area – North Caineville Mesa ACEC – Old Woman Front ACEC – Fremont Gorge Suitable WSR (within one-quarter mile of the high water mark of each bank of the river). The proposed new withdrawals would encompass 21,500 acres. Total acres: 176,200	McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area – Dirty Devil/North Wash ACEC (VRM Class II area) – Fremont Gorge/ Cockscomb ACEC (VRM Class II area) – Badlands ACEC (VRM Class II area) – Henry Mountains ACEC (VRM Class II area) – Horseshoe Canyon ACEC (VRM Class II area) – Little Rockies ACEC (VRM Class II area) – Rainbow Hills ACEC – All suitable WSRs within a one-quarter mile corridor along each side of the river. The proposed new withdrawals would encompass 176,400 acres. Total acres: 331,100	McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area – Dirty Devil/North Wash ACEC (VRM Class II area) – Fremont Gorge/ Cockscomb ACEC (VRM Class II area) – Badlands ACEC (VRM Class II area) – Henry Mountains ACEC (VRM Class II area) – Horseshoe Canyon ACEC (VRM Class II area) – Little Rockies ACEC (VRM Class II area) – Rainbow Hills ACEC – All suitable WSRs within a one-quarter mile corridor along each side of the river – All non-WSA lands with wilderness characteristics. The proposed new withdrawals would

Table 2-18. Minerals and Energy Decisions

				encompass 749,200 acres. Total acres: 903,900
Issue: Management of Salable Minerals (Mineral Materials)				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Authorizations for mineral materials include: exploration permits, exclusive sale contracts, free use permits, community pits, and common use areas. As used herein, the term *disposal* is used as inclusive of any mineral material authorization, because exploration permits would not be issued in areas closed to disposals. Existing disposals would continue to be subject to the existing stipulations and conditions for that disposal. Disposals issued or designated after the RMP is approved would be subject to the stipulations developed in the RMP. The open and closed areas for mineral material disposals would be the same as provided for oil and gas leasing, including exceptions, modifications, and waivers.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue to prohibit disposal of mineral materials in WSAs, within one-quarter mile of eligible WSRs, and ACECs. Allow mineral material disposals on a case-by-case basis subject to site-specific environmental analysis outside of these areas.	• Manage disposal of mineral materials as shown on Map 2-40. • Areas closed to mineral material disposals (WSAs): – 446,900 acres • Areas open to disposal of mineral materials subject to standard conditions of approval: – 860,600 acres • Areas open to disposal of mineral materials subject to CSU and/or timing limitations: – 820,500 acres • Areas open to disposal of mineral materials subject to NSO: – 0 acres	• Manage disposal of mineral materials as shown on Map 2-41. • Allow no disposal of mineral materials in WSAs, non-WSA lands with wilderness characteristics, and within one-quarter mile of the high water mark on each bank of the Fremont Gorge suitable WSR. • Areas closed to mineral material disposals: – 601,800 acres • Areas open to disposal of mineral materials subject to standard conditions of approval: – 608,700 acres • Areas open to disposal of mineral materials subject to CSU and/or	• Manage disposal of mineral materials as shown on Map 2-42. • Allow no disposal of mineral materials in WSAs, within one-quarter mile of suitable WSRs, and within the following ACECs: – Dirty Devil/North Wash ACEC – Fremont Gorge/ Cockscomb ACEC – Badlands ACEC – Henry Mountains ACEC – Horseshoe Canyon ACEC – Little Rockies ACEC – Rainbow Hills ACEC • Areas closed to mineral material disposals: – 586,300 acres • Areas open to disposal	• Manage disposal of mineral materials as shown on Map 2-43. • Allow no disposal of mineral materials in WSAs, non-WSA lands with wilderness characteristics, within one-quarter mile of suitable WSRs, and within the following ACECs: – Dirty Devil/North Wash ACEC – Fremont Gorge/ Cockscomb ACEC – Badlands ACEC – Henry Mountains ACEC – Horseshoe Canyon ACEC – Little Rockies ACEC – Rainbow Hills ACEC • Areas closed to mineral

		timing limitations: – 917,500 acres	of mineral materials subject to standard conditions of approval: – 491,900 acres • Areas open to disposal of mineral materials subject to CSU and/or timing limitations: – 901,100 acres • Areas open to disposal of mineral materials subject to NSO: – 148,700 acres	material disposals: – 1,160,500 acres • Areas open to disposal of mineral materials subject to standard conditions of approval: – 290,200 acres • Areas open to disposal of mineral materials subject to CSU and/or timing limitations: – 634,000 acres • Areas open to disposal of mineral materials subject to NSO: – 43,300 acres

2.6.3 Special Designations

Wilderness Study Areas

Table 2-19. Wilderness Study Areas Decisions

Desired Outcomes (Goals and Objectives)				
Continue to manage WSAs in a manner that does not impair their suitability for designation as wilderness in accordance with FLPMA Section 603 and the *Interim Management Policy for Lands Under Wilderness Review*.				
Issue: Interim Management of Wilderness Study Areas				
Management Action				
Common to the Proposed RMP and Draft RMP Alternatives				
Manage WSAs according to the IMP (BLM-H-8550-1). The BLM is statutorily (FLPMA Section 603(c)) required to manage these areas to protect their suitability for congressional designation to the National Wilderness Preservation System unless and until Congress either designates an area as wilderness or releases it from further consideration. The BLM's discretion to make planning decisions on management of WSAs is limited to designating WSAs as VRM Class I and determining whether the WSAs will be limited or closed to OHV use.				
Issue: Oil and Gas Leasing in WSAs				
Management Action				
Common to the Proposed RMP and Draft RMP Alternatives				
Close all WSAs to leasing pursuant to the Federal Onshore Oil and Gas Leasing Reform Act of 1987.				
Issue: Visual Resource Management and Designation in WSAs				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Manage WSAs as VRM Class I.	Designate all WSAs as VRM Class I.			
Issue: Off-Highway Vehicle Area and Route Designation in WSAs				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
Where routes would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs – see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or non-compliance are found through monitoring efforts to impair the area's suitability for wilderness designation, BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and non-impairment of wilderness values.				

Table 2-19. Wilderness Study Areas Decisions

Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Continue managing WSAs as closed or limited for OHV use as identified in existing LUPs and shown on Map 2-12.	Designate WSAs as limited for OHV use as shown on Map 2-13. A total of 51.6 miles of inventoried vehicle ways would be designated for use subject to the IMP (Table 2-16, Travel Management). Where routes would remain available for motorized use within WSAs, allow such use to continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs) could continue as long as the use of these routes did not impair wilderness suitability, as provided by the BLM Handbook 8550 (*Interim Management for Lands Under Wilderness Review*). If the Congress designates the area as wilderness, the routes would be closed. In the interim, if use and/or non-compliance were found through monitoring efforts to impair the area's suitability for wilderness designation, BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and non-impairment of wilderness values.	Designate the following WSAs as closed for OHV use (as shown on Map 2-14): • Little Rockies (40,700 acres) • Dirty Devil (70,500 acres) • Fiddler Butte (2,200 acres), • Fremont Gorge (2,800 acres), • French Spring/Happy Canyon (11,400 acres) • Horseshoe Canyon North (500 acres) • Horseshoe Canyon South (7,500 acres) • Mount Ellen/Blue Hills (39,700 acres) Designate the following WSAs as limited to OHV use (as shown on Map 2-14): • Bull Mountain (13,200 acres) • Mount Hillers (19,300 acres) • Mount Pennell (77,100 acres) • Dirty Devil (1,600 acres) • Fiddler Butte (71,800 acres) • Fremont Gorge (16 acres) • French Spring/Happy Canyon (12,900 acres) • Horseshoe Canyon North (1,600 acres) • Horseshoe Canyon South	Close WSAs to OHV use as shown on Map 2-15.	Close WSAs to OHV use as shown on Map 2-16.

Table 2-19. Wilderness Study Areas Decisions

		(32,400 acres) • Mount Ellen/Blue Hills (41,700 acres) *A total of 44.0 miles of inventoried vehicle ways would be designated for use subject to the IMP (*Table 2-16*).* *Implementation level decision. • Bull Mountain: 2.8 miles • Dirty Devil: 6.8 miles • Fiddler Butte: 4.1 miles • Fremont Gorge: 0.2 miles • French Spring/Happy Canyon: 3.6 miles • Horseshoe Canyon South: 5.6 miles • Little Rockies: 0.8 miles • Mount Ellen/Blue Hills: 8.7 miles • Mount Hillers: 5.0 miles • Mount Pennel: 6.4 miles		
Issue: Wilderness Study Areas if Released by Congress				
Management Action				
Common to the Proposed RMP and Draft RMP Alternatives				
Only Congress can release a WSA from wilderness consideration. Should any WSA, in part or in whole, be released from wilderness consideration, examine proposals in the released area on a case-by-case basis for consistency with the goals and objectives of the RMP decisions. Actions inconsistent with RMP goals and objectives would be deferred until completion of requisite plan amendments. Because the management direction of the released land would continue in accordance with the goals and objectives established in the RMP, no separate analysis is required in this LUP to address resource impacts if any WSAs are released by Congress.				

* *This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.*

Wild and Scenic Rivers

Table 2-20. Wild and Scenic Rivers Decisions

Desired Outcomes (Goals and Objectives)				
Manage to protect the outstandingly remarkable values, tentative classifications, and free-flowing nature of eligible/suitable river segments.				
Issue: Determination of Suitability of Eligible Wild and Scenic River Segments				
Management Actions				
Common to the Proposed RMP and Draft RMP Alternatives				
BLM would work with the State of Utah, local and tribal governments, and other federal agencies, in a state-wide study, to reach consensus regarding recommendations to Congress for the inclusion of rivers in the National Wild and Scenic Rivers System. Besides applying consistent criteria across agency jurisdictions, the joint study would avoid piece-mealing of river segments in logical watershed units in the state. The study would evaluate, in detail, the possible benefits and effects of designation on the local and state economies, agricultural and industrial operations and interests, outdoor recreation, natural resources (including the outstandingly remarkable values for which the river was deemed suitable), water rights, water quality, water resource planning, and access to and across river corridors within, and upstream and downstream from the proposed segments(s). Actual designation of river segments would only occur through congressional action or as a result of Secretarial decision at the request of the Governor in accordance with provisions of the Wild and Scenic Rivers Act (the Act). BLM will work with the State, local and tribal governments, and the agencies involved to coordinate its decision making on wild and scenic river issues and to achieve consistency wherever possible. BLM recognizes that water resources on most river and stream segments within the State of Utah are already fully allocated. Before stream segments that have been recommended as suitable under this Proposed RMP are recommended to Congress for designation, BLM will continue to work with affected local, state, federal, and tribal partners to identify in-stream flows necessary to meet critical resource needs, including values related to the subject segments(s). Such quantifications would be included in any recommendation for designation. BLM would then seek to jointly promote innovative strategies, community-based planning, and voluntary agreements with water users, under State law, to address those needs. Should designations occur on any river segment as a result of Secretarial or congressional action, existing rights, privileges, and contracts would be protected. Under Section 12 of the Act, termination of such rights, privileges, and contracts may happen only with the consent of the affected non-federal party. A determination by the BLM of eligibility and suitability for the inclusion of rivers on public lands to the Wild and Scenic Rivers System does not create new water rights for the BLM. Federal reserved water rights for new components of the Wild and Scenic Rivers System are established at the discretion of Congress. If water is reserved by Congress when a river component is added to the Wild and Scenic Rivers System, it would come from water that is not appropriated at the time of designation, in the amount necessary to protect features which led to the river's inclusion into the system. BLM's intent would be to leave existing water rights undisturbed and to recognize the lawful rights of private, municipal, and state entities to manage water resources under state law to meet the needs of the community. Federal law, including Section 13 of the Act and the McCarren Amendment (43 U.S.C. 666), recognizes state jurisdiction over water allocation in designated streams. Thus, it is BLM's position that existing water rights, including flows apportioned to the State of Utah interstate agreements and compacts, including the Upper Colorado River Compact, and developments of such rights would not be affected by designation or the creation of the possible federal reserved water right. BLM would seek to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values for which affected river segments were designated.				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Existing LUPs contain no decisions regarding	• Recommend no eligible river segments as	Recommend and manage the following eligible river as	Recommend and manage all of the eligible rivers as suitable for inclusion in the National Wild and Scenic River System:	

Table 2-20. Wild and Scenic Rivers Decisions

WSRs. • As directed by BLM Instruction Memorandum IM-2004-196, Clarification of Policy in the BLM Manual Section 8351, Wild and Scenic Rivers, with Respect to Eligibility Criteria and Protective Management, manage all of the eligible river segments (135 miles) to protect their outstandingly remarkable values, free-flowing nature, and tentative classification, as follows: – 126.4 miles of river segments tentatively classified as "wild" – 3.25 miles of river segments tentatively classified as "scenic" – 5.4 miles of river segments tentatively classified as "recreational" • In accordance with BLM Manual 8351, make no suitability determinations for any of the eligible river segments. They would remain eligible and would be managed to protect their	suitable for inclusion in the National Wild and Scenic River System. • Provide no special management for outstandingly remarkable values.	suitable for inclusion in the National Wild and Scenic River System: • Fremont River in Fremont Gorge with a tentative classification as "wild" (5 miles)	• Dirty Devil River (54 miles)* • Beaver Wash Canyon (6.8 miles)* • Larry Canyon (4 miles)* • No Man's Canyon (7.1 miles)* • Robbers Roost Canyon (31 miles)* • Sams Mesa Box Canyon (9.5 miles)* • Twin Corral Box Canyon (9 miles)* • Fish Creek (0.25 mile) • Fremont River – Fremont Gorge (5 miles) – Below Capitol Reef National Park to Caineville Ditch Diversion (4 miles) • Maidenwater Creek (3 miles) • Quitchupah Creek (1.4 miles). *All or portions of these eligible WSRs overlay WSAs that are managed pursuant to the IMP.

Manage to protect the outstandingly remarkable values, including cultural. Specific management prescriptions within one-quarter mile of the river include: • Close to oil and gas leasing • Close to OHV use • Recommend withdrawing from mineral entry.	

Areas of Critical Environmental Concern

Table 2-21. Areas of Critical Environmental Concern Decisions

Desired Outcomes (Goals and Objectives)				
Manage ACECs with special management attention to protect and prevent irreparable damage to important historic, cultural, or scenic values; fish, wildlife, and plant resources, or other natural system or processes; or to protect life and safety from natural hazards.				
Issue: Designation and Management of Areas of Critical Environmental Concern				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue designation and management of four existing ACECs (Map 3-16): • North Caineville Mesa (2,200 acres) • South Caineville Mesa (4,100 acres)* • Gilbert Badlands (3,680 acres)* • Beaver Wash Canyon (4,800 acres)* Total acres: 14,780 *All or portions of these potential ACECs overlay WSAs, which are managed pursuant to the IMP.	Designate no ACECs.	Designate and manage the following areas as ACECs (Map 2-45): • North Caineville Mesa (2,200 acres) • Old Woman Front (330 acres) Total acres: 2,530	Designate and manage the following areas as ACECs (Map 2-46): • Badlands (includes existing North and South Caineville Mesas and Gilbert Badlands ACECs, 88,900 acres)* • Bull Creek Archaeological District (4,800 acres) • Dirty Devil (includes Beaver Wash Canyon ACEC, 205,300 acres)* • Fremont Gorge/Cockscomb (34,300 acres)* • Henry Mountains (includes No Man's Mesa Potential ACEC, 288,200 acres)* • Horseshoe Canyon (Richfield RFO portion only, 40,900 acres)* • Kingston Canyon (22,100 acres) • Little Rockies (49,200 acres)* • Lower Muddy Creek (Richfield RFO only, 16,200 acres) • Old Woman Front (330 acres) • Parker Mountain (107,900 acres) • Quitchupah (180 acres) • Rainbow Hills (4,000 acres) • Sevier Canyon (8,900 acres) • Thousand Lakes Bench (500 acres) • SSS (15,100 acres)* Total acres: 886,810	

Table 2-21. Areas of Critical Environmental Concern Decisions

			*All or portions of these potential ACECs overlay WSAs, which are managed pursuant to the IMP.	
Issue: Designation and Management of North Caineville Mesa ACEC (2,200 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue designation of the North Caineville Mesa ACEC (Map 3-16). Manage to protect the relevant and important relict vegetation values: • Allow no uses that would cause irreparable damage to relevant and important values • Close to OHV use • Manage as closed to oil and gas leasing • Designate as unavailable for livestock grazing • Identify area as withdrawn from consideration for leasing for surface coal mining • Acquire inholdings within ACEC • Consider withdrawing from mineral entry.	• Do not designate the North Caineville Mesa ACEC. • Manage the North Caineville Mesa area in the manner identified under other resource headings for Alternative A.	Continue designation of the North Caineville Mesa ACEC (Map 2-45). Manage to protect the relevant and important relict vegetation values: • Allow no uses that would cause irreparable damage to relevant and important values • Close to OHV use • Manage as open to oil and gas leasing with major constraints (NSO) • Designate as unavailable for livestock grazing • Identify area as unsuitable for surface coal mining • Acquire inholdings within ACEC • Recommend withdrawing from mineral entry.	Manage the North Caineville Mesa area as part of the Badlands ACEC. (See the Badlands ACEC for special management prescriptions.)	

Table 2-21. Areas of Critical Environmental Concern Decisions

Issue: Designation and Management of South Caineville Mesa ACEC (4,100 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue designation of the South Caineville Mesa ACEC (Map 3-16). Manage the area to protect the relevant and important values: • Allow no uses that would cause irreparable damage to relevant and important values • Close to OHV use • Manage as open to oil and gas leasing with major constraints (NSO) • Unavailable for livestock grazing • Identify area as withdrawn from consideration for leasing for surface coal mining • Nominate cabin on South Caineville Mesa to NRHP • Increase public awareness of cultural resources, increase law enforcement presence, and if necessary, fence or otherwise directly protect important sites,	• Do not designate the South Caineville Mesa ACEC. • Manage the South Caineville Mesa area in the manner identified under other resource headings for Alternative A.	• Do not designate the South Caineville Mesa ACEC. • Manage the South Caineville Mesa area in the manner identified under other resource headings for The Proposed RMP.	Manage the South Caineville Mesa area as part of the Badlands ACEC. (See the Badlands ACEC for special management prescriptions.)	

Table 2-21. Areas of Critical Environmental Concern Decisions

and maintain stability of cabin on South Caineville Mesa • Consider withdrawal from mineral entry if area is released from wilderness consideration.				
Issue: Designation and Management of Beaver Wash Canyon ACEC (4,800 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue Beaver Wash Canyon ACEC designation, to be managed for protection of relevant and important ecologic (riparian) values (Map 3-16). Manage Beaver Wash with the following special management to protect the relevant and important values from irreparable damage: • Close to OHV use • Close to oil and gas leasing Pursue land tenure adjustment, including acquisition through exchange of all state sections in the area • Designate as unavailable for livestock grazing from south boundary of Section 25 northward • Recommend	• Do not designate the Beaver Wash Canyon ACEC. • Manage the Beaver Wash Canyon area in the manner identified under other resource headings for Alternative A.	• Do not designate the Beaver Wash Canyon ACEC. • Manage the Beaver Wash Canyon area in the manner identified under other resource headings for the Proposed RMP.	Manage the Beaver Wash Canyon area as part of the Dirty Devil ACEC. See Dirty Devil ACEC (below) for special management prescriptions.	

Table 2-21. Areas of Critical Environmental Concern Decisions

withdrawing from mineral entry			

Table 2-21. Areas of Critical Environmental Concern Decisions

Issue: Designation and Management of Gilbert Badlands ACEC (3,680 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue Gilbert Badlands ACEC and RNA designations, to be managed for protection of relevant and important natural systems or processes and in accordance with 43 CFR 8223.1 (Map 3-16). Manage the Gilbert Badlands ACEC with the following special management to protect the relevant and important values from irreparable damage: • Close to OHV use • Manage as closed to oil and gas leasing • Consider withdrawing from mineral entry • Prohibit all surface disturbing activities • Acquire in-holdings within ACEC.	• Do not designate the Gilbert Badlands ACEC or RNA. • Manage the Gilbert Badlands area in the manner identified under other resource headings for Alternative A.	• Do not designate the Gilbert Badlands ACEC or RNA. • Manage the Gilbert Badlands area in the manner identified under other resource headings for the Proposed RMP.	Manage the Gilbert Badlands area as part of the Badlands ACEC. (See the Badlands ACEC for special management prescriptions.)	
Issue: Designation and Management of Potential Badlands ACEC (88,900 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
Continue managing the existing North Caineville, South Caineville, and Gilbert Badlands ACECs to protect their relevant and important values as prescribed above.	• Do not designate the Badlands ACEC or Research Natural Area. • Manage identified under other resource headings	• Do not designate the Badlands ACEC or Research Natural Area. • Manage identified	Designate the Badlands ACEC and RNA, to be managed to protect relevant and important values, including scenic, special status plants, natural processes, and riparian and relict vegetation from irreparable damage (Map 2-46). Special management of the area to protect these values includes:	

Table 2-21. Areas of Critical Environmental Concern Decisions

	for Alternative A.	under other resource headings for the Proposed RMP.	• Allow no uses that would cause irreparable damage to relevant and important values. **Vegetation** • Continue unavailability for grazing on North and South Caineville Mesas to protect relict vegetation. **Cultural Resources** • Increase public awareness of cultural resources, increase law enforcement presence, and if necessary, fence or otherwise directly protect important sites, and maintain stability of cabin on South Caineville Mesa. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. **Visual Resources** • Designate Class A scenery (outside of WSAs and outside of non-WSA lands with wilderness characteristics [Alternative D only]) as VRM Class II, and implement VRM BMPs. **Special Status Species** • Increase law enforcement patrols, educate the public about values of listed cacti, evaluate proposed upstream water developments to determine impacts on fish species, and, based on that evaluation, take appropriate action to protect SSS. **Travel Management** • Close mesa tops to OHV use. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. Limit OHV use to designated routes in the remainder of the ACEC to prevent irreparable damage to cultural resources, badlands topography, listed species of cacti, and scenic values. **Lands and Realty** • Recommend withdrawing the non-WSA lands with wilderness characteristics (Alternative D only) and Class A scenery outside WSA from mineral entry. **Minerals**

Table 2-21. Areas of Critical Environmental Concern Decisions

			• Close to oil and gas leasing.	
Issue: Management of Potential Bull Creek Archaeological ACEC (4,800 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Bull Creek Archaeological District as an ACEC. • Manage the Bull Creek Archaeological District consistent with properties listed on the NRHP.			Designate the Bull Creek Archaeological District as an ACEC for the purpose of protecting relevant and important cultural resource values (Map 2-46). Special management to protect these values from irreparable damage includes: **Cultural Resources** • Increase public awareness of cultural resource values, increase law enforcement presence, and if necessary, install fencing or other direct protection of important sites. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. **Travel Management** • Limit OHV use to designated routes to protect cultural resources from damage. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use.	
Issue: Designation and Management of Potential Dirty Devil/North Wash ACEC (205,300 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Manage Beaver Wash Canyon ACEC (a portion of the potential Dirty Devil ACEC) according to the management prescriptions outlined above for that ACEC. • Manage remainder of the potential Dirty Devil ACEC according to other decisions outlined in the 1982 Henry	• Do not designate the Dirty Devil/North Wash potential ACEC. • Manage the Dirty Devil/North Wash area in the manner identified under other resource headings for Alternative A.	• Do not designate the Dirty Devil/North Wash potential ACEC. • Manage the area included in the Dirty Devil SRMA, according to those prescriptions. Manage areas not included within the Dirty Devil SRMA in the manner identified under other resource headings for	Designate the Dirty Devil/North Wash area as an ACEC for protection of relevant and important values, including scenic, cultural, paleontological, wildlife, and SSS (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Riparian** • Restore, maintain, and improve riparian areas to proper functioning condition (PFC). • Fence riparian areas to exclude livestock. Fencing or	

Table 2-21. Areas of Critical Environmental Concern Decisions

Mountain MFP, as amended.		the Proposed RMP.	other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. • Rehabilitate springs. • Plant willows and cottonwoods. **Fire and Fuels Management** • Allow no prescribed or wildland fire use in Mexican spotted owl core areas and nest protection areas at any time. • Suppress wildfires that threaten Mexican spotted owl core areas and nest protection areas. **Cultural Resources** • Reduce vandalism of cultural resources by increasing public awareness of their value, increasing law enforcement presence and, if necessary, fencing or otherwise directly protecting important sites. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. **Visual Resources** • Designate Class A scenery outside of WSAs (Alternatives C and D) and outside of non-WSA lands with wilderness characteristics (Alternative D) as VRM Class II. • Designate remainder of ACEC (outside of non-WSA lands with wilderness characteristics— Alternative D only) as VRM Class III. • Implement BMPs appropriate to the VRM class to protect scenic values. **Special Status Species** • Manage the Mexican spotted owl in cooperation with USFWS and UDWR. • Restrict motorized access in sensitive plant areas. • Increase law enforcement patrols. **Wildlife**

Table 2-21. Areas of Critical Environmental Concern Decisions

			• Manage Desert bighorn sheep in cooperation with UDWR. • Allow water developments that would benefit Desert bighorn sheep. Water developments would not be allowed in non-WSA lands with wilderness characteristics (Alternative D only). **Livestock grazing** • Permit no domestic sheep grazing to protect bighorn sheep from disease. • Keep Beaver Wash unavailable for grazing to protect riparian values. **Recreation** • Construct no camping facilities in the Mexican spotted owl nest protection core areas or within non-WSA lands with wilderness characteristics (Alternative D only). • Reduce harassment of bighorn sheep and Mexican spotted owls by regulating the number of recreational parties, party size, and season of use. • Limit recreation use through use of permits, if determined necessary to protect relevant and important values. **Travel Management** • Limit OHVs to designated routes to protect scenic values. During management plan development for this ACEC, OHV route designations would be reviewed and revised if necessary (with appropriate NEPA review) to protect scenic values. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. • Discourage recreation use within one-half mile of known Mexican spotted owl nest sites during breeding season (February 1 to August 31). **Lands and Realty** • Avoid authorizing ROWs in VRM Class I or II areas. • Retain ACEC in public ownership. • Acquire inholdings within the ACEC from willing sellers.

Table 2-21. Areas of Critical Environmental Concern Decisions

			• Recommend withdrawing Class A scenery designated as VRM Class II from mineral entry. **Minerals** • Manage VRM Class II areas as open to oil and gas leasing with major constraints, such as NSO. • Close non-WSA lands with wilderness characteristics to oil and gas leasing (Alternative D only). • Manage remainder of ACEC as open to oil and gas leasing subject to controlled surface use and/or timing limitations. • Use BMPs to protect scenic values. • Include seasonal restriction stipulations in lease permits during the Mexican spotted owl breeding season (February 1 to August 31) for all mineral development activities within one-half mile around known nest sites. • Restrict oil and gas exploration and development activities from February 1 through August 31 in Mexican spotted owl nest protection areas.
Issue: Designation and Management of Potential Fremont Gorge/Cockscomb ACEC (34,300 acres)			
Management Actions			
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C** / **Alternative D**
• Do not designate the Fremont Gorge/ Cockscomb ACEC. • Manage the Fremont Gorge/Cockscomb area in accordance with existing LUP.	• Do not designate the Fremont Gorge/ Cockscomb ACEC. • Manage the Fremont Gorge/Cockscomb area in the manner identified under other resource headings for Alternative A.	• Do not designate the Fremont Gorge/ Cockscomb ACEC. • Portions of this area are included in the Capitol Reef Gateway SRMA and the Fremont Gorge Suitable WSR corridor and would be managed according to the prescriptions identified in those sections. Areas not included within the	Designate the Fremont Gorge/Cockscomb area as an ACEC for protection of relevant and important values, including cultural, scenic, riparian, plant, and wildlife (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Riparian** • Evaluate proposed upstream water developments to determine possible adverse impacts on riparian areas. • Limit recreation use in riparian areas, if needed to protect riparian values. **Cultural Resources**

Table 2-21. Areas of Critical Environmental Concern Decisions

		Capitol Reef Gateway SRMA and Fremont Gorge WSR corridor would be managed in the manner identified under other resource headings for the Proposed RMP.	• Reduce vandalism of cultural resources by increasing public awareness of their value, increasing law enforcement presence, and, if necessary, fencing or otherwise directly protecting important sites. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics under Alternative D. **Visual Resources** • Designate Class A scenery outside of WSAs (Alternatives C and D) and outside of non-WSA lands with wilderness characteristics (Alternative D) as VRM Class II. • Designate remainder of ACEC (outside of non-WSA lands with wilderness characteristics— Alternative D only) as VRM Class III. • Implement VRM BMPs appropriate to VRM Class to protect scenic values. **Fire** • Suppress wildfire in crucial mule deer habitat containing browse species. **Recreation** • Limit recreation use in Fish Creek Cove and Beas Lewis Flats to protect cultural resources, if needed. **Travel Management** • Manage OHVs as limited to designated routes to protect scenic values. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. **Lands and Realty** • Maintain crucial mule deer habitat in public ownership. • Recommend withdrawing Class A scenery outside WSA and non-WSA lands with wilderness characteristics (Alternative D only) from mineral entry. **Minerals** • Manage VRM II areas as open to oil and gas leasing with major constraints, such as NSO.

Table 2-21. Areas of Critical Environmental Concern Decisions

			• Manage VRM III areas as open to leasing subject to CSU and/or timing limitations. • Manage VRM Class I areas in non-WSA lands with wilderness characteristics (Alternative D only) as closed to oil and gas leasing.	
Issue: Designation and Management of Proposed Henry Mountains ACEC (288,200 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Henry Mountains ACEC. • Manage the Henry Mountains area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternative A and the Proposed RMP.			Designate the Henry Mountains area as an ACEC for protection of relevant and important values, including wildlife (e.g., bison and deer), SSS (e.g., Townsend's big-eared bat, ferruginous hawk, burrowing owl, hole-in-the-rock prairie clover, Dana's milkvetch, and Barneby milkvetch), scenic, and ecological values (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Riparian** • Restore, maintain, and improve riparian areas to bring them into PFC. Surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics under Alternative D. • Maintain erosion control structures in Nasty Flat area. **Vegetation** • Manage vegetation to benefit mule deer and bison habitat. • Manage No Man's Mesa to protect relict vegetation. **Cultural Resources** • Reduce vandalism of cultural resources by increasing public awareness of their value, increasing law enforcement presence and, if necessary, fencing or otherwise directly protecting important sites. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics under	

Table 2-21. Areas of Critical Environmental Concern Decisions

	Alternative D. • Close Starr Ranch to recreation/interpretation use until stabilization can be accomplished. **Visual Resources** • Designate Class A scenery outside of WSAs (Alternatives C and D) and outside of non-WSA lands with wilderness characteristics (Alternative D) as VRM Class II. • Designate remainder of ACEC as VRM Class III to allow manipulation of habitat to benefit wildlife and mule deer; in all cases, apply appropriate VRM class BMPs. **Special Status Species** • Restrict motorized access in sensitive plant areas. • Increase law enforcement patrols. **Wildlife** • Manage mule deer and bison habitat in cooperation with UDWR. • Allow manipulation of habitat to benefit wildlife. Surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. • Allow range improvements that benefit wildlife. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics under Alternative D. • Develop a Habitat Management Plan for bison and mule deer within the ACEC. **Fire and Fuels Management** • Use appropriate management response to protect and enhance relevant and important values. • Suppress all wildfires near Starr Ranch to protect historical values. **Livestock Grazing** • Change class of livestock on the Pennell Allotment from sheep to cattle.

Table 2-21. Areas of Critical Environmental Concern Decisions

	Recreation • Allow continued maintenance, upgrade, and use of existing campgrounds and picnic facilities within the ACEC at Starr Springs, Lonesome Beaver, McMillan Spring, and Dandelion Flat. Additional recreation facilities may be developed in response to user demand and for resource protection if it would not cause irreparable damage to relevant and important values. **Travel Management** • Limit OHV use in the Nasty Flat area to designated routes. • Limit OHV use to designated routes to protect scenic and cultural resources and bison habitat. During management plan development for this ACEC, OHV route designations would be reviewed and revised if necessary (with appropriate NEPA review) to protect these relevant and important values. • Close No Man's Mesa to OHVs. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. **Lands and Realty** • Authorize no ROWs in VRM Class I and II areas. • Retain ACEC in public ownership. • Acquire inholdings from willing sellers within the ACEC. • Recommend withdrawing No Man's Mesa and areas with Class A scenery designated as VRM Class II from mineral entry. **Minerals** • Manage VRM Class II areas and non-WSA lands with wilderness characteristics (Alternative D only) as closed to oil and gas leasing. • Manage VRM Class III areas as open to oil and gas leasing subject to controlled surface use and/or timing limitations. • Close No Man's Mesa to oil and gas leasing.

Table 2-21. Areas of Critical Environmental Concern Decisions

Issue: Designation and Management of Potential Horseshoe Canyon ACEC (40,900 acres—RFO only)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Horseshoe Canyon ACEC. • Manage the Horseshoe Canyon area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternatives A and the Proposed RMP.			Designate the Horseshoe Canyon area as an ACEC for protection of relevant and important values including scenic, cultural (e.g., Cowboy Cave), riparian, and SSS (e.g., Townsend's big-eared bat) (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Riparian** • Rehabilitate springs to bring them into PFC. • Plant willows and cottonwoods in riparian areas. **Cultural Resources** • Reduce vandalism of cultural resources by increasing public awareness of their value, increasing law enforcement presence and, if necessary, fencing or otherwise directly protecting important sites. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. **Visual Resources** • Designate Class A scenery outside of WSAs (Alternatives C and D) and outside of non-WSA lands with wilderness characteristics (Alternative D) as VRM Class II. **Livestock Grazing** • Fence riparian areas to exclude livestock. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics in Alternative D. **Recreation** • Limit recreation use through use of permits, if needed, to protect sensitive resources.	

Table 2-21. Areas of Critical Environmental Concern Decisions

			Travel Management • Limit OHVs to designated routes to protect scenic, SSSSSS, and cultural values. During management plan development for this ACEC, OHV route designations would be reviewed and revised if necessary (with appropriate NEPA review) to protect these relevant and important values. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. **Lands and Realty** • Authorize no new ROWs in VRM Class I and II areas. • Retain ACEC in public ownership. • Acquire inholdings from willing sellers within the ACEC. • Recommend withdrawing areas with Class A scenery designated as VRM Class II from mineral entry. **Minerals** • Manage VRM Class II areas as open to oil and gas leasing with major constraints, such as NSO. • Manage VRM Class I areas in non-WSA lands with wilderness characteristics (Alternative D only) as closed to oil and gas leasing.
Issue: Designation and Management of Potential Kingston Canyon ACEC (22,100 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Kingston Canyon ACEC. • Manage the Kingston Canyon area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternative A and the Proposed RMP (such as non-WSA lands with wilderness characteristics).			Designate and manage the Kingston Canyon area as an ACEC for protection of relevant and important values including riparian and mule deer habitat (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Fire** • Suppress wildfire in crucial deer winter range. **Travel Management**	

Table 2-21. Areas of Critical Environmental Concern Decisions

			• Limit OHV use to designated routes. • In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. • Limit OHV use with seasonal closures (December 15 through April 15) to protect mule deer habitat. **Lands and Realty** • Acquire in-holdings in the riparian corridor. • Retain the ACEC in public ownership.	
Issue: Designation and Management of Potential Little Rockies ACEC (49,200 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Little Rockies ACEC. • Manage the Little Rockies area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternative A and the Proposed RMP.			Designate the Little Rockies area as an ACEC for protection of relevant and important values, including scenic and wildlife values, notably Desert bighorn sheep and Townsend's big-eared bat, special status plant species, including hole-in-the-rock prairie clover, and ecologic values (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Visual Resources** • Designate Class A scenery outside of WSAs (Alternatives C and D) and outside of non-WSA lands with wilderness characteristics (Alternative D) as VRM Class II. **Wildlife** • Manage Desert bighorn sheep in cooperation with UDWR in accordance with the Henry Mountains Desert Bighorn Habitat Management Plan, as revised. • Continue to cooperate with UDWR in transplants of Desert bighorn sheep into the area consistent with carrying capacity. • Allow range improvements that would benefit Desert bighorn sheep, primarily water developments. Surface	

Table 2-21. Areas of Critical Environmental Concern Decisions

	disturbing activities would not be allowed in non-WSA lands with wilderness characteristics under Alternative D. **Livestock Grazing** • Convert domestic sheep use in Trachyte Allotment to cattle to prevent transmitting disease to Desert bighorn sheep. **Recreation** • Regulate recreation impacts by limiting party size, season of use, and/or location to minimize harassment of Desert bighorn sheep, if needed. • Limit recreation access and party size in Maidenwater and Trachyte canyons to protect ecological values, if needed. **Travel Management** • Limit OHV use to designated routes. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. **Lands and Realty** • Authorize no new ROWs in non-WSA lands with wilderness characteristics (Alternative D only) or in areas with Class A scenery. • Retain ACEC in public ownership. • Acquire inholdings from willing sellers within the ACEC. • Recommend withdrawing Class A scenery designated as VRM Class II from mineral entry. **Minerals** • Manage VRM II areas as open to oil and gas leasing with major constraints, such as NSO. • Close in non-WSA lands with wilderness characteristics (Alternative D only) to oil and gas leasing.

Table 2-21. Areas of Critical Environmental Concern Decisions

Issue: Designation and Management of Potential Lower Muddy Creek ACEC (16,200 acres—RFO portion)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Lower Muddy Creek ACEC. • Manage the Lower Muddy Creek area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternative A and the Proposed RMP.			Designate the Lower Muddy Creek area as an ACEC for protection of relevant and important values, including scenic, riparian, and special status plant (e.g., Wright fishhook and Heil's beavertail cacti) values (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Visual Resources** • Designate Class A scenery outside of WSAs (Alternatives C and D) and outside of non-WSA lands with wilderness characteristics (Alternative D) as VRM Class II. **Special Status Species** • Increase law enforcement patrols to deter illegal cacti collecting. • Increase public education. **Travel Management** • Limit OHVs to designated routes to protect listed plant species. During management plan development for this ACEC, OHV route designations would be reviewed and revised if necessary (with appropriate NEPA review) to protect listed plant species. In Alternative D, close non-WSA lands with wilderness characteristics to OHV use. **Lands and Realty** • Authorize ROWs consistent with VRM Class II objectives. No new ROWs would be authorized in non-WSA lands with wilderness characteristics (Alternative D only). • Retain ACEC in public ownership. • Acquire inholdings within the ACEC from willing sellers.	

Table 2-21. Areas of Critical Environmental Concern Decisions

			Minerals • Close area to oil and gas leasing.	
Issue: Designation and Management of Potential Old Woman Front ACEC (330 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Old Woman Front ACEC and RNA. • Manage the Old Woman Front area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternative A.		Designate the Old Woman Front area as an RNA ACEC for protection of the relevant and important values of relict vegetation. • Coordinate special management for protection of relict vegetation with the USFS Old Woman Cove RNA Plan. • Manage the area for multiple use, while protecting the relict vegetation. **Ecological Processes** • Permit no human activities that directly or indirectly modify ecological processes. **Wildlife** • Allow no wildlife habitat manipulation. • Prohibit the introduction or spread of exotic animal species. **Fire and Fuels Management** • Allow wildland fire use within the parameters of an approved fire plan and only under a prescription designed to accomplish the objectives of the area. • Suppress fires using minimal impact tools and techniques. • Avoid the use of heavy equipment. • Avoid post-fire rehabilitation; if needed, use seed of indigenous species, and locally adapted ecotypes. **Forest Products** • Allow no logging or harvest of woodland products, fuelwood gathering, or Christmas tree cutting. **Livestock Grazing** • Unavailable for livestock grazing. • Construct no range improvements. **Recreation** • Issue no SRPs. **Travel Management**		

Table 2-21. Areas of Critical Environmental Concern Decisions

		• Close area to OHV use. **Facilities** • Authorize no roads, new trails, fences, signs, buildings, or other physical improvements. **Lands and Realty** • Recommend withdrawing from mineral entry. **Minerals** • Manage as open to oil and gas leasing with major constraints, such as NSO.		
Issue: Designation and Management of Potential Parker Mountain ACEC (107,900 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate Parker Mountain ACEC. • Manage the Parker Mountain area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternatives A and the Proposed RMP. Continue to consider ongoing land management practices, vegetative treatments, and grazing regimes, and continue to coordinate management efforts with Parker Mountain Adaptive Resource Management (PARM), BLM, UDWR, USFWS, and Utah State University to address vegetative treatments specific to improving the sagebrush-steppe community.			Designate Parker Mountain area as an ACEC for protection of relevant and important values, including sagebrush-steppe habitat and wildlife values, notably the Greater sage-grouse, Utah prairie dog, and pygmy rabbit (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Vegetation** • Actively manage invasive species. • Evaluate potential vegetation treatments to ensure they are beneficial to sagebrush-steppe habitat and pygmy rabbits, Greater sage-grouse, and Utah prairie dogs. **Wildlife** • Educate hunters on pygmy rabbit identification. **Fire and Fuels Management** • Suppress wild fire in sagebrush-steppe habitat. **Livestock Grazing** • Continue to implement proper grazing management through coordination with PARM. • Base stocking rates on timing and amount of precipitation and the condition of the range.

Table 2-21. Areas of Critical Environmental Concern Decisions

Issue: Designation and Management of Potential Rainbow Hills ACEC (4,000 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Rainbow Hills ACEC. • Manage the Rainbow Hills area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource headings for Alternative A and the Proposed RMP.			Designate the Rainbow Hills area as an ACEC for protection of relevant and important values, including mule deer habitat, natural systems, and SSS, including Utah phacelia, Arapien stickleaf, Ward's penstemon, rainbow rabbitbrush, Sigurd townsendia, and Glenwood milkvetch (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Mule Deer** • Suppress wildfire in crucial mule deer winter range to protect important browse species. **Travel Management** • Close to OHV use. **Lands and Realty** • Retain ACEC in public ownership. • Acquire inholdings from willing sellers. • Avoid granting new ROWs. • Recommend withdrawing from mineral entry. **Minerals** • Allow leasing with NSO to protect special status and endemic plants and the naturally functioning system from major human disturbances.	
Issue: Designation and Management of Potential Sevier Canyon ACEC (8,900 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Sevier Canyon ACEC. • Manage the Sevier Canyon area in accordance with the existing LUP (Alternative N) and in a manner identified under other resource headings for Alternative A and the Proposed			Designate the Sevier Canyon area as an ACEC for protection of relevant and important values, including mule deer habitat, riparian, and SSS values (Map 2-46). Special management for	

Table 2-21. Areas of Critical Environmental Concern Decisions

RMP.			protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Fire and Fuels Management** • Suppress wildfire in crucial mule deer winter range to protect important browse species. **Travel Management** • Limit OHV use to designated routes. • Limit OHVs seasonally (December 15 through April 15) to protect mule deer habitat. **Lands and Realty** • Retain ACEC in public ownership. • Acquire inholdings from willing sellers.	
Issue: Designation and Management of Potential Thousand Lakes Bench ACEC (500 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Thousand Lakes Bench ACEC. • Manage the Thousand Lakes Bench area in accordance with the existing LUP (Alternative N) and in the manner identified under other resource heading for Alternative A and the Proposed RMP.			Designate the Thousand Lakes Bench area as an ACEC for protection of relevant and important values, including cultural resources, special status plants, and riparian areas (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Cultural Resources** • Reduce vandalism of cultural resources by increasing public awareness of their value, increasing law enforcement presence and, if necessary, fencing or otherwise directly protecting important sites. Fencing or other surface disturbing activities would not be allowed in non-WSA lands with wilderness characteristics under Alternative D.	

Table 2-21. Areas of Critical Environmental Concern Decisions

			Special Status Species • Increase law enforcement presence to deter collection of Wright fishhook cactus. **Travel Management** • Limit OHVs to designated routes to protect cultural resources, riparian areas, and special status plants. During management plan development for this ACEC, OHV route designations would be reviewed and revised if necessary (with appropriate NEPA review) to protect these relevant and important values. Under Alternative D, close non-WSA lands with wilderness characteristics to OHV use.	
Issue: Designation and Management of Potential Special Status Species ACEC (15,100 acres)				
Management Actions				
Alternative N (No Action)	**Alternative A**	**Proposed RMP**	**Alternative C**	**Alternative D**
• Do not designate the Special Status Species ACEC. • Manage the Special Status Species ACEC area in accordance with existing LUPs (Alternative N) and in the manner identified under other resource headings for Alternative A and the Proposed RMP. • Manage SSS and their habitats in coordination with the USFWS, UDWR, and other resource management agencies.			Designate the Special Status Species ACEC to protect relevant and important SSS values (Map 2-46). Special management for protection of these values includes: **Prevent Irreparable Damage** • Allow no uses that would cause irreparable damage to relevant and important values. **Vegetation** • Avoid or mitigate impacts to SSS and their habitats when conducting vegetative treatments. **Special Status Species** • Increase law enforcement patrols to deter collecting and poaching. **Recreation** • If monitoring shows that adverse impacts are or could occur to SSS, limit recreation use as necessary. **Travel Management** • Limit OHVs to designated routes in SSS habitat. During management plan development for this ACEC, OHV route designations would be reviewed and revised if	

Table 2-21. Areas of Critical Environmental Concern Decisions

	necessary (with appropriate NEPA review) to protect these SSS. **Lands and Realty** • Retain SSS documented locations in public ownership. • Where determined necessary to acquire important habitat for SSS, pursue acquisition of non-federal lands from willing sellers. • Avoid granting ROWs and other land use authorizations that would affect SSS and their habitats. **Minerals** • Manage SSS areas as open to oil and gas leasing subject to CSU and/or timing limitations. • Manage SSS areas as open to disposal of mineral materials subject to CSU and/or timing limitations.

2.6.4 Transportation

Table 2-22. Transportation Facilities Decisions

Desired Outcomes (Goals and Objectives)
Provide a safe and effective transportation system across public lands.
Issue: Management of Transportation Facilities
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• As per the State of Utah v. Andrus, Oct. 1, 1979 (Cotter Decision), the BLM would grant the State of Utah reasonable access to state lands for economic purposes, on a case-by-case basis. • Continue to support Sanpete, Sevier, Piute, Garfield and Wayne counties and the State of Utah in providing a network of roads for movement of people, goods, and services across public lands. • Review requests for administrative access on a case-by-case basis. • Develop, implement, and maintain cooperative agreements with counties and the State of Utah for maintenance of the transportation system. • Require reclamation of redundant road systems and/or roads that no longer serve their intended purpose in order to reduce road density and reduce habitat fragmentation. • Manage designated scenic byway and backway corridors for the purposes for which they were designated. • Coordinate with the NPS and the State of Utah for management and interpretation of scenic byway and backway corridors. • Install directional, informational, regulatory, and interpretive signs at appropriate locations throughout the planning area. • There are a number of locations throughout the RFO that are commonly known and consistently used for aircraft landing and departure activities that, through such casual use, have evolved into backcountry airstrips (the definition contained in Section 345 of Public Law 106-914, the Interior and Related Agencies Appropriation Act of 2001). In accordance with that law, require full public notice, consultation with local and state government officials, the Federal Aviation Administration (FAA), and compliance with all applicable laws, including NEPA, when considering any closure of an aircraft landing strip.

2.6.5 Health and Safety

Table 2-23. Health and Safety

Desired Outcomes (Goals and Objectives)
• Strive to ensure that human health and safety concerns on public lands remain a major priority. • Mitigate or eliminate all hazardous or potentially hazardous sites and situations, including hazardous materials, hazardous or solid wastes, abandoned mine sites, abandoned well sites, and other potential hazards on public lands. • Minimize or eliminate the potential for intentional or accidental releases of hazardous materials or wastes and solid wastes onto public lands.
Issue: Management of Abandoned Mine Lands
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
In conformance with BLM's long-term strategies and National Policies regarding Abandoned Mine Lands (AML), work with state agencies toward identifying and addressing physical safety and environmental hazards at all AML sites on public lands. To accomplish this long-term goal, establish the following criteria to assist in determining priorities for site and area mitigation and reclamation. Use the following criteria to establish physical safety hazard program priorities: • The highest priority of the AML physical safety program would be cleaning up those AML sites where (a) a death or injury has occurred, (b) the site is situated on or in immediate proximity to developed recreation sites and areas with high visitor use, and (c) upon formal risk assessment, a high or extremely high risk level is indicated. • AML would be factored into future recreation management area designations, land use planning assessments, and all applicable use authorizations. • Sites listed or eligible for listing would be entered in the Abandoned Mine Site Cleanup Module of Protection and Response Information System. • AML hazards should be, to the extent practicable, mitigated or remediated on the ground during site development. The criteria that would be used to establish water-quality based AML program priorities are: • Watersheds identified by the state as a priority based on (a) one or more water laws or regulations; (b) a threat to public health or safety; and (c) a threat to the environment • Projects reflecting a collaborative effort with other land managing agencies • Sites listed or eligible for listing in the Abandoned Mine Site Cleanup Module of the Protection and Response Information System • Projects that would be funded by contributions from collaborating agencies. The State Multi-Year Work Plan would be maintained and updated as needed to reflect current policies for identifying program physical safety and water quality AML sites priorities for reclamation or remediation.

Issue: Management of Hazardous Materials
Management Actions
Common to the Proposed RMP and Draft RMP Alternatives
• Identify and clean up unauthorized dumping sites and hazardous materials spills in the RFO as required to comply with applicable state, local, and federal laws and regulations. • Clean up and restore areas known to have hazardous materials, hazardous wastes, or solid wastes. Areas that have been cleaned up and restored would be maintained and monitored. • Actively seek responsible parties to reimburse hazardous materials cleanup costs.

2.7 IMPACTS SUMMARY TABLE

Table 2-24 provides a summary of impacts that would occur from implementing the five alternatives described in this chapter. Chapter 4 provides more detailed impact analysis.

Table 2-24. Summary Comparison of Impacts

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Air Quality	None of the proposed decisions in Chapter 2 would have a major impact on air quality. Rather, it is more likely that impacts to air quality within the planning area would result from activities on private lands, including growth of cities and towns, increased vehicle traffic on highways and roads, and industrial development (e.g., coal-fired power plants). The public land activity likely to have the greatest impact on air quality would be wildland fire and fuels management, which varies by alternative as shown below.				
	Alternative N's minimal wildland fire use, prescribed fire, and non-fire fuel treatments would minimize smoke and other emissions in the short term but would result in increased fuel build-up, more frequent and larger wildland fires, and greater emissions in the long term.	The types of impacts experienced under these alternatives would be similar to those described for Alternative N except that under Alternatives A and the Proposed RMP. Treatments would average 73,600 acres annually with a maximum acreage limit set over the life of the plan (up to 1,472,000 acres). In contrast with Alternative N, Alternatives A and the Proposed RMP would potentially decrease the level of suppression being used on wildfires through AMR, a strategy to meet Fire Management Unit (FMU) objectives. In the short term, more acres could burn and smoke and particulate emissions could increase. In the long term, the potential for severe and uncontrollable types of wildfires would be predicted to decrease, enabling BLM to manage wildfire and associated emissions more effectively. In the short term, smoke management is a critical component of wildland fire use planning, and it is considered in developing the management response for each wildland fire use event.		The types of impacts experienced under these alternatives would be similar to those described for Alternative A and the Proposed RMP except that under Alternatives C and D, the average annual treatment acres (26,000) and maximum acreage over the life of the plan (520,000) would be less. Similar to Alternative A and the Proposed RMP, Alternatives C and D would potentially decrease the level of suppression being used on wildfires through adoption of AMR (including smoke management considerations). In the short term, relying on prescribed fire as the main fuels management tool would likely increase the acres burned by wildfires and accompanying smoke and particulate emissions compared with Alternative A and the Proposed RMP. In the long term, the potential for severe and uncontrollable types of wildfires may decrease but not as much as under Alternative A and the Proposed RMP because of the limitations on fuels treatments. The consequent impacts to air quality could be greater than under Alternative A and the Proposed RMP but less than under Alternative N.	
Soil Resources	The potential for impacts to soils under Alternative N would be greatest among all the alternatives, due to:	The potential for impacts to soils under Alternative A would be less than under Alternative N but greater than under Alternatives C or D or	The potential for impacts to soils under the Proposed RMP would be less than under Alternatives N or A but greater than under	The potential for impacts to soils under Alternative C would be less than under Alternatives N and A and the Proposed RMP but greater than	The potential for impacts to soils would be least under Alternative D because of limitations on surface disturbing activities resulting from:

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Soil Resources	• Allowing cross-country OHV use on 77 percent of the RFO • Allowing oil and gas leasing on 78 percent of the RFO • Designating 75 percent of the RFO as VRM Classes III or IV.	the Proposed RMP because of the potential for surface disturbing activities resulting from: • Allowing cross-country OHV use on 21 percent of the RFO • Allowing oil and gas leasing on 79 percent of the RFO • Designating 79 percent of the RFO as VRM Classes III or IV • Recommending no ACECs or suitable WSRs.	Alternatives C and D because of limitations on surface disturbing activities resulting from: • Allowing cross-country OHV use on less than 1 percent of the RFO • Closing to leasing or allowing NSO on 28 percent of the RFO • Designating 33 percent of the RFO as VRM Classes I or II • Recommending one eligible WSR segment as suitable.	under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to oil and gas leasing or allowing NSO on 35 percent of the RFO • Designating 32 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 8 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSR segments as suitable.	• Allowing no cross-country OHV use • Closing to oil and gas leasing or allowing NSO on 57 percent of the RFO • Designating 56 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 35 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSR segments as suitable. • Protecting all non-WSA lands with wilderness characteristics.
Water Resources	Surface disturbing activities would be restricted within 500 feet of all waters, limiting damage to riparian vegetation and sedimentation into streams.	Surface disturbing activities would be restricted within the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater, of all waters, which would protect water sources, although less than under Alternatives N, C, or D.		Surface disturbing activities would be restricted within 660 feet of all waters, which would protect water sources more than under Alternatives N and A and the Proposed RMP.	

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	Allowing cross-country OHV use on 77 percent of the RFO and designating 4,315 miles of routes with 539 stream crossings would result in the greatest potential for impacts to water resources.	Allowing cross-country use on 21 percent of the RFO and designating 4,312 miles of routes with 443 stream crossings would have less potential for impacts to water resources than Alternative N, but greater than under the Proposed RMP and Alternatives C and D.	Allowing cross-country OHV use on less than 1 percent of the RFO would reduce potential impacts compared with Alternatives A and the Proposed RMP, and would be similar to impacts under Alternatives C and D. There would be 4,277 miles of designated routes with 400 stream crossings, which would have greater potential for impacts to water resources than under Alternatives C and D.	No cross-country OHV use would be allowed, which would be similar to the Proposed RMP and Alternative D. The potential for impacts to water resources under Alternative C would be less than under Alternatives N and A and the Proposed RMP but greater than under Alternative D because of the designation of 3,192 miles of routes with 273 stream crossings.	As in Alternative C, no cross-country OHV use would be allowed. The potential for impacts to water resources would be least under Alternative D because of the designation of only 3,043 miles of routes with 266 stream crossings.
Vegetation	Managing fire using a full suite of tools would allow for the graduated movement to a more ecologically sustainable condition and reduction of hazardous fuels. Continuing minimal treatments on a case-by-case basis could continue the existing trend of pinyon-juniper woodland encroachment and increase the risk of large or intense wildfires. Vegetation across a large portion of the RFO (77 percent) would continue to be subject to potential impacts from cross-country OHV use.	Adopting an appropriate management response strategy to wildfire would reduce pinyon-juniper woodland encroachment and decrease the risk of large or intense wildfires and their effects on vegetation. Vegetation on 21 percent of the RFO would continue to be subject to potential impacts from cross-country OHV use, less than under Alternative N but more than under the Proposed RMP and Alternatives C and D. Options for managing vegetation would be greatest under Alternative A because it would provide the most tools for managing	Adopting an appropriate management response strategy to wildfire would reduce pinyon-juniper woodland encroachment and decrease the risk of large or intense wildfires (same as under Alternative A). Managing less than 1 percent of the RFO as open for cross-country OHV use could result in the removal of existing vegetation and soil compaction, but on dramatically fewer acres than under Alternatives N and A. Tools for managing vegetation are the same as under Alternative A, but visual resource management and other restrictions	Adopting an appropriate management response strategy to wildfire would reduce pinyon-juniper woodland encroachment and decrease the risk of large or intense wildfires (same as under the Propose RMP and Alternatives A and D). There would be no areas open for cross-country OHV use, eliminating these impacts to vegetation. Alternative C would protect existing vegetation from disturbance because of its restrictions on VRM, OHVs, and vegetation management tools. However, it would provide less flexibility for vegetation management	Adopting an appropriate management response strategy to wildfire would reduce pinyon-juniper woodland encroachment and decrease the risk of large or intense wildfires (same as under Alternative A and C and the Proposed RMP). There would be no areas open for cross-country OHV use, eliminating these impacts to vegetation. Alternative D would best protect existing vegetation from disturbance because of its restrictions on VRM, OHVs, and vegetation management tools. However, it would provide the least flexibility for vegetation

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
		vegetation and the fewest restrictions.	would reduce opportunities for vegetation management in some areas.	than under Alternative N and A and the Proposed RMP because some of these same restrictions could limit the effective management of pinyon-juniper woodland and sagebrush-steppe vegetation communities.	management among the alternatives because some of these same restrictions could limit the effective management of pinyon-juniper woodland and sagebrush-steppe vegetation communities.
Vegetation—Riparian	Surface disturbing activities are the primary cause of adverse impacts to riparian resources. Conversely, proposed decisions to limit surface disturbing activities would help protect riparian resources. Significant impacts to riparian resources would not be anticipated under any of the alternatives. Under all alternatives, actions in riparian areas would be guided by the Utah Riparian Management Policy and the decisions made through this planning effort.				
	Management of riparian and wetland areas would include the avoidance of surface disturbing activities within 500 feet of riparian areas. This would benefit riparian vegetation.	Impacts would be similar to those under Alternative N except that the size of the buffer zone in which no surface disturbance would be allowed is within the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater. Thus, Alternative A and the Proposed RMP would protect a smaller area around the riparian/wetland zones from surface disturbance than under Alternative N. However, projects to improve habitat conditions within these riparian zones could still be performed, even within the buffer zone.		The types of impacts experienced as a result of riparian management would be similar to those described for Alternative N except that the size of the buffer zone in which no surface disturbance would be allowed would be 660 feet on each side of the riparian area. Thus, these alternatives would protect a larger area around the riparian/wetland zones from surface disturbing activities than under Alternatives N or A, or the Proposed RMP.	
	The potential for impacts to riparian resources under Alternative N would be greatest among all the alternatives, due to: • Allowing cross-country OHV use on 77 percent of the RFO • Allowing 539 stream crossings from OHV routes.	The potential for impacts to riparian resources under Alternative A would be less than under Alternative N but greater than the Proposed RMP or Alternatives C or D because of the potential for surface disturbing activities resulting from: • Allowing cross-country OHV use on 21 percent of the RFO • Allowing 443 stream crossings	The potential for impacts to riparian resources under the Proposed RMP would be less than under Alternatives N or A, but greater than under Alternatives C and D because of limitations on surface disturbing activities resulting from: • Allowing cross-country OHV use on less than 1 percent of the RFO • Allowing 400 stream crossings	The potential for impacts to riparian resources under Alternative C would be less than under Alternatives N and A and the Proposed RMP but greater than under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Allowing 273 stream crossings	The potential for impacts to riparian resources would be least under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Allowing 266 stream crossings from OHV routes • Closing to oil and gas leasing or allowing NSO on

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
		from OHV routes • Recommending no ACECs or suitable WSRs.	from OHV routes • Closing to leasing or allowing NSO on 28 percent of the RFO • Designating 33 percent of the RFO as VRM Classes I or II. • Recommending one eligible WSR as suitable • Designating two ACECs (2,530 acres).	from OHV routes • Closing to oil and gas leasing or allowing NSO on 35 percent of the RFO • Designating 32 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 8 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as suitable.	56 percent of the RFO • Designating 56 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 35 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as suitable • Protecting all non-WSA lands with wilderness characteristics.
Vegetation—Invasive, Non-Native Species	Alternatives N, A, and the Proposed RMP would allow a full range of weed control methods (mechanical, biological, manual, fire, and chemical) to be used and would afford the best opportunity for controlling weeds.			Alternatives C and D would preclude the use of mechanical, manual, and chemical methods. Control of some noxious weeds under these alternatives would not be possible in some areas because of lack of suitable substitute treatments, potentially allowing the weeds to spread.	
	Weed seeds are often transported from one place to another on the tires and undercarriages of vehicles. Allowing motorized access into more areas and on more routes would increase the potential for expanding noxious weeds infestations; limiting access decreases the potential.				
	The potential for the spread of weeds by vehicles would be greatest under Alternative N because cross-country OHV use would continue to be	The potential for the spread of weeds by vehicles under Alternative A would be less than under Alternative N but greater than under the Proposed	The potential for the spread of weeds by vehicles under the Proposed RMP would be less than under Alternatives N and A but greater than Alternatives	The potential for the spread of weeds by vehicles under Alternative C would be less than under Alternatives N and A and the Proposed RMP but	The potential for the spread of weeds by vehicles under Alternative D would be least among all alternatives because no cross-country OHV use

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	allowed on 77 percent of the RFO and 10 percent would be closed to OHV use.	RMP or Alternatives C or D because cross-country OHV use would be allowed on 21 percent of the RFO and no areas would be closed to OHV use.	C or D because cross-country OHV use would be allowed on less than 1 percent of the RFO and 10 percent would be closed to OHV use.	greater than Alternative D because no cross-country OHV use would be allowed and 32 percent of the RFO would be closed to OHV use.	would be allowed and 54 percent of the RFO would be closed to OHV use.
Cultural Resources	All permitted activities regulated by BLM are subject to the legal and policy protections and mitigation afforded cultural resources. Unregulated uses that could affect cultural resources include dispersed recreation, and OHV use in areas designated as open. Special designations such as WSAs, ACECs, and WSRs, and decisions to protect, preserve, and maintain the wilderness characteristics associated with non-WSA lands with wilderness characteristics (Proposed RMP and Alternative D) would have a largely beneficial impact on cultural resources because the management prescriptions associated with those designations limit surface disturbing activities.				
	The potential for inadvertent impacts to cultural resources under Alternative N would be greatest among all the alternatives, due to: • Allowing cross-country OHV use on 77 percent of the RFO • Allowing oil and gas leasing on 78 percent of the RFO • Designating 75 percent of the RFO as VRM Classes III or IV.	The potential for inadvertent impacts to cultural resources under Alternative A would be less than under Alternative N but greater than the Proposed RMP or Alternatives C or D because of the potential for surface disturbing activities resulting from: • Allowing cross-country OHV use on 21 percent of the RFO • Allowing oil and gas leasing on 79 percent of the RFO • Designating 79 percent of the RFO as VRM Classes III or IV • Recommending no ACECs or suitable WSRs.	The potential for inadvertent impacts to cultural resources under the Proposed RMP would be less than under Alternatives N or A but greater than Alternatives C and D because of limitations on surface disturbing activities resulting from: • Allowing cross-country OHV use on less than 1 percent of the RFO • Closing to leasing or allowing NSO on 28 percent of the RFO • Designating 33 percent of the RFO as VRM Classes I or II • Recommending one eligible WSR as suitable.	The potential for inadvertent impacts to cultural resources under Alternative C would be less than under Alternatives N and A and the Proposed RMP but greater than under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to leasing or allowing NSO on 35 percent of the RFO • Designating 32 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending	The potential for inadvertent impacts to cultural resources would be least under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to leasing or allowing NSO on 57 percent of the RFO • Designating 56 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 35 percent of the RFO from mineral entry • Designating all

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
				withdrawal of 8 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as suitable.	potential ACECs • Recommending all eligible WSRs as suitable • Protecting, preserving, and maintaining all non-WSA with wilderness characteristics.
Paleontological Resources	All permitted activities regulated by BLM are subject to the legal and policy protections and mitigation afforded paleontological resources. Impacts on paleontological resources occur from natural weathering and erosion, surface disturbing activities, excavation, and theft or vandalism. Unregulated uses that could affect paleontological resources include dispersed recreation, and OHV use in areas designated as open. Special designations, such as WSAs, ACECs, and WSRs, and decisions to protect, preserve, and maintain wilderness characteristics associated with non-WSA lands with wilderness characteristics (Proposed RMP and Alternative D) would have a largely beneficial impact on paleontological resources because the management prescriptions associated with them would limit surface disturbing activities.				
	The potential for inadvertent impacts to paleontological resources under Alternative N would be greatest among all the alternatives, due to: • Allowing cross-country OHV use on 77 percent of the RFO • Allowing oil and gas leasing on 78 percent of the RFO • Designating 75 percent of the RFO as VRM Classes III or IV.	The potential for inadvertent impacts to paleontological resources under Alternative A would be less than under Alternative N but greater than under the Proposed RMP or Alternatives C or D because of the potential for surface disturbing activities resulting from: • Allowing cross-country OHV use on 21 percent of the RFO • Allowing oil and gas leasing on 79 percent of the RFO • Designating 79 percent of the RFO	The potential for inadvertent impacts to paleontological resources under the Proposed RMP would be less than under Alternatives N or A but greater than under Alternatives C and D because of limitations on surface disturbing activities resulting from: • Allowing cross-country OHV use on less than 1 percent of the RFO • Closing to leasing or allowing NSO on 28 percent of the RFO • Designating 33 percent of the RFO	The potential for inadvertent impacts to paleontological resources under Alternative C would be less than under Alternatives N and A and the Proposed RMP but greater than under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to leasing or allowing NSO on 35 percent of the RFO • Designating 32 percent of the RFO as VRM Classes I	The potential for inadvertent impacts to paleontological resources would be least under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to leasing or allowing NSO on 57 percent of the RFO • Designating 56 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals,

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
		as VRM Classes III or IV • Recommending no ACECs or suitable WSRs.	as VRM Classes I or II • Recommending one eligible WSR as suitable.	or II • In addition to existing withdrawals, recommending withdrawal of 8 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as suitable.	recommending withdrawal of 35 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as suitable • Protecting, preserving, and maintaining all non-WSA lands with wilderness characteristics.
Visual Resources	Under Alternative N, 25 percent of the RFO would be designated VRM Classes I or II. This would provide more protection for scenic resources than under Alternative A and less than under the Proposed RMP and Alternatives C and D.	Under Alternative A, 21 percent of the RFO would be designated VRM Classes I or II, providing the least protection for scenic resources among the alternatives.	Under the Proposed RMP, 33 percent of the RFO would be designated VRM Classes I or II. This would provide more protection for scenic resources than under Alternatives N or A and less than under Alternatives C and D.	Under Alternative C, 32 percent of the RFO would be designated VRM Classes I or II. This would provide more protection for scenic resources than under Alternatives N or A or the Proposed RMP and less than under Alternative D.	Under Alternative C, 56 percent of the RFO would be designated VRM Classes I or II, providing the greatest protection for scenic resources among the alternatives.
	Under Alternative N, 77 percent of the RFO would be open to cross-country OHV use, including 206,000 acres in VRM Class II areas. The potential for impacts to scenic resources from OHV use would be greatest under Alternative N.	Under Alternative A, 21 percent of the RFO would be open to cross-country OHV use. The potential for impacts to scenic resources from OHV use would be less than under Alternative N, but greater than under the Proposed RMP and Alternatives C and D.	Under the Proposed RMP, less than 1 percent of the RFO would be open to cross-country OHV use, reducing the potential for impacts substantially compared with Alternatives N and A.	No cross-country OHV use would be allowed, eliminating the potential for impacts to scenic resources from OHV use. Alternatives C and D would provide the greatest protection for scenic resources.	
Special Status Species	The implementation of decisions that would have the greatest potential adverse effects on SSS would be actions that allow surface disturbing activities. The implementation of decisions that would have the greatest potential beneficial effects to SSS would be actions				

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	that would directly protect SSS and their habitat or indirectly protect SSS through surface restrictions. These actions would include: • SSS management • Protecting, preserving, and maintaining non-WSA lands with wilderness characteristics • Special Designations (ACECs, WSRs, WSAs) • Visual Resource Management Class I or II designations.				
	The potential for impacts to SSS under Alternative N would be greatest among all the alternatives, due to: • Allowing cross-country OHV use on 77 percent of the RFO • Maintaining minimal restrictions on other surface disturbing activities.	The potential for impacts to SSS under Alternative A would be less than under Alternative N but greater than under the Proposed RMP or Alternatives C or D because of the potential for surface disturbing activities resulting from: • Allowing cross-country OHV use on 21 percent of the RFO • Maintaining minimal restrictions on other surface disturbing activities • Recommending no ACECs or suitable wild and scenic rivers.	The potential for impacts to SSS under the Proposed RMP would be less than under Alternatives N or A, but greater than under Alternatives C and D because of limitations on surface disturbing activities resulting from: • Allowing cross-country OHV use on less than 1 percent of the RFO • Closing to leasing or allowing NSO on 28 percent of the RFO • Designating 33 percent of the RFO as VRM Classes I or II • Recommending one eligible WSR as suitable • Designating two ACECs (2,530 acres).	The potential for impacts to SSS under Alternative C would be less than under Alternatives N and A and the Proposed RMP but greater than under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to oil and gas leasing or allowing NSO on 35 percent of the RFO • Designating 32 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 8 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as	The potential for impacts to SSS would be least under Alternative D because of limitations on surface disturbing activities resulting from: • Allowing no cross-country OHV use • Closing to oil and gas leasing or allowing NSO on 57 percent of the RFO • Designating 56 percent of the RFO as VRM Classes I or II • In addition to existing withdrawals, recommending withdrawal of 35 percent of the RFO from mineral entry • Designating all potential ACECs • Recommending all eligible WSRs as suitable • Protecting, preserving, and

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
				suitable.	maintaining all non-WSA lands with wilderness characteristics.
Fish and Wildlife	Under Alternative N, managing fire using a full suite of tools would allow for the graduated movement to a more ecologically sustainable condition and reduction of hazardous fuels. However, continuing minimal treatments on a case-by-case basis could contribute to fuel loading, setting the stage for catastrophic fires, and consequent loss of wildlife habitat. Current forage allocations would continue, providing no additional benefits to wildlife. Seventy-seven percent of the lands managed by the RFO would remain open to cross-country OHV use, leaving wildlife vulnerable to displacement and harassment and habitat susceptible to degradation.	Under Alternative A, implementing an appropriate management response strategy would allow the use of wildland fire as a vegetation management tool, benefiting wildlife species and habitat. A full range of tools would be available for fuels management and other vegetation treatments, allowing the greatest flexibility to enhance wildlife habitats. Current forage allocations would continue, providing no additional benefits to wildlife. Twenty-one percent of the lands managed by the RFO would remain open to cross-country OHV use, reducing the potential for wildlife displacement and harassment, and habitat degradation compared with Alternative N.	Under the Proposed RMP, implementing an appropriate management response strategy would allow the use of wildland fire as a vegetation management tool, benefiting wildlife species and habitat (same as Alternative A). A full range of tools would be available for fuels management and other vegetation treatments, allowing the greatest flexibility to enhance wildlife habitats (same as Alternative A). Less than 1 percent of the lands managed by the RFO would remain open to cross-country OHV use, greatly reducing the potential for wildlife displacement and harassment, and habitat degradation compared with Alternatives N and A.	Under Alternatives C and D, implementing an appropriate management response strategy would allow the use of wildland fire as a vegetation management tool, benefiting wildlife species and habitat (same as Alternatives A and the Proposed RMP). Only prescribed fire and other natural means would be used to manage fuel and other vegetation, limiting options for treatment that in some cases might not be effective, reducing the benefit to wildlife compared with Alternatives A and the Proposed RMP. None of the lands managed by the RFO would remain open to cross-country OHV use, eliminating the possibility of displacement, harassment, and habitat degradation. Establishing the Henry Mountains ACEC for bison and mule deer values would recognize the relevance and importance of these resources and provide special management emphasis to enhance them.	
	Alternatives N and A, with their accommodation for oil and gas development and cross-country OHV use, would have the greatest adverse impacts on fish, wildlife, and their habitats.		The Proposed RMP would balance the impacts of development with the need to protect fish, wildlife, and their habitats.	Alternatives C and D, with their special designations and emphasis on conservation, would be most beneficial to fish, wildlife, and their habitats.	
Wild Horses and	The preliminary AML for the wild burros would		Establishing a formal	The wild burro AML would be the largest of the	

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Burros	maintain a viable population. Forage allocations are sufficient for the wild burros in the northern portions of the HMA; however, there could be competition for forage resources in the southern portions. The potential for displacement of wild burros from OHV use exists.		wild burro AML would maintain the viability of the population and result in the long-term maintenance of wild burro habitat components. The Proposed RMP could eliminate habitat competition between livestock and wild burros, but displacement from OHV use would continue. None of the impacts are anticipated to be significant.	alternatives, which could increase competition for habitat resources with wildlife and livestock.	
Fire and Fuels Management	• Maintaining State of Utah air quality standards could result in fewer acres burned using prescribed fires or wildland fire use because NAAQS could be exceeded. If the air quality of Class I airsheds were adversely affected, wildland fire use and prescribed fires could be suspended. Consideration of regional haze could increase the restrictions on wildland fire use or prescribed fire. • Managing WSAs under the IMP precludes the use of mechanical (chaining, harrowing) and manual (chainsaw) fuels reduction treatments. This could limit the ability to maintain or restore properly functioning vegetation and reduce hazardous fuels in WSAs, including those in the Dirty Devil, Horseshoe Canyon, and Henry Mountains areas.				
	• Allowing vegetation treatment using mechanical, wildland, and/or prescribed fire, and chemical treatments on a case-by-case basis would move vegetation toward a more ecologically sustainable condition over a multi-year period. • Proposed decisions for visual resource management could	• Allowing use of a full range of vegetation management tools, including mechanical, biological, manual, prescribed and wildland fire use, and chemical (herbicides) would complement the ability to maintain and restore properly functioning vegetation and reduce hazardous	• Allowing use of a full range of vegetation management tools, including mechanical, biological, manual, prescribed and wildland fire use, and chemical (herbicides) would complement the ability to maintain and restore properly functioning vegetation and reduce hazardous	• Restrictions on the use of non-fire treatments would limit the ability to maintain or restore properly functioning vegetation and reduce hazardous fuels in some areas. • Proposed decisions for visual resource management could preclude some types of treatments within the 21	• Restrictions on the use of non-fire treatments which would limit the ability to maintain or restore properly functioning vegetation and reduce hazardous fuels in some areas. • Proposed decisions for visual resource management could preclude some types of treatments within the 53

				fuels.	with wilderness characteristics would preclude the use of mechanical (chaining, harrowing) and manual (chainsaw) fuels reduction treatments on these lands. This could limit the ability to maintain or restore properly functioning vegetation and reduce hazardous fuels in some areas, such as parts of the Henry Mountains.
Non-WSA Lands with Wilderness Characteristics	Impacts to non-WSA lands with wilderness characteristics would be the greatest among the alternatives: • Nine-six percent of these lands would be open to cross-country OHV use. • Eight-five percent of these lands would be open to oil and gas leasing with standard stipulations. • Thirteen percent of these lands would be open to oil and gas leasing with moderate	Impacts to non-WSA lands with wilderness characteristics would be less than Alternative N and greater than the Proposed RMP and Alternatives C and D: • Thirty-two percent of these lands would be open to cross-country OHV use. • Forty-eight percent of these lands would be open to oil and gas leasing with standard stipulations. • Fifty-two percent of these lands would	Impacts to the non-WSA lands with wilderness characteristics would be less than Alternatives N and A and greater than Alternatives C and D: • Less than 1 percent of these lands would be open to cross-country OHV use. • All of the non-WSA lands with wilderness characteristics would be open to oil and gas leasing subject to major constraints (NSO). • Two percent of	Impacts to non-WSA lands with wilderness characteristics would be less than Alternatives N and A and the Proposed RMP but greater than Alternative D: • None of these lands would be open to cross-country OHV use. • Thirty percent of these lands would be open to oil and gas leasing with standard stipulations. • Thirty-nine of these lands would be open to oil and gas	Impacts to non-WSA lands with wilderness characteristics would be the least among the alternatives: • None of these lands would be open to cross-country OHV use. • None of these lands would be open to oil and gas leasing. • All of these lands would be recommended for withdrawal from mineral entry. • All would be designated Class I

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	constraints. • One percent of these lands would be open to oil and gas leasing with major constraints (NSO).	be open to oil and gas leasing with moderate constraints.	these lands would be recommended for withdrawal from mineral entry.	leasing with moderate constraints. • One percent of these lands would be recommended for withdrawal from mineral entry.	VRM.
Forestry and Woodland Products	Alternative N would continue restrictions on timber harvesting and commercial woodland product sales included in current management plans. The potential production of forest and woodland resources would likely be less than under Alternatives A and the Proposed RMP but more than under Alternatives C and D.	Alternative A would allow timber sales, woodland products harvesting, and seed and live plant collecting on the most acres with the most tools and fewest restrictions among the alternatives. Alternative A would provide the greatest availability of forest and woodland products and the greatest opportunities to restore, maintain, and improve forest and woodland health.	The Proposed RMP would allow timber sales, woodland products harvesting, and seed and live plant collecting with the same tools as Alternative A but on slightly fewer acres because of the addition of one suitable WSR corridor that would be restricted and decisions to protect, preserve, and maintain the wilderness characteristics associated with non-WSA lands with wilderness characteristics. The potential production of forest and woodland products and potential forest and woodland health could be slightly less than under Alternative A but more than under Alternatives N, C or D.	Under Alternative C, commercial timber sales would be precluded, greatly diminishing the availability of timber products for commercial use. Woodland products harvesting and seed and live plant collecting would be the same as Alternatives A and the Proposed RMP but on fewer acres because of restrictions in all 12 suitable WSR corridors. The potential production of forest and woodland products and potential forest and woodland health would be less than under Alternatives A and the Proposed RMP, similar to that under Alternative N, but more than under Alternative D.	Under Alternative D, commercial timber sales would be precluded, and no commercial or non-commercial use of forest and woodland products or seed and live plants would be allowed within suitable WSR corridors and non-WSA lands with wilderness characteristics. Alternative D would result in the least production of forest and woodland products and could result in the greatest impacts to forest and woodland health.
Livestock Grazing	• Oil and gas development could reduce land available for livestock grazing under all alternatives by a maximum of 3,080 acres based on the Reasonably Foreseeable Development (RFD) Scenario for Oil and Gas, equating to a loss of 385 AUMs and possibly affecting the viability of some allotments. • Increasing recreational use could increase conflicts between recreationists and livestock.				

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	• Increasing OHV use could increase conflicts between OHVs and livestock in some areas.				
	Decisions likely to affect grazing opportunities include: • Continuing to allow cross-country OHV use on 77 percent of the RFO.	Decisions likely to affect grazing opportunities include: • Allowing cross-country OHV use on 21 percent of the RFO • Disposing of 13,400 acres of public land (Section 203 sales) that would reduce available and could affect the viability of some allotments.	Decisions likely to affect grazing opportunities include: • Disposing of 13,400 acres of public land (Section 203 sales) that would reduce available AUMs and could affect the viability of some allotments. • Under the Proposed RMP, 600 AUMs would be allocated to burros in the Canyonlands HMA, to meet an AML upper limit of 100.	Under Alternatives C and D, decisions likely to affect grazing opportunities include: • Fewer acres identified for vegetation treatment than Alternatives A and the Proposed RMP. • Limitations on the use of chemicals (pesticides and herbicides) for treating noxious weed and insect pest problems.	
Recreation	Alternative N would provide the greatest opportunities for motorized recreation uses and would cause the greatest adverse impacts to non-motorized uses. Seventy-seven percent of the RFO would continue to be open to cross-country OHV use, and 4,315 miles of routes would continue to be open to motor vehicles, the most under any of the alternatives. One SRMA (managed	Alternative A would provide fewer opportunities for motorized recreation than Alternative N, but more than the Proposed RMP and Alternatives C and D. Twenty-one percent of the RFO would be open to cross-country OHV use. The open areas include those currently used for cross-country travel, plus additional areas for growth. OHV use in 79 percent of the RFO would be limited to	The Proposed RMP would provide a balance of motorized and non-motorized recreation opportunities. It would provide fewer opportunities for motorized recreation than Alternatives N and A, but more than Alternatives C and D. Less than 1 percent of the RFO would be open to cross-country OHV use; however, the four open areas, Big Rocks, Factory Butte, Glenwood, and Aurora,	Alternative C would provide more opportunities for non-motorized recreation than under Alternatives N and A and the Proposed RMP and more opportunities for motorized recreation than under Alternative D. No areas would be open to cross-country OHV use. OHVs would be limited to designated routes on 68 percent of the RFO. Designated routes would total 3,192 miles, 73 percent of the	Alternative D would provide the greatest opportunities for non-motorized recreation, the fewest opportunities for motorized recreation uses, and have the greatest adverse impact on motorized users. No areas would be open to cross-country OHV use. OHVs would be limited to designated routes on 46 percent of the RFO. Designated routes would total 3,043 miles, 71 percent of the routes open under Alternative

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	by the Fillmore FO) would continue, but no new SRMAs would be established. There would be no VRM Class I areas, and 25 percent of the RFO would be managed as VRM Class II, which supports primitive and semi-primitive recreation opportunities. Seventy-five percent of the RFO would be managed as VRM Classes III and IV supporting all types of recreation, including motorized use. Conflicts between motorized and non-motorized users would continue, and adverse effects on primitive and semi-primitive recreation settings would continue to increase.	designated trails. Designated routes would total 4,312 miles, essentially the same as those open under Alternative N. No areas would be closed to OHVs. The Dirty Devil SRMA would provide opportunities for primitive and semi-primitive motorized and non-motorized recreation; the Factory Butte, Sahara Sands and Big Rocks SRMAs would provide opportunities for cross-country OHV use; and the Otter Creek SRMA would provide opportunities for dispersed camping. Twenty-one percent of the RFO would be designated as VRM Class I supporting primitive recreation. No lands would be designated as VRM Class II. Seventy-nine percent of the RFO would be designated as VRM Classes III and IV supporting all types of recreation, including motorized use. The decisions in Alternative A would help resolve conflicts between motorized and non-motorized users.	are the areas currently most used by riders. OHVs would be limited to designated trails on 90 percent of the RFO's land. Designated routes would total 4,277 miles. Ten percent of the lands managed by the RFO would be closed to OHVs. The Henry Mountains, Capitol Reef Gateway, and Dirty Devil SRMAs would provide opportunities for primitive and semi-primitive motorized and non-motorized recreation; the Factory Butte and Big Rocks SRMAs would provide opportunities for cross-country OHV use. Thirty-three percent of the RFO would be designated as VRM Classes I and II supporting primitive and semi-primitive recreation, 67 percent would be designated as VRM Classes III and IV supporting all types of recreation, including motorized use. The decisions in the Proposed RMP would help resolve conflicts between motorized and non-motorized users.	routes open under Alternative N. Thirty-two percent of the lands managed by the RFO would be closed to OHVs. The Henry Mountains, Capitol Reef Gateway, Dirty Devil, and Sevier Canyon SRMAs would provide opportunities for primitive, semi-primitive motorized and non-motorized, and roaded natural recreation. Thirty-two percent of the RFO would be designated as VRM Classes I and II supporting primitive and semi-primitive recreation; and 68 percent would be designated as VRM Classes III and IV, supporting all types of recreation, including motorized use. While Alternative C would reduce adverse effects on primitive and semi-primitive recreation settings, conflicts between motorized and non-motorized users could be exacerbated because of the limited opportunities for motorized use.	N. Fifty-four percent of the RFO would be closed to OHVs. Seven SRMAs would be established to provide opportunities for primitive, semi-primitive motorized and non-motorized recreation. Portions of two of these SRMAs would provide some areas with opportunities for dispersed recreation. Fifty-six percent of the RFO would be designated as VRM Classes I and II supporting primitive and semi-primitive recreation; 44 percent would be designated as VRM Classes III and IV supporting all types of recreation, including motorized use. While Alternative D would reduce adverse effects on primitive and semi-primitive recreation settings, conflicts between motorized and non-motorized users could be exacerbated because of the limited opportunities for motorized use.

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Travel Management	Management decisions that involve changes to miles of roads open for public or administrative use, number of acres open to off-road travel, or specific travel restrictions (vehicle size, season restrictions, etc.) would affect access into and across the RFO.				
	Alternative N provides the greatest opportunity for unrestricted motorized use and access with 77 percent of the RFO designated as open to motorized use, and 13 percent limited to designated routes (4,315 miles). Access would be restricted within 10 percent of the RFO designated as closed for the protection of WSAs, ACECs and cultural resources.	Under Alternative A, open motorized use areas would be reduced to 21 percent, with the remainder of the RFO limited to designated routes (4,312 miles). Alternative A provides fewer acres for unrestricted motorized use than Alternative N, but more than under the Proposed RMP and Alternatives C and D. The miles of routes available would only be reduced by 3 miles from Alternative N. SRMA management within 49 percent of the open areas could enhance the open motorized experiences in those areas. No areas would be closed under Alternative A.	Under the Proposed RMP, open motorized use would be reduced significantly compared with Alternatives N and A, to less than 1 percent, which would affect motorized use and access. Limited acres would be 90 percent, the most under any alternative. Motorized use would be allowed on 4,277 miles of routes, which would be less than under Alternatives N and A, but more than under Alternatives C and D. SRMA management within 86 percent of the open areas could enhance the open motorized experiences in those areas. Access would be restricted within 10 percent of the RFO designated as closed for the protection of WSAs, WSR corridors, ACECs, and SRMAs. The potential for impacts from closed areas would be the same as under Alternative N, greater than under Alternative A, and less than under Alternatives C and D.	Under Alternative C, no open motorized use areas would be designated, eliminating cross-country travel. Access would be allowed in 68 percent of the RFO with use limited to designated routes (3,192 miles). The acres and miles of routes available for travel would be less than under Alternatives N and A and the Proposed RMP, but more than Alternative D. Access would be restricted within 32 percent of the RFO designated as closed for the protection of WSAs, WSR corridors, ACECs, and SRMAs. The potential for impacts from closed areas would be greater than under Alternatives N and A, but less than under Alternative D.	Under Alternative D, no open motorized use areas would be designated, eliminating cross-country travel. Access would be allowed in 46 percent of the RFO with use limited to designated routes (3,043 miles). The acres and miles of routes available for travel would be the least of any of the alternatives. Access would be restricted within 54 percent of the RFO designated as closed for the protection of WSAs, WSR corridors, non-WSA lands with wilderness characteristics, ACECs, and SRMAs. The potential for impacts from closed areas would be the greatest under Alternative D.
~~Lands and Realty~~	Under Alternative N, 280	One hundred and eighteen parcels totaling 13,400		No lands would be identified as available for sale	

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	acres would be identified as available for FLPMA Section 203 sales. Inholdings within the wilderness study areas and four existing ACECs would be priorities for acquisition.	acres would be available for sale under FLPMA Section 203. These sales would improve the manageability of the public land estate by disposing of parcels isolated and/or difficult to manage and could provide opportunities for community expansion. Conversely, grazing land, open space, wildlife habitat and land available for other public land uses would be lost. Inholdings within the WSAs (under Alternative A and the Proposed RMP), one suitable WSR corridor and two areas of critical environmental concern would be priorities for acquisition (the Proposed RMP only).		under FLPMA Section 203; hence there would be no beneficial or adverse impacts. Inholdings within the WSAs, 12 suitable WSR corridors, and 16 areas of critical environmental concern would be priorities for acquisition, the most among the alternatives.	
	The potential for impacts to ROWs under Alternative N would be greater than under Alternative A, but less than under the Proposed RMP and Alternatives C, and D, because of management of avoidance/exclusion areas for: • WSAs • ACECs • Eligible WSR corridors • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.	The potential for impacts to ROWs because of management of avoidance/exclusion areas would be the least under Alternative A and would include: • WSAs • Areas closed to oil and gas leasing.	The potential for impacts to ROWS under the Proposed RMP would be greater than under Alternatives N and A, but less than under Alternatives C and D, because of management of avoidance/exclusion areas for: • WSAs • ACECs • Suitable WSR corridor • Non-WSA lands with wilderness characteristics • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.	The potential for impacts to ROWs under Alternative C would be greater than under Alternatives N, A, and the Proposed RMP, but less than under Alternative D, because of management of avoidance/exclusion areas for: • WSAs • ACECs • Suitable WSR corridors • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.	The potential for impacts to ROWS because of management of avoidance/exclusion areas would be the greatest under Alternative D and would include: • WSAs • ACECs • Suitable WSR corridors • Non-WSA lands with wilderness characteristics • Areas closed to oil and gas leasing • Areas open to oil and gas leasing with NSO stipulations.
Leasable Minerals	Seventy-eight percent of the RFO would be open to oil and gas leasing,	Seventy-nine percent of the RFO would be open to oil and gas leasing,	Seventy-nine percent of the RFO would be open to oil and gas leasing	Seventy-two percent of the RFO would be open to oil and gas leasing,	Forty-five percent of the RFO would be open to oil and gas leasing,

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	providing slightly less opportunity than under Alternatives A and the Proposed RMP and more opportunity than under Alternatives C or D.	providing the greatest opportunity for oil and gas exploration and development among the alternatives.	(similar to Alternative A). However, more acres would be under CSU and timing stipulations. Fewer acres would be open under standard stipulations.	providing less opportunity than under Alternatives N and A and the Proposed RMP and more opportunity than under Alternative D.	providing the least opportunity for oil and gas leasing among the alternatives.
Locatable Minerals	Under all alternatives, 154,700 acres (7 percent of the RFO) currently withdrawn from mineral entry would remain withdrawn, precluding opportunities for mining on those lands.				
	Under Alternative N, 14,780 acres are proposed for withdrawal from mineral entry. Mining opportunity would be less than under Alternative A but greater than under the Proposed RMP and Alternatives C or D.	Under Alternative A, no additional lands are proposed for withdrawal from mineral entry, providing the greatest opportunity for mining.	Under the Proposed RMP, 21,500 acres are proposed for withdrawal from mineral entry. Mining opportunity would be less than under Alternatives N or A but greater than under Alternatives C or D.	Under Alternative C, 176,400 acres are proposed for withdrawal from mineral entry. Mining opportunity would be less than Alternatives N and A or the Proposed RMP but greater than under Alternative D.	Under Alternative D, 749,200 acres are proposed for withdrawal from mineral entry. Mining opportunity would be the least among the alternatives.
Salable Minerals	Seventy-eight percent of the RFO would be open to mineral material disposal, providing slightly less opportunity than under Alternatives A and the Proposed RMP and more opportunity than under Alternatives C or D.	Seventy-nine percent of the RFO would be open to mineral material disposal, providing the greatest opportunity for the disposal of mineral materials among the alternatives.	Seventy-nine percent of the RFO would be open to mineral material disposal, which is virtually identical to that proposed under Alternative A.	Seventy-two percent of the RFO would be open to mineral material disposal, providing less opportunity than under Alternatives N and A and the Proposed RMP and more opportunity than under Alternative D.	Forty-five percent of the RFO would be open to mineral material disposal, providing the least opportunity for disposal of mineral materials among the alternatives.
Wilderness Study Areas	Under all alternatives, WSA management is guided primarily by BLM Handbook H-8550-1, *Interim Management Policy for Lands under Wilderness Review*. The IMP directs that WSAs are managed not to impair their suitability for preservation as wilderness. Additionally, BLM policy requires that WSAs be closed to oil and gas leasing and designated as VRM Class I. Collectively, this management direction protects the wilderness characteristics of the WSAs.				
	Within 10 of the 11 WSAs, 41.5 miles of inventoried ways would continue to be designated for use by motor vehicles, which would temporarily affect	All WSAs would be designated as limited to OHV use, and 51.6 miles of ways would be designated as open to motorized vehicles, the most of any alternative.	Area designations under the Proposed RMP would be the same as Alternative N. An additional 2.5 miles of ways would be designated as open to	All WSAs would be closed to motorized use, which would preclude impacts to wilderness characteristics from motorized vehicles.	

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	solitude and opportunities for primitive recreation in areas adjacent to the open ways. The rugged terrain of these areas has presented a barrier to vehicle intrusions in the past and would likely continue to do so in the future, although advancing vehicle technology could allow vehicles to enter and affect areas they have not been able to access in the past. • The continued use of these ways would be conditioned on non-impairment of wilderness suitability.	The potential impacts to naturalness and solitude from vehicle intrusions would be the greatest among the alternatives. • The continued use of these ways would be conditioned on non-impairment of wilderness suitability.	motor vehicle use (44.0 miles total), resulting in more potential impacts to wilderness characteristics than under Alternatives N, C, and D but less than Alternative A. • The continued use of these ways would be conditioned on non-impairment of wilderness suitability.		
Wild and Scenic Rivers	Under all alternatives, all or parts of seven eligible rivers totaling 98 river miles are within WSAs, including most of the Dirty Devil River and its side drainages. This represents 73 percent of the eligible river miles. The outstandingly remarkable values of these river segments would be protected by WSA management, which would preclude oil and gas leasing, designate them as VRM I (under Alternative A, the Proposed RMP, Alternative C, and Alternative D), and otherwise protect the values as prescribed by the IMP.				
	There would be no impacts to outstandingly remarkable values because no suitability determination would be made and all eligible river segments would be protected.	There could be potential impacts to the outstandingly remarkable values of eligible segments outside WSAs because no eligible river segments would be recommended as suitable.	There would be no impacts to outstandingly remarkable values within the Fremont Gorge eligible river segment (5 miles) which would be recommended as suitable.	Under Alternatives C and D, all eligible river segments (135 miles) would be recommended as suitable, precluding impacts to outstandingly remarkable values.	

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
ACECs	Continue designation and management of the four existing ACECs: • North Caineville Mesa • South Caineville Mesa • Gilbert Badlands • Beaver Wash Canyon. Decisions under Alternative N could pose a threat of irreparable harm to relevant and important values in the following potential ACECs: • Badlands (that portion outside the existing South Caineville and Gilbert Badlands ACECs) • Bull Creek	No ACECs would be designated under Alternative A, with no special management prescriptions for the relevant and important values. Other decisions under Alternative A could pose a threat of irreparable harm to relevant and important values.	The North Caineville Mesa and Old Woman Front would be designated as ACECs and special management prescriptions would apply to these areas under the Proposed RMP. Resource decisions under the Proposed RMP, as well as existing laws, rules, and regulations would protect the relevant and important values of the remaining potential ACECs. Management decisions that provide protection to relevant and important values include, but are not limited to: • VRM Class I and II designation for Class A scenery	All potential ACECs would be designated under Alternatives C and D. Consequently, decisions under Alternatives C and D would pose no threat of irreparable harm to any relevant and important values in any of the potential ACECs.	

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
ACECs	• Dirty Devil/North Wash (that portion outside the existing Beaver Wash Canyon ACEC) • Fremont Gorge/ Cockscomb • Henry Mountains • Horseshoe Canyon • Kingston Canyon • Little Rockies • Lower Muddy Creek • Old Woman Front • Parker Mountain • Quitchupah • Rainbow Hills • Sevier Canyon • Thousand Lake Bench • Special Status Species.		• Special management to protect SSS • Special management to protect fish and wildlife and their habitats • Non-WSA lands with wilderness characteristics • Closing or limiting OHV use to designated routes, except in small managed open areas • More oil and gas leases subject to moderate or major constraints • Other management prescriptions, such as those for WSR and WSAs.		
Socioeconomic Environment	Alternative N would continue current management practices. It would continue to allow commodity development and resource extraction to occur at current trends supporting jobs and associated income in the local economy. Continued development of minerals would also	Alternative A gives priority to commodity and resource extraction. Employment and income associated with motorized access, commodity development, and resource extraction could cause a slight increase in employment and income in the local economy compared to Alternative N.	The Proposed RMP seeks to provide a balanced approach to resource management. Managing 78,600 acres of non-WSA lands with wilderness characteristics to protect, preserve, and maintain their wilderness characteristics, 5 miles of WSR segments, and more ACEC areas than	Alternative C would allow for resource uses for economic benefits while increasing protection of natural values. Employment and income associated with motorized access, commodity development, and resource extraction could decrease compared with Alternative N because of	Alternative D would allow for resource uses for economic benefits while maximizing protection of natural values, including 1,160,500 acres of the study area unavailable for oil and gas leasing and 682,600 acres of non-WSA lands with wilderness characteristics.

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	provide tax revenues to the State of Utah and local government entities. Alternative N continues most current land management policies and practices, which would be welcomed by some users in and beyond the socioeconomic study area but found less desirable by many others, who see a variety of adverse impacts and foregone opportunities under current management. Specifically, most of the RFO (77%) would be open for OHV use throughout 1,636,400 acres that could continue to provide ample opportunities for motorized recreation while resulting in increased user conflicts between those interested in motorized recreation and those interested in preservation and non-motorized recreation. It is likely that given current trends, conflicts between these and other resource users would increase.	Additionally, slightly increased mineral development could provide additional tax revenues to the State of Utah and local government entities and could result in increased demands on community services. Existing conflicts between conservation-minded individuals and groups and the pro-development community are expected to rise with increases expected in commodity and resource extraction. In addition, conflicts between certain types of recreationists (motorized and non-motorized) and livestock grazing are expected to continue. Alternative A's limitations to 449,000 acres open to OHV use could produce some impacts on local custom and culture such as some motorized recreation users of BLM lands could be restricted. At the same time provision of increased facilities and no WSR or ACEC designations would improve some recreational experiences for many motorized recreation users and could reduce some	Alternative A (but less than Alternative N) could affect employment and income associated with motorized access, commodity development, and resource extraction, However, employment and income levels are expected to be similar to Alternative A. Additionally, tax revenue from mineral development could be slightly less than Alternative A. Existing conditions and social trends would generally remain the same. Conflicts between conservation-minded individuals and groups and the pro-development community are expected to decline in some areas where resource extraction is restricted. The Proposed RMP would have some favorable impacts on individuals and groups who favor preservation over resource development compared to Alternative A. Specifically management of SRMAs areas would improve some recreational experiences for many non-motorized recreation users and could reduce some	increased restrictions on use of the public lands and harvesting of natural resources. However, businesses that rely on more primitive land uses would benefit. Additionally, restricting mineral development is expected to provide decreased tax revenues to the State of Utah and local government entities, compared to Alternative N. Alternative C could have some adverse impacts on individuals and groups who favor resource development over preservation. Alternative C would somewhat favor persons and groups interested in non-motorized recreation and preservation of habitat, ecosystem, visual, and similar values of natural landscapes from special designations for 135 miles of WSR segments and 886,810 acres of ACECs. However, opportunities for commodity and mineral development, motorized recreation (including 2,601 miles of designated routes of OHV use), and other more traditional uses of	Employment and income associated with motorized access, commodity development, and resource extraction could experience the most affects compared to all the other alternatives because of increased restrictions on use of the public lands and harvesting of natural resources. However, businesses that rely on more primitive land uses would benefit the most from Alternative D. Additionally, restricted mineral development of oil and gas could provide the greatest decrease in tax revenues to the State of Utah and local government entities including slightly reduced state revenues from potential losses to SITLA. Alternative D would have more pronounced adverse impacts on individuals and groups who favor resource development over preservation. Alternative D would most favor persons and groups interested in non-motorized recreation and preservation of habitat, ecosystem, visual, and similar values of natural

Resource	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
		conflicts with non-motorized users. Alternative A would include land and vegetation treatments to increase livestock forage availability that would be welcomed by livestock grazing interests.	conflicts with motorized users. In addition, conflicts between certain types of recreationists (motorized and non-motorized) and livestock grazing are expected to decline in some areas.	BLM lands would still exist. Impacts are not expected to affected government services.	landscapes. However, opportunities for commodity and mineral development, motorized recreation, and other more traditional uses of BLM lands would still exist. Impacts are not expected to affected government services.
Socioeconomic Environment	Livestock grazing would continue to generate some economic benefits from livestock operations (depending on available AUMs), and social values of ranching would continue.				
Environmental Justice	There are no environmental justice populations in the socioeconomic study area, and actions required to identify and mitigate impacts to such populations are not required.				
Health and Safety	• None of the land allocations or prescriptions proposed in Chapter 2 would affect BLM's ability to deal with hazardous and solid wastes within the RFO. • None of the management actions proposed in Chapter 2 would increase public exposure to the risks associated with abandoned mines within the RFO.

CHAPTER 3—AFFECTED ENVIRONMENT

3.1 INTRODUCTION

This chapter describes the existing conditions for Bureau of Land Management (BLM) resources, resource uses, special designations, and the socioeconomic environment within the Richfield Field Office (RFO) planning area. A variety of laws, regulations, policies, and other requirements direct management of resources and resource uses on public lands administered by the BLM. The affected environment is used as the baseline of existing conditions against which the impacts of the different alternatives are analyzed and compared in Chapter 4.

3.2 OVERVIEW OF THE PLANNING AREA

The planning area encompasses 5.4 million acres in Sanpete, Sevier, Piute, and Wayne counties, and portions of Garfield County. There are also 21,500 acres of Kane County within the planning area. These acres, however, lie entirely within Glen Canyon National Recreation Area (NRA) so no decisions within this RMP will affect those lands. Within this area, BLM manages 2.1 million acres of public land surface and mineral estate, and an additional 95,000 acres of split estate lands (federal minerals where the surface estate is in state or private ownership). The BLM also has administrative responsibility for 2,082,865 acres of mineral estate where the surface is managed by other federal agencies (U.S. Forest Service [USFS] and National Park Service [NPS]). Noted geographic features of the RFO include the Henry Mountains, Parker Mountain, Fremont River, Dirty Devil River, Gilbert Badlands, and Factory Butte. Acreage calculations used in this chapter and elsewhere in this document reflect current data in BLM's geographic information system (GIS) and may differ from acreages displayed in older documents that were calculated by other methods. In this document, the term "planning area" applies to all lands within the 5 county area regardless of surface ownership. The term "Richfield Field Office" (RFO) applies only to the BLM-administered public lands and resources within the planning area. All acres in text and tables represent surface acres unless otherwise noted.

3.2.1 Physiography

The planning area is located primarily in south-central Utah and lies almost entirely within the Colorado Plateau and the Colorado Plateau-Basin and Range Transition physiographic provinces (Hunt 1974, Stokes 1986) except for a small portion of northern Sanpete County, which is within the Middle Rocky Mountains province.

As shown on Map 3 of the *Mineral Potential Report* (BLM 2005b), the eastern part of the planning area is in the Colorado Plateau province. This area is characterized by relatively flat-lying sedimentary strata uplifted to elevations between 5,000 and 10,000 feet above sea level, and that are predominantly Paleozoic to Mesozoic in age. In places, the strata are deeply incised as canyons; in others, they are relatively broad bench lands. Strata in the eastern part of the planning area are intruded by igneous rocks that form the Henry Mountains.

The western part of the planning area is in the Colorado Plateau-Basin and Range Transition Zone. This province has similarities to the Colorado Plateau to the east and to the Basin and Range to the west. Similarly to the Colorado Plateau, the sedimentary strata in the Transition Zone are relatively flat lying. Similarly to the basin and range, the physiography of the Transition Zone includes fault-bounded, north-

trending ranges that are separated by valleys. In addition, the Sevier and Sanpete Valleys and adjacent ranges are part of one of the world's classic fold-and-thrust belts (DeCelles and Coogan 2006). Many of the ranges are capped by Tertiary volcanic rocks. One of the largest volcanic fields in the United States is the Marysvale Volcanic Field, which includes the Tushar Mountains and parts of adjacent plateaus.

The southern end of the Middle Rocky Mountains province extends into the northern highlands of Sanpete County along the drainage divide between the Spanish Fork and San Pitch rivers. Rocks in the area include Upper Cretaceous and Tertiary strata similar to those present in the Colorado Plateau to the east, along with Middle Tertiary volcanic deposits of the Moroni Formation.

3.2.2 Topography and Drainage

Overall, elevations across the planning area range from a high of 12,173 feet on Mount Delano, located on the crest of the Tushar Mountains in the Fishlake National Forest, to a low of around 3,700 feet on Lake Powell in Glen Canyon NRA. Mountain summits are typically 9,000 to 11,000 feet in elevation, with valley bottoms at 5,000 feet. The Green and Colorado rivers drain the eastern portion of the planning area, whereas areas to the west have internal drainage to either the Sevier or Utah Lake basin. The Sevier River, which drains most of the western portion of the planning area, discharges to Sevier Lake.

3.3 PHYSICAL, BIOLOGICAL, AND CULTURAL RESOURCES

3.3.1 Air Resources

This section describes the climate and existing air quality in the region potentially affected by alternatives described in Chapter 2. Air pollutants addressed in this Proposed RMP/Environmental Impact Statement (EIS) include criteria pollutants, hazardous air pollutants, and compounds that could cause visibility impairment or atmospheric deposition. Regional air quality is influenced by the interaction of several factors, including meteorology, climate, the magnitude and spatial distribution of local and regional air pollutant sources, and the chemical properties of emitted air pollutants. Elements of air quality addressed in this analysis include ambient air quality concentrations, visibility, and atmospheric deposition. Chapter 3 of the *Management Situation Analysis* (MSA) contains detailed information concerning air quality (BLM 2004a).

3.3.1.1 Global Climate Change

Ongoing scientific research has identified potential impacts of climate changing pollutants on the global climate. These pollutants are commonly called "greenhouse gases" and include carbon dioxide (CO_2), methane, nitrous oxide, water vapor, and several trace gas emissions. Through complex interactions on a regional and global scale, these emissions cause a net warming effect of the atmosphere, primarily by decreasing the amount of heat energy radiated by the Earth back into space. Although climate changing pollutant levels have varied for millennia (along with corresponding variations in climatic conditions), recent industrialization and burning of fossil carbon sources have caused CO_2 concentrations to increase dramatically and are likely to contribute to overall climatic changes, typically referred to as global warming. Increasing CO_2 concentrations also lead to preferential fertilization and growth of specific plant species.

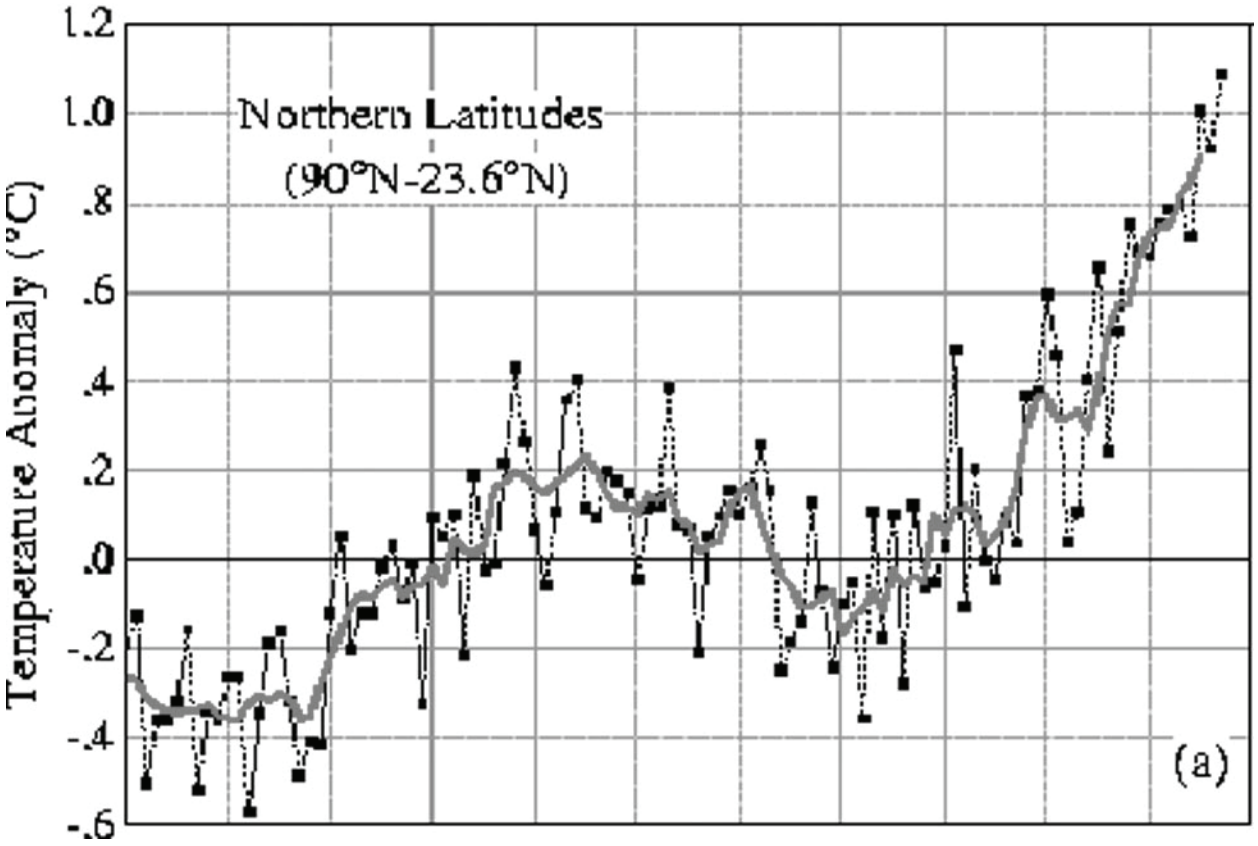
Global mean surface temperatures have increased nearly 1.0°C (1.8°F) from 1890 to 2006 (Goddard Institute for Space Studies, 2007). However, observations and predictive models indicate that average temperature changes are likely to be greater in the Northern Hemisphere. Figure 3-1 demonstrates that northern latitudes (above 24° N) have exhibited temperature increases of nearly 1.2°C (2.1°F) since 1900, with nearly a 1.0°C (1.8°F) increase since 1970. Without additional meteorological monitoring systems, it is difficult to determine the spatial and temporal variability and change of climatic conditions, but increasing concentrations of these greenhouse gases are likely to accelerate the rate of climate change.

The Intergovernmental Panel on Climate Change (IPCC) has recently completed a comprehensive report assessing the current state of knowledge on climate change, its potential impacts, and options for adaptation and mitigation. At printing of this PRMP/FEIS, this assessment is available on the IPCC website at www.ipcc.ch/. According to this report, global climate change may ultimately contribute to a rise in sea level, destruction of estuaries and coastal wetlands, and changes in regional temperature and rainfall patterns, with major implications to agricultural and coastal communities. The IPCC has suggested that the average global surface temperature could rise 1 to 4.5 degrees Fahrenheit (°F) in the next 50 years, with significant regional variation. The National Academy of Sciences (2006) confirmed these findings but also indicated that there are uncertainties regarding how climate change may affect different regions. Computer models indicate that such increases in temperature will not be equally distributed globally but are likely to be accentuated at higher latitudes, such as in the Arctic, where the temperature increase may be more than double the global average (BLM 2007a). Also, warming during the winter months is expected to be greater than during the summer, and increases in daily minimum

temperatures are more likely than increases in daily maximum temperatures. Vulnerabilities to climate change depend considerably on specific geographic and social contexts.

BLM recognizes the importance of climate change and the potential effects it may have on the natural environment. Several activities occur within the planning area that may generate emissions of climate changing pollutants. For example, oil and gas development, large fires, and recreation using combustion engines can potentially generate CO_2 and methane. Wind erosion from disturbed areas and fugitive dust from roads along with entrained atmospheric dust have the potential to darken glacial surfaces and snow packs, resulting in faster snowmelt. Other activities may help sequester carbon, such as managing vegetation to favor perennial grasses and increase vegetative cover, which may help build organic carbon in soils and function as "carbon sinks."

Figure 3-1. Annual Mean Temperature Change for Northern Latitudes (24 - 90° N)



Source: Goddard Institute for Space Studies (2007)

3.3.1.2 Climate

Indicators of climate include temperature, precipitation, wind, barometric pressure, humidity, sunshine and cloudiness. Issues of concern with respect to climate include climate variability (how changes in climate may affect resources) and climate change (how human activities and other factors may affect climate). Climate change indicators reported in this RMP include monitored (measured by an instrument) values.

An area's climate is determined mainly by latitude, distance from the ocean and elevation. The world's eco-regions are characterized by typical climate and are classified by domain, division and province. Domains include polar, humid temperate, humid tropical and dry. The west coast and the eastern half of the United States are classified as humid temperate, the southern tip of Florida and Hawaii are classified as humid tropical, most of Alaska is classified as polar, with southern Alaska classified as humid temperate, and most of the western United States is classified as dry. Dry climates are the most extensive climate group, occurring on more than one quarter of the earth's surface. Eco-region divisions of the dry domain include desert (temperate, temperate mountainous and tropical/sub-tropical) and steppe (temperate, temperate mountainous, tropical/sub-tropical, and tropical/sub-tropical mountainous). Steppes are typically grasslands of short grasses, with shrubs and trees. The eco-region of most of the Richfield planning area is classified as temperate, dry (semidesert), intermountain and mountain area. (http://www.fs.fed.us/land/ecosysmgmt/ecoreg1_home.html).

3.3.1.3 Ambient Air Quality Standards

The Clean Air Act (CAA) Amendment of August 7, 1977 (Section 160) identifies the following air quality areas:

- Class I—the most restrictive class applies to areas in which practically any change in air quality would be considered significant.
- Class II—this class applies to areas in which deterioration normally accompanying moderate, well-controlled growth would be considered insignificant.
- Class III—this class applies to areas in which deterioration to ambient standards is allowed.

Most of the RFO and all of the lands managed by the BLM are generally classified as a Class II air quality area (40 Code of Federal Regulations [CFR] Part 81.345). Five Class I areas are in close proximity or within the boundaries of the planning area: Capitol Reef National Park and a portion of Canyonlands National Park are within the planning area boundary; and Arches National Park, Bryce Canyon National Park, Zion National Park, and the remainder of Canyonlands National Park are located adjacent to or near the planning area (Map 3-2). Protection of air quality in these Class I areas may require additional mitigation or protection measures to avoid potential impacts from BLM authorized activities.

Overall air quality in the RFO is good. Based on the region's remoteness, low population, limited industrial development and a lack of major urban communities, counties in the planning area are designated as "attainment" or "unclassifiable" with respect to National Ambient Air Quality Standards (NAAQS) for all criteria pollutants. As of May 2006, the air quality in the planning area had not been designated as "non-attainment" for any criteria pollutant. In addition, based on the *2006 Division of Air Quality Annual Report,* the area is likely to be in attainment with respect to the new particulate matter (PM) 2.5 standards enacted in September 2006, although the final determination has not yet been made (Utah Department of Air Quality [UDAQ] 2007).

The air pollutant of most concern on public lands that could affect the Class I areas is particulate matter, which may originate from fire, fugitive dust, or vehicle use. Air resources are affected predominantly by existing concentrations of various pollutants and the climatic and meteorological conditions. Map 3-2 shows the Class I air quality areas within and adjacent to the planning area.

3.3.1.4 Air Pollutant Concentrations

Air pollutant concentration usually refers to the mass of pollutants present in a volume of air and can be reported in units of micrograms per cubic meter ($\mu g/m^3$). Concentration can also be reported on a volume basis as parts per billion (ppb) and parts per million (ppm).

Air pollutant concentration monitoring networks in Utah include the **S**tate & **L**ocal **A**ir **M**onitoring **S**ystem (SLAMS), Tribal monitoring networks and the **C**lean **A**ir **S**tatus & **T**rends **Net**work (CASTNet). SLAMS stations are located in urban areas and measure "criteria pollutants". The Utah Department of Environmental Quality operates the SLAMS network to establish compliance with regulatory concentration standards. CASTNet stations are located in remote areas and measure concentrations of compounds that are of interest to ecosystem health.

Criteria Air Pollutants

Criteria air pollutants are those for which national concentration standards have been established. Measured pollutant concentrations greater than these standards represent a risk to human health or welfare. Criteria air pollutants include carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), ozone (O_3), particulate matter (PM_{10}, $PM_{2.5}$) and lead (Pb). Criteria air pollutant concentrations are compared to National Ambient Air Quality Standards (NAAQS).

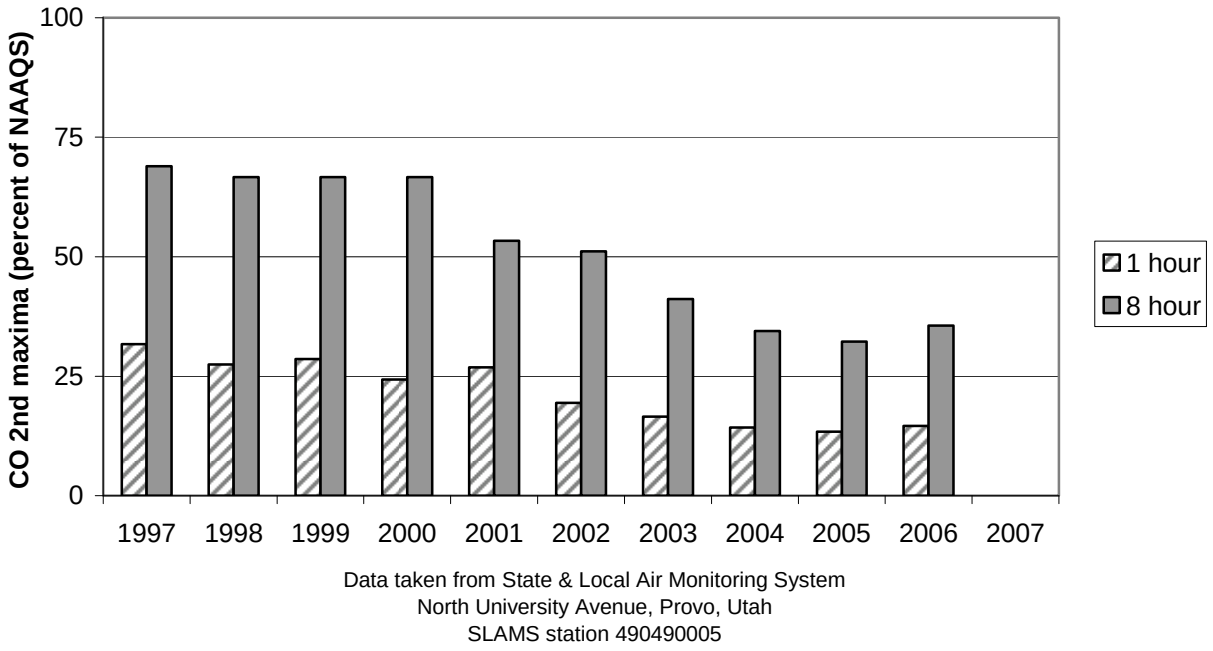
Some criteria air pollutant modeled concentrations are compared to the Prevention of Significant Deterioration (PSD) increments. The goal of the PSD program is to protect public health and welfare from air pollution effects, notwithstanding attainment and maintenance of the NAAQS, and "to preserve, protect and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores and other areas of special national or regional natural, recreation, scenic or historic value." PSD increments have been established for NO_2, SO_2 and PM_{10}.

Specific monitoring protocols, known as reference (or equivalent) methods, must be followed to determine compliance with UAAQS and NAAQS. The UDEQ performs regulatory monitoring throughout the State of Utah for CO, NO_2, O_3, PM_{10} and $PM_{2.5}$.

Carbon Monoxide

CO is an odorless, colorless gas formed during combustion of any carbon-based fuel, such as operation of engines, fireplaces, furnaces, etc. High concentrations of CO affect the oxygen-carrying capacity of the blood and can lead to unconsciousness and asphyxiation. Forest fires are natural sources of CO. No CO monitoring has been performed in the Richfield area. However, CO data has been collected at Provo, Utah since 1997. Figure 3-2 shows the results. CO levels have been decreasing and no violations of the ambient air quality standards are noted. (Since CO levels are directly related to automobile traffic, these data should be considered high for Richfield.)

Figure 3-2. Carbon Monoxide Concentrations Near the Richfield Planning Area

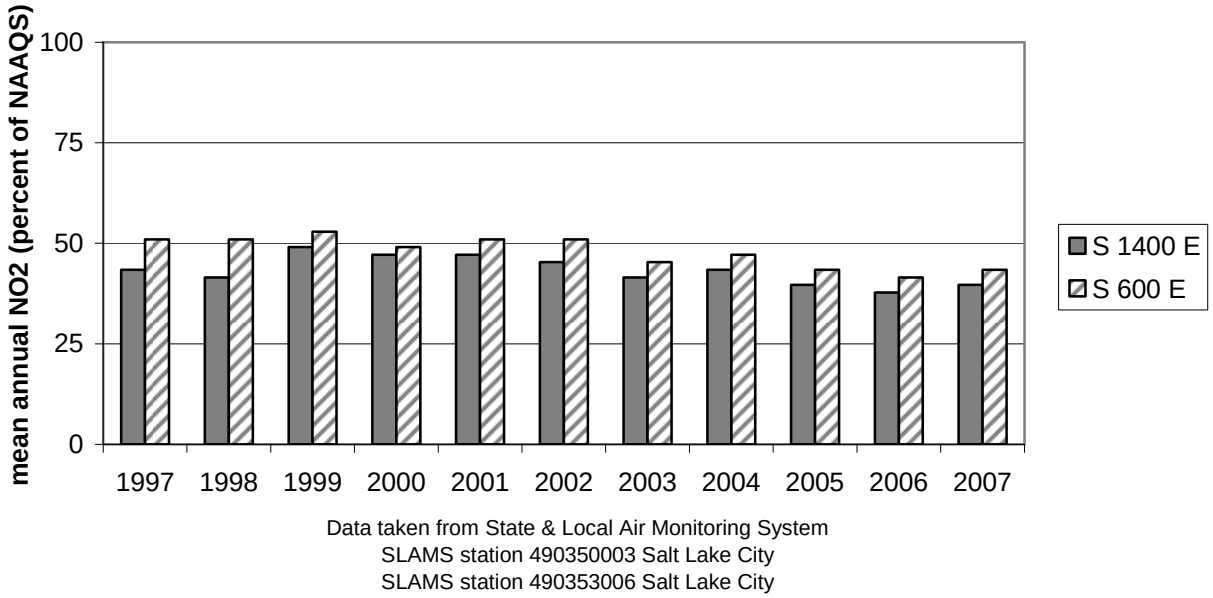


Data taken from State & Local Air Monitoring System
North University Avenue, Provo, Utah
SLAMS station 490490005

Nitrogen Dioxide

NO_2 is a highly reactive compound formed at high temperatures during operation of fossil fuel combustion, At high concentrations, it can form a red-brown gas. At concentrations in excess of the EPA air quality standard, it is a respiratory irritant, however, all areas of the United States are in compliance with this air quality standard. During fossil fuel combustion, NO is released into the air which reacts in the atmosphere to form NO_2. NO plus NO_2 is a mixture of nitrogen gases, collectively called nitrogen oxides (NO_x). NO_x emissions can convert to ammonium nitrate particles and nitric acid which can cause visibility impairment Bacterial action in soil can be a natural source of nitrogen compounds. No NO_2 monitoring has been performed in the Richfield area. However, NO_2 data has been collected at Salt Lake City, Utah since 1997. Figure 3-3 shows the results. NO_2 levels have been decreasing and no violations of the ambient air quality standards are noted. (Since NO_2 levels are related to automobile traffic and industrial emissions, these data should be considered high for Richfield.)

Figure 3-3. Mean Annual Nitrogen Dioxide Concentrations Near the Richfield Planning Area



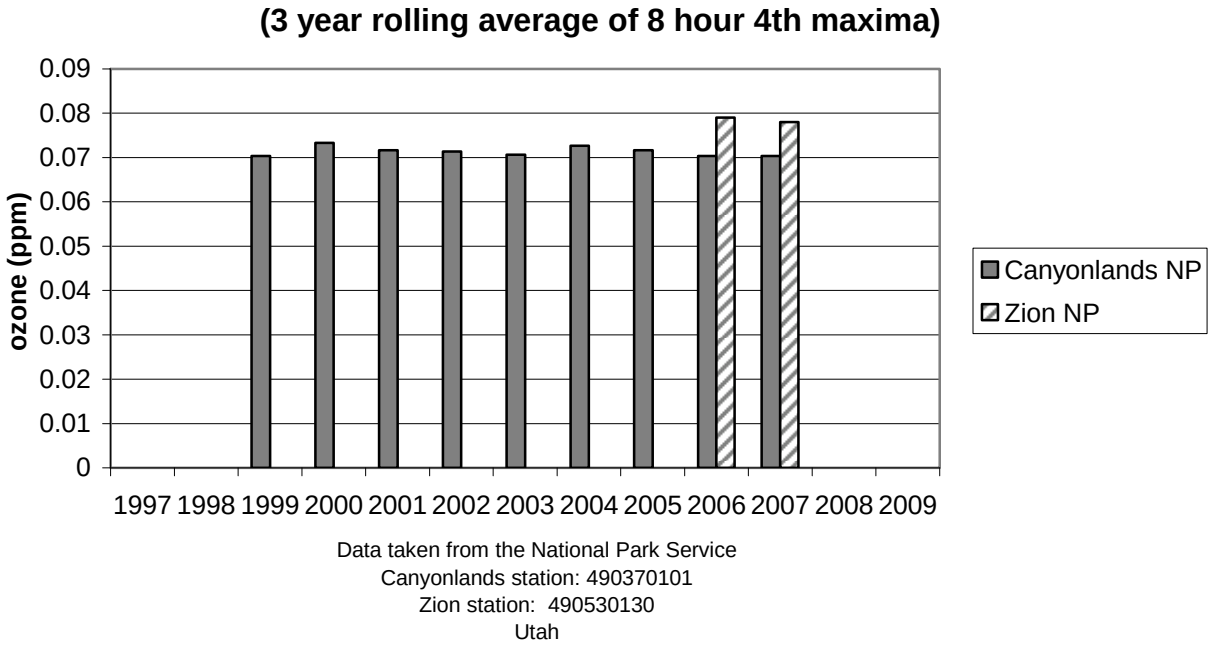
Data taken from State & Local Air Monitoring System
SLAMS station 490350003 Salt Lake City
SLAMS station 490353006 Salt Lake City

Ozone

O_3 is a faint blue gas that is generally not emitted directly into the atmosphere, but is formed from NO_x and volatile organic compounds (VOC) emissions. Internal combustion engines are the main source of NO_x. Sources of VOC include paint, varnish and some types of vegetation (i.e., sage brush and conifers). O_3 is a strong oxidizing chemical that can burn lung and eyes, and damage plants.

Ozone data has been collected at Zion National Park since 1999 and Canyonlands national Park since 2006. Figure 3-4 shows the results. It is noted that ozone levels could exceed the newly proposed ambient air quality standard. The current 8-hour NAAQS for ozone is 0.075 ppm.

Figure 3-4. Ozone Concentrations Near the Richfield Planning Area



Data taken from the National Park Service
Canyonlands station: 490370101
Zion station: 490530130
Utah

Particulate Matter

Particulate matter (i.e., soil particles, hair, pollen, etc.) is essentially the small particles suspended in the air which settle to the ground slowly and may be re-suspended if disturbed. Separate allowable concentration levels for particulate matter are based on the relative size of the particle:

- Particulate Matter (PM_{10}), particles with diameters less than 10 micrometers, are small enough to be inhaled and can cause adverse health effects.
- Fine Particulate Matter ($PM_{2.5}$), particles with diameters less than 2.5 micrometers, are so small that they can be drawn deeply into the lungs and cause serious health problems. These particles are also the main cause of visibility impairment.

PM concentrations for monitoring sites near the Richfield area are shown in Figure 3-5 through Figure 3-8. The measured concentrations show compliance with ambient air quality standards, except with the new 24 hour average $PM_{2.5}$ standard. The current 24-hour NAAQS for $PM_{2.5}$ is 35 micrograms/m^3 and the annual arithmetic mean is 15.0 micrograms/m^3.

Data from State & Local Air Monitoring System
Duchesne County Tribal station 490137011
Moab SLAMS station 490190006
Uintah County Tribal station 490477022

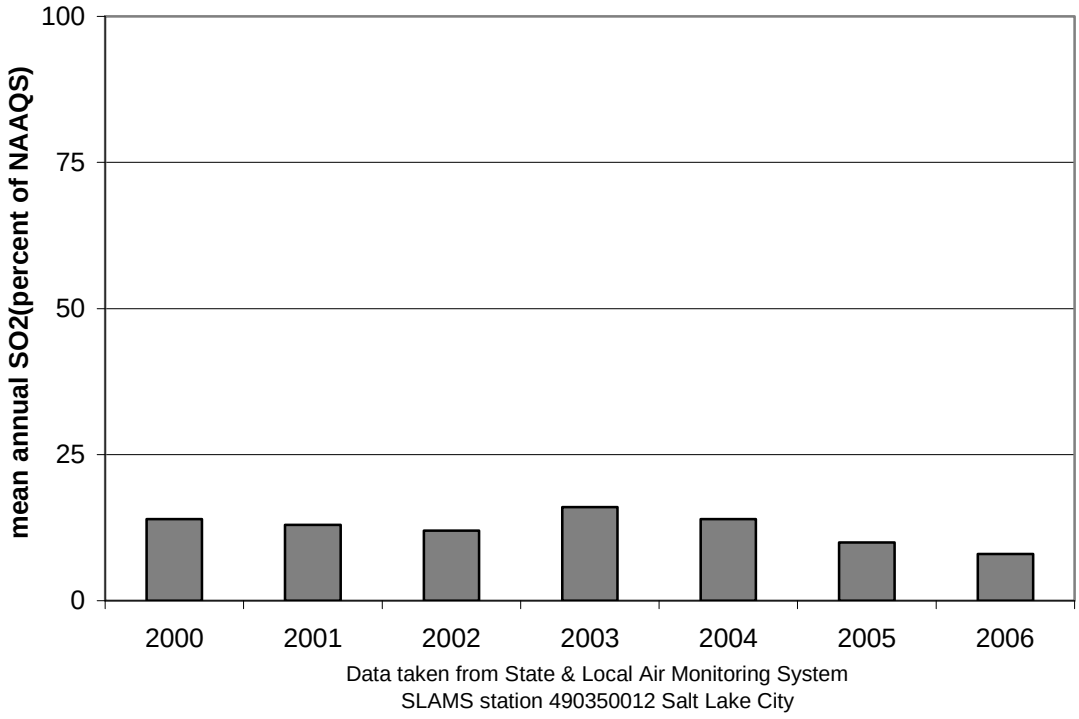
Sulfur Dioxide

SO_2 forms during combustion from trace levels of sulfur in coal or diesel fuel, and can convert to ammonium sulfate (SO_4^{--}) and sulfuric acid (H_2SO_4) which can cause visibility impairment and acid rain. Volcanoes are natural sources of SO_2.

SO_2 monitoring has been performed at by the State of Utah in and around Salt Lake City. Figure 3-9 shows the annual results at Salta Lake City. SO_2 levels have been slightly decreasing and no violations of the ambient air quality standards are noted.

Figure 3-9. Mean Annual Sulfur Dioxide Concentrations Near the Richfield Planning Area



Nitrogen and Sulfur Compounds

Other air pollutants of interest include nitrogen compounds such as particulate nitrate (NO_3), nitric acid (HNO_3) and ammonium (NH_4), and sulfur compounds such as particulate sulfate (SO_4) and sulfur dioxide (SO_2). Although monitoring of these air pollutants typically does not adhere to reference methods, these concentration data contribute to our understanding of air quality.

The **C**lean **A**ir **S**tatus and **T**rends **Net**work (CASTNet) has measured concentrations of nitric acid, nitrate and ammonium, as well as ozone, sulfur dioxide and sulfate, in the United States since the late 1980's. There is one CASTNet stations in Utah at Canyonlands NP. Figure 3-10 shows mean annual concentrations of nitrogen compounds in Canyonlands National Park from 1995. These data are representative of the area potentially affected by BLM actions within the Richfield Planning area and are less than those typical for remote areas.

Figure 3-10. Mean Annual Nitrogen Compounds Concentrations Near the Richfield Planning Area

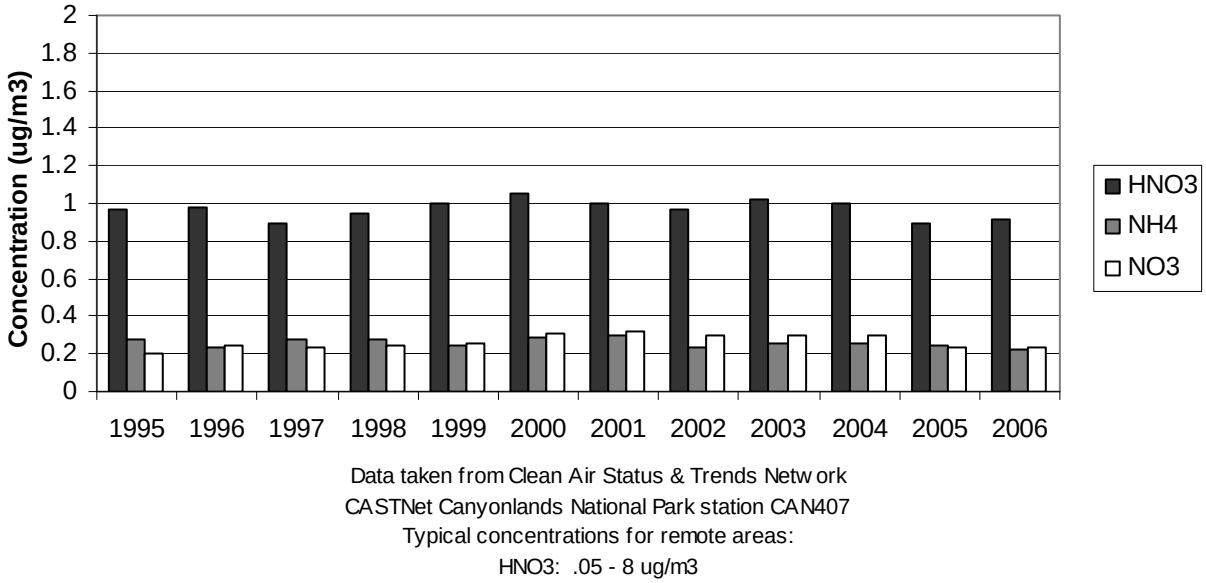


Figure 3-11 shows mean annual concentrations of sulfur compounds in Canyonlands National Park from 1995. These data are representative of the area potentially affected by BLM actions within the Richfield Planning area and are less than those typical for remote areas.

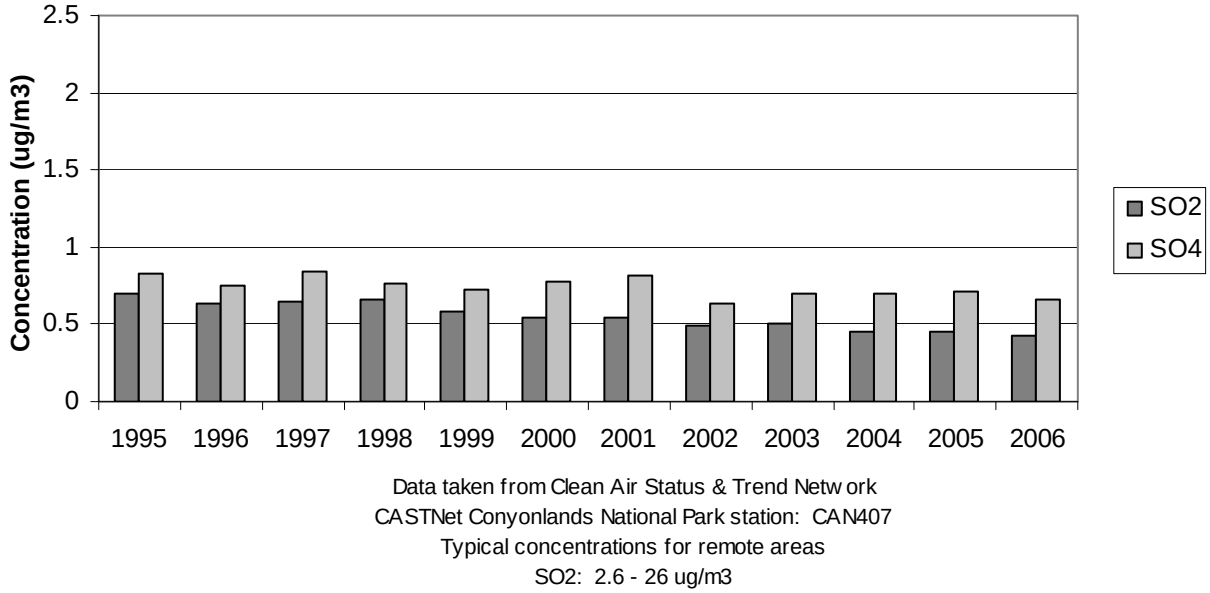
Figure 3-11. Mean Annual Sulfur Compounds Concentrations Near the Richfield Planning Area



Hazardous Air Pollutants

Hazardous air pollutants (HAPs) are those pollutants that are known or suspected to cause cancer or other serious health problems, such as chronic respiratory disease, reproductive disorders or birth defects. The EPA has classified 189 air pollutants as HAPs, including formaldehyde (CH_20), benzene, toluene, ethylbenzene, xylene, and n-hexane.

Potential concentrations of HAPs are compared to inhalation reference concentrations to estimate the risk of health effects.

3.3.1.5 Visibility

Visibility can be defined as the ability to see color, texture and contrast at a distance and can be reported as visual range, in units of distance such as miles.

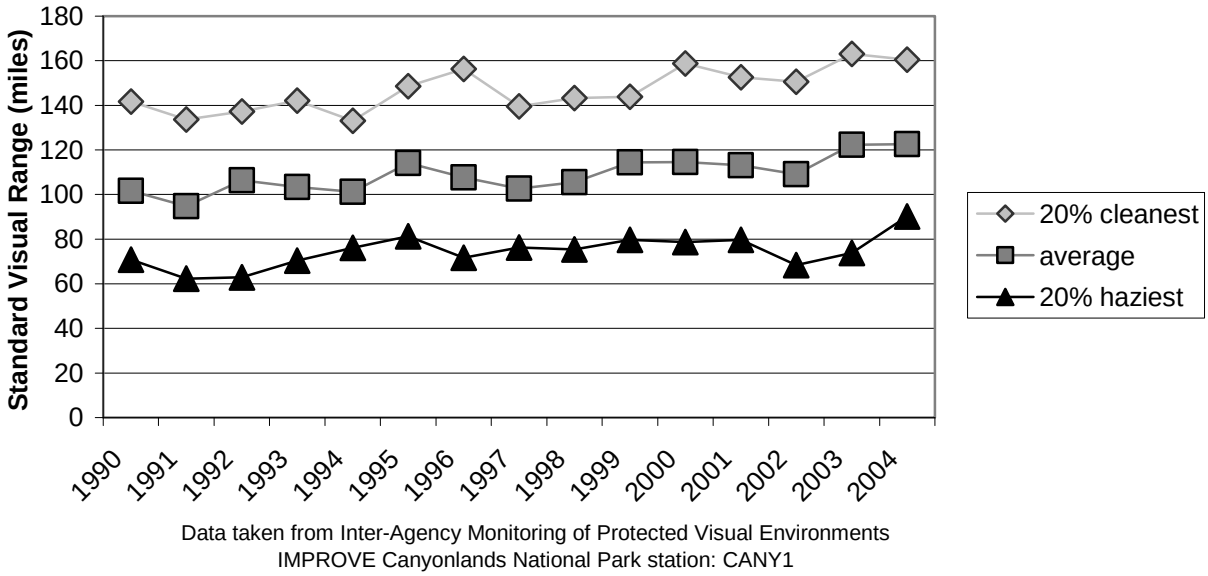
Visibility can be expressed in terms of deciview (dv), a measure for describing perceived changes in visibility. One dv is defined as a change in visibility that is just perceptible to an average person.

Visibility data are calculated for each day, ranked from cleanest to haziest, and reported into three categories:

- 20% cleanest: mean visibility for the 20% of days with the best visibility
- average: the annual mean visibility
- 20% haziest: mean visibility for the 20% of days with the poorest visibility

The IMPROVE network has measured visibility in Class I areas throughout the US. There are 7 IMPROVE stations in Utah: Arches, Bryce Canyon, Canyonlands, Capitol Reef, Lone Pine, Zion and Zion Canyon National Parks. Visibility data have been measured in Canyonlands National Park from 1988 through the present. Mean annual visual range varies from 130 to 162 miles on clear days, 93 to 121miles on average days and 61 to 90 miles on hazy days (Figure 3-12). These data are representative of the area potentially affected by BLM actions within the Richfield planning area.

Figure 3-12. Annual Visibility Near the Richfield Planning Area



Data taken from Inter-Agency Monitoring of Protected Visual Environments
IMPROVE Canyonlands National Park station: CANY1

3.3.1.6 Atmospheric Deposition

Atmospheric deposition refers to the processes by which air pollutants are removed from the atmosphere and deposited on terrestrial and aquatic ecosystems, and is reported as the mass of material deposited on an area (kilogram per hectare - year). dry deposition (gravitational settling of particles and adherence of gaseous pollutants to soil, water and vegetation).

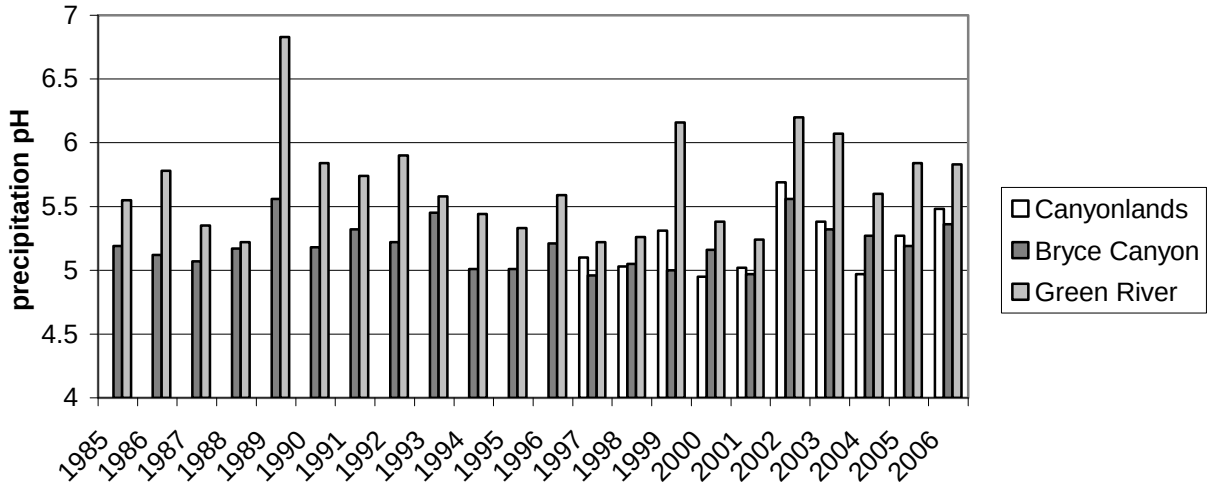
Atmospheric deposition can cause acidification of lakes and streams. One expression of lake acidification is change in acid neutralizing capacity (ANC), the lake's capacity to resist acidification from atmospheric deposition. Acid neutralizing capacity is expressed in units of micro-equivalents per liter (μeq/l).

Wet Deposition

Wet deposition refers to air pollutants deposited by precipitation, such as rain and snow. One expression of wet deposition is precipitation pH, a measure of the acidity or alkalinity of the precipitation.

There are 5 NADP stations in Utah: Logan, Murphy Ridge, Green River, Bryce Canyon NP and Canyonlands NP. The NADP stations in Bryce Canyon NP and Canyonlands NP have assessed precipitation chemistry from 1985 and 1997 through to the present. Figure 3-13 shows precipitation pH has ranged from 4.9 to 6.8.

Figure 3-13. Mean Annual Precipitation pH Near the Richfield Planning Area



Data taken from National Atmospheric Deposition Program
NADP Canyonlands station: UT09
NADP Bryce Canyon station: UT99
NADP Green River station: UT98
Normal range of precipitation pH:

Dry Deposition

Dry deposition refers to the transfer of airborne gaseous and particulate material from the atmosphere to the Earth's surface.

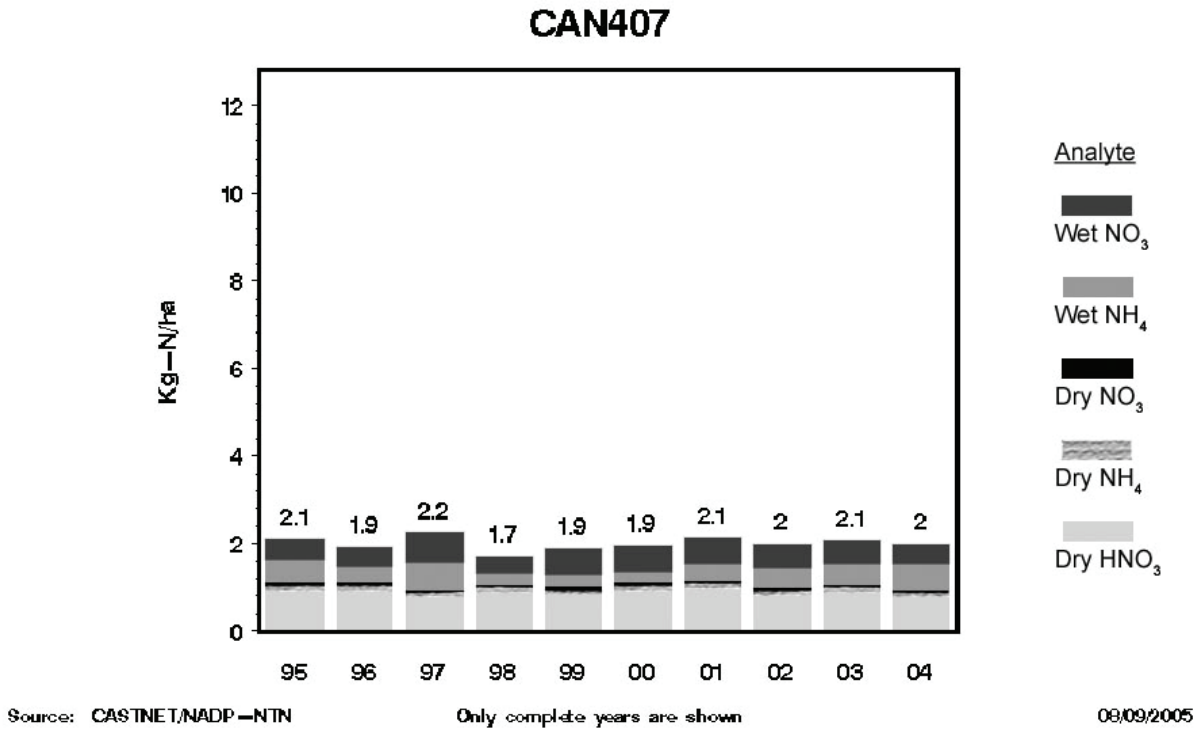
The **C**lean **A**ir **S**tatus and **T**rends network (CASTNet) has measured dry deposition of ozone (O_3), sulfur dioxide (SO_2), nitric acid (HNO_3), sulfate (SO_4^{--}), nitrate (NO_3^-), and ammonium (NH_4^{++}), in the United States since the late 1980's. There is one CASTNet stations in Utah at Canyonlands NP.

Total Deposition

Total deposition refers to the sum of airborne material transferred to the Earth's surface by both wet and dry deposition. Total nitrogen deposition is calculated by summing the nitrogen portion of wet and dry deposition of nitrogen compounds, and total sulfur deposition is calculated by summing the sulfur portion of wet and dry deposition of sulfur compounds.

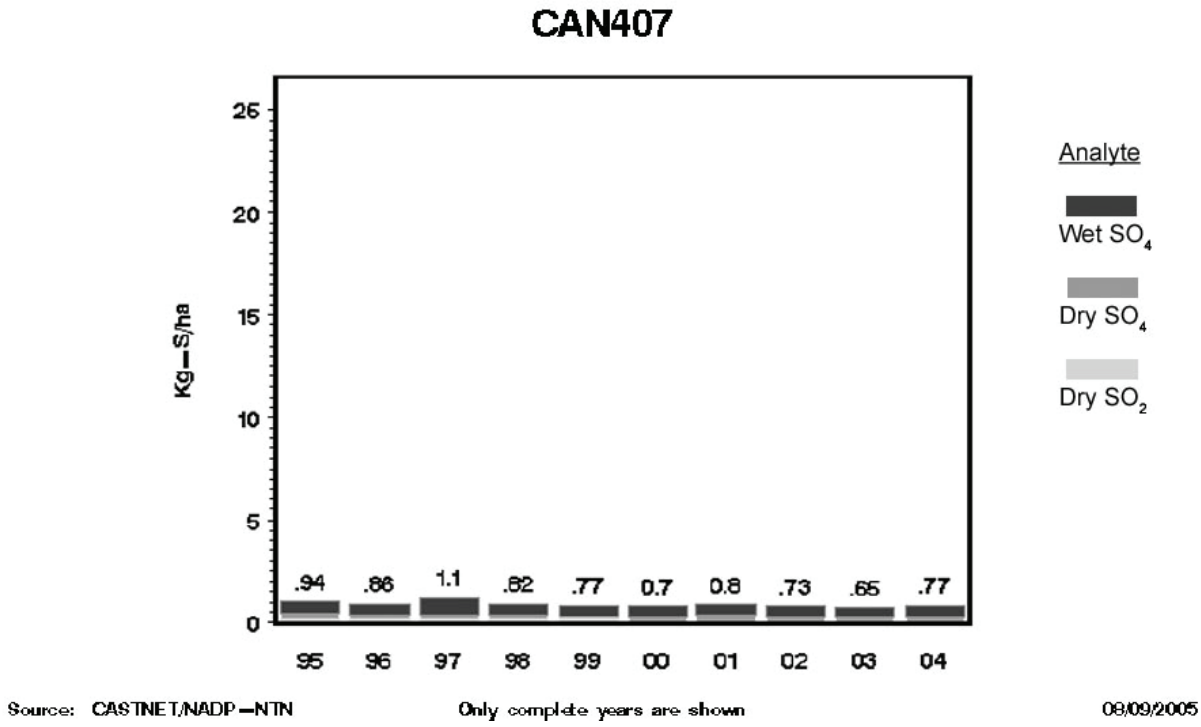
Total deposition has been measured at Canyonlands National Park from 1995 through the present. Total nitrogen deposition has ranged from 1.7 to 2.2 kg/hectare-year since 1995 (Figure 3-14).

Figure 3-14. Total Nitrogen Deposition at Canyonlands National Park



Total sulfur deposition has ranged from 0.7 to 1.1 kg/hectare-year since 1995 (Figure 3-15).

Figure 3-15. Total Sulfur Deposition at Canyonlands National Park



Lake Chemistry

Atmospheric deposition can cause acidification of lakes and streams. One expression of lake acidification is change in acid neutralizing capacity (ANC), the lake's capacity to resist acidification from atmospheric deposition. Acid neutralizing capacity is expressed in units of micro-equivalents per liter (μeq/l). Lakes with ANC values of from 25 to 100 μeq/l are considered to be sensitive to atmospheric deposition, lakes with ANC values of from 10 to 25 μeq/l are considered to be very sensitive, and lakes with ANC value of less than 10 are considered to be extremely sensitive. Lakes within the Uinta Mountains have ANC values 10-150 μeq/l.

3.3.2 Soil Resources

Soil data and associated ecological site descriptions are used in evaluating the site's potential productivity and are critical to evaluating rangeland health as well as determining impacts of various management activities. Soil erosion is one indicator of rangeland health. Soil surveys have been completed for about three-quarters of the planning area, although some surveys are more than 20 years old. Published surveys include Fairfield-Nephi Area (1984), Millard County, East (2003), Sanpete Valley (1981), and the Henry Mountains Area (1990). The National Resources Conservation Service (NRCS) is currently revising the survey for Sevier County. Piute County and the western portion of Wayne County lack soil surveys and ecological site inventories.

3.3.2.1 Soil Resource Condition

Soil composition is one factor that determines vegetation growth and wildlife habitats. Soil types also influence water quality, salinity, and erosion throughout the planning area. BLM considers impacts of various management decisions on soils and related impacts to salinity control, water quality, and erosion. A comprehensive inventory of the condition of soil resources has not been conducted across the planning area, although rangeland health assessments and other site-specific project monitoring reports may contain some of this kind of information. This section provides an overview of the general soil resource concerns in the RFO.

Soil management problems may arise in the lands managed by the RFO depending on a combination of factors, including soil type, climate, geologic setting, vegetative cover, and how the resources are affected by multiple uses (e.g., recreation, mineral development, grazing). Vegetation is sparse in some of the planning area because of high salinity, a short growing season, and distribution of effective moisture in some soils. Erosion and compaction are two important factors of concern in the planning area. Several areas in the planning area contain soils that are considered to be highly susceptible to wind and water erosion.

Vehicle traffic, herbivore trampling, foot traffic, or any activity that repeatedly causes an impact on the soil surface can cause a compaction layer (Chanasyk and Naeth 1995, Cole 1985, and Thurow *et al.* 1988). Compaction becomes a problem when it begins to limit plant growth, water infiltration, or nutrient cycling processes (Wallace 1987, Willat and Pullar 1983, Thurow *et al.* 1988, Hassink *et al.* 1993). Moist soil is more easily compacted than dry or saturated soil (Hillel 1998).

Soils developed on marine formations are high in gypsum and other salts. High concentrations of these salts at or near the soil surface limit the types and amounts of vegetation present. Badland and gypsum land, which are natural sources of large amounts of salt and sediment, often lack significant vegetation cover but frequently have a thin protective layer, such as rock fragments and/or soil crusts (physical and/or cryptobiotic) that provide some stability. Surface disturbance in these areas may increase the potential for erosion.

Biological soil crusts can be an important ecological component of the stability of certain soil and plant communities. Areas in the eastern portion of the RFO on the Colorado Plateau contain biological soil crusts as a component of the community. There are no inventories of the spatial extent or the condition of the soil crusts within the RFO. The standards and guidelines portion of the Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration (43 CFR Subpart 4180) and Utah's *Standards for Rangeland Health and Guidelines for Management* (BLM 1997) compare current soil crust cover to that identified in the ecological site descriptions to determine if current management strategies are meeting standards.

Salt and sediment yield is of major concern in the Colorado River Basin, and erosion from public lands is an important source of sediment and associated salts in the area. Some of this yield is natural or results from relatively stable conditions in an arid or semiarid climate with periodic high-intensity storms and active erosion. The actual contribution of salt and sediment yield to the total Colorado River Basin from drainages in the planning area is unknown. The Colorado River Salinity Control Act guides actions in watersheds of the Colorado River Basin.

3.3.3 Water Resources

The United States is divided and subdivided into successively smaller hydrologic units classified into 4 levels: regions, subregions, accounting units, and cataloging units. In general terms, a hydrologic unit can be defined as any geographic area containing water that naturally drains to a specific outlet. The hydrologic units are arranged within each other from the smallest (cataloging units) to the largest (regions).

The first level of classification divides the nation into major geographic areas, or regions. These geographic areas contain either the drainage area of a major river, such as the Upper Colorado River region, or the combined drainage areas of a series of rivers, such as the Texas-Gulf region, which includes a number of rivers draining into the Gulf of Mexico. The second level of classification divides the regions into subregions. A subregion includes the area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s), or a group of streams forming a coastal drainage area. The third level of classification subdivides many of the subregions into accounting units, and the fourth level of classification is the cataloging unit, which is the smallest element in the hierarchy of hydrologic units. A cataloging unit, which is roughly equivalent to a local watershed, is a geographic area representing part or all of a surface drainage basin, a combination of basins, or a distinct hydrologic feature (U.S. Geological Survey [USGS] no date).

The planning area lies within portions of 11 separate watersheds located in the Upper Colorado Hydrologic Region and the Great Basin Hydrologic Region. The RFO is located within both the Colorado River Hydrologic Basin and the Great Basin Hydrologic Region. The Henry Mountains portion of the RFO is located in the Upper Colorado River Sub-basin of the Colorado River Basin, whereas most of the Mountain Valley portion of the RFO is located in the Sevier River Sub-basin of the Great Basin Hydrologic Region. The northernmost portions of the RFO are contained in the Jordan River/Utah Lake Sub-basin of the Great Basin, and the easternmost extent of the Mountain Valley area is located in the Upper Colorado River Sub-basin. The RFO encompasses 120 perennial streams (Table 3-1) and a larger number of intermittent streams.

Table 3-1. Perennial Stream Segments—Richfield Field Office

Antimony Creek	Ax Handle Canyon Creek	Beaver Creek
Benson Creek	Big Hollow Creek	Birch Creek
Box Creek	Brimhall Springs Creek	Brine Creek

Thompson Creek	Threemile Creek	Ticaboo Creek
Timber Canyon Creek	Trachyte Creek	Twin Corral Box Canyon
Water Creek	Water Hollow Creek	Wild Horse Creek
Willow Patch Creek	Willow Spring Creek (Forest Creek)	Yogo Creek

The majority of the streams in the RFO, whether perennial or intermittent, originate at higher elevations on National Forest or BLM lands and flow through private and BLM-administered lands. Many of these streams are characterized by steep streambed gradients and are subject to flooding during rapid snowmelt or high-intensity thunderstorms. As the perennial streams run through public lands, they provide water for livestock, wildlife, fisheries, and downstream irrigation.

Some intermittent and ephemeral streams in the area yield water during periods of spring snowmelt or intense thunderstorm activity. However, much of the water in most of these streams is used for irrigation and does not reach the major rivers.

The Sevier River and its tributaries are regulated by storage reservoirs. Because of this, the Utah State Engineer must approve changes to any water regime. A considerable amount of water from the snowmelt period is stored and then released from July to September. Lakes and reservoir storage facilities are an

important part of the water resource scheme. Major reservoirs in the area include Otter Creek, Koosharem, Piute, Willow Creek, Gunnison, and Sevier Bridge Reservoirs.

Springs, seeps, and wells in the area provide high-quality water for domestic and livestock use.

3.3.3.1 Water Quality

Baseline surface water quality within the planning area is influenced by the geology and soil with which the water has been in contact. Water quality also varies depending on flow conditions. Human-induced impacts in the planning area, such as changes in thermal and turbidity conditions in water bodies and impacts from increased salinity, heavy metals, and nutrients from irrigation or other discharges also affect baseline water quality. Surface water quality impacts within the planning area may be associated with agricultural runoff, road maintenance, removing riparian vegetation, channel modification, stream bank destabilization, atmospheric deposition, resource extraction, oil and gas activities, urban runoff, and grazing activities.

Table 3-2 lists the impaired stream and river segments located within the RFO, listed on Utah's 2006 303(d) list of impaired waters (Appendix 4). Table 3-3 lists the lakes and reservoirs located within the planning area needing total maximum daily load (TMDL) analysis. TMDL is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards, and an allocation of that amount to the pollutant's sources. The State sets water quality standards. The State identifies the uses for each water body, for example, drinking water supply, contact recreation (swimming), and aquatic life support (fishing), and the scientific criteria to support that use. A TMDL is the sum of the allowable loads of a single pollutant from all contributing point and non-point sources. The calculation must include a margin of safety to ensure that the water body can be used for the purposes that the State has designated. The calculation must also account for seasonal variation in water quality. The Clean Water Act (CWA), Section 303, establishes the water quality standards and TMDL programs.

Table 3-2. Utah's 2004 303(d) List of Impaired Stream and River Segments Requiring a TMDL Analysis

Water Body Name	Water Body Description	Causes
East Fork Sevier River	East Fork Sevier River and tributaries from confluence with Sevier River upstream to Antimony Creek confluence, excluding Otter Creek and tributaries	Temperature Total phosphorus
Lost Creek	Lost Creek and tributaries from confluence with Sevier River upstream about 6 miles	Total Dissolved Solids (TDS)
Sevier River	Sevier River from Clear Creek confluence to HUC unit boundary	Temperature
Peterson Creek	Peterson Creek and tributaries from confluence with Sevier River to USFS boundary	TDS
Lower Ivie Creek	Ivie Creek and tributaries from confluence with Muddy Creek to U-10 highway	TDS
San Pitch River	San Pitch River and tributaries from beneficial U132 to Pleasant Creek confluence excluding Cedar Creek, Oak Creek, Pleasant Creek, and Cottonwood Creek	Temperature
Lower Muddy Creek	Muddy Creek from confluence with Fremont River to Ivie Creek confluence	Selenium

Table 3-3. Lakes and Reservoirs within Planning Area Identified as Needing TMDL Analysis

Water Body Name	Water Body ID	Pollutant
Piute Reservoir	UT-L-16030001-011	Total phosphorus
Nine Mile Reservoir	UT-L-16030004-001	Total phosphorus Dissolved oxygen
Otter Creek Reservoir	UT-L-16030002-004	Total phosphorus
Koosharem Reservoir	UT-L-16030002-011	Total phosphorus

Source: UDEQ 2006

As surface water quality decreases, the ability of aquatic animals and plants to maintain themselves diminishes. Stressors associated with increasing temperatures, lower dissolved oxygen levels, changing pH, and smothering from sediments adversely affect the aquatic ecosystem and diminish the ability of surface waters to sustain baseline conditions.

3.3.3.2 Drinking Water

Several municipal water sources and associated watersheds originate on public lands. BLM coordinates with local communities to protect and allow appropriate development of municipal water resources. Table 3-4 lists the culinary water sources located on public lands within the planning area.

Table 3-4. Culinary Water Sources on Public Lands

3.3.3.3 Groundwater

Groundwater recharge primarily originates as precipitation in the mountain areas surrounding the planning area where geologic formations outcrop or where water resources were deposited during past geologic periods. Groundwater quality is highly variable and dependent on the formations where the aquifers are located. Groundwater contamination is a concern. Fresh water in the Navajo Formation is contaminated with high levels of TDS adjacent to Muddy Creek.

3.3.4 Vegetation

Vegetation communities provide the foundation for many resources and resource uses on public lands. Plant communities provide habitat for wildlife, provide forage for livestock, influence recreation use, and are components of scenic quality. Healthy vegetation communities stabilize soils, increase infiltration of precipitation, slow runoff, reduce erosion, and enhance visual quality.

Soil, climate, topography, and disturbance influence patterns of vegetation structure and species composition. Disturbances (such as fire) influence the structure and species composition of vegetation communities. Increases in the interval between fire disturbances in nearly all vegetation communities have resulted in increased vegetation density and change in vegetation structure and species composition.

The vegetation community and association descriptions that follow refer to the combination of plants forming natural vegetation in an area. These descriptions combine Utah Land Cover Geographical Analysis Program (GAP) data into 3 broad categories: desert shrub, sagebrush steppe, or forest and woodlands (USGS 2004). Each category contains one or more vegetation community or association, as illustrated in Map 3-3, Vegetation Cover Types. The vegetation associations are defined by the dominant plant species of either the tree or shrub vegetation layer (Jennings *et al.* 2004). The primary vegetation associations within the lands managed by the RFO are desert shrub, pinyon-juniper woodlands, sagebrush steppe, ponderosa pine, mixed-conifer, oak, mountain shrub, aspen, and nonvegetated. Table 3-5 lists the acreage and percentage of each vegetation association in the RFO.

Table 3-5. Vegetation Communities and Associations

Vegetation Community and Association	Richfield Field Office	
	Acres	Percentage
Desert shrub	1,051,000	49%
Pinyon-juniper woodlands	552,000	26%
Sagebrush steppe	337,000	16%
Ponderosa pine	43,000	2%
Mixed-conifer	29,000	1%
Oak	20,000	1%
Mountain shrub	16,000	1%
Aspen	12,000	<1%
Nonvegetated	67,000	3%
Total	**2,127,000**	**100%**

Source: USGS 2004

3.3.4.1 Desert Shrub

Desert shrub includes the salt shrubs: shadscale, greasewood, blackbrush, and desert grassland vegetation cover types (see Table 3-6). Desert shrub vegetation comprises nearly half of the RFO (1,051,000 acres), including much of the lower elevation public land mostly east of Capitol Reef National Park. This is the largest vegetation community in the RFO. Located primarily on the valley floors, this vegetation community is most common on well-drained, sandy to rocky soils. It can, however, tolerate saline and alkaline soils. Plants within this community are adapted to a wide temperature range, and many are

capable of photosynthesis at temperatures as low as 11°F (Simonin 2001). Precipitation in these areas ranges from 6 to 14 inches annually but is mostly from 8 to 12 inches per year. Table 3-6 lists species prevalent in this vegetation community.

Wildlife and livestock use of desert shrub vegetation varies depending on the species present. Fourwing saltbush is very palatable and provides high-quality forage for wildlife and livestock even during drought conditions (Kindschy 1996). Black greasewood is a valuable browse for livestock and wildlife, particularly during fall and winter; however, when consumed in large quantities, the soluble oxalates that black greasewood contains are poisonous to livestock (Anderson 2004). The forage value for blackbrush is principally as browse for bighorn sheep. Domestic sheep and goats, and to a lesser extent cattle, also browse blackbrush. During the winter in southwestern Utah, blackbrush provides fair forage for domestic sheep and cattle (Anderson 2001). Desert shrub areas provide browse and shelter for small mammals, and fourwing saltbush provides a source of water for black-tailed jackrabbits.

Table 3-6. Typical Desert Shrub Plant Species

Life form	Common Name	Scientific Name
Shrubs	Shadscale	Artiplex confertifolia
	Winterfat	Krascheninnikovia lanata
	Saltcedar	Tamarix chinensis
	Rabbitbrush species	Chrysothamnus spp.
	Hopsage	Grayia spinosa
	Mormon Tea	Ephedra spp.
	Blackbrush	Coleogyne ramosissima
	Black Greasewood	Sarcobatus vermiculatus
	Fourwing Saltbush	Artiplex canescens
Grasses	Indian Ricegrass	Achnatherum hymenoides
	Galleta	Hilaria jamesii
	Alkali Sacaton	Sporobolus airoides
	Saltgrass	Distichlis spicata
	Purple Threeawn	Aristida purpurea
	Blue Grama	Bouteloua gracilis
	Sand Dropseed	Sporobolus cryptandrus
	Cheatgrass	Bromus tectorum
Forbs	Broom Groundsel	Senecio spartioides
	Hairy Daisy	Erigeron incertus
	Longleaf Phlox	Phlox longifolia
	Scarlet Globemallow	Sphaeralcea coccinea

3.3.4.2 Sagebrush Steppe

Widely distributed in the Colorado River Basin and Great Basin, the sagebrush-steppe vegetation community is primarily found in the western portion of the RFO. Sixteen percent (337,000 acres) of the RFO is considered sagebrush steppe. Sagebrush steppe communities generally occur on the drier portions of pinyon-juniper woodlands and mesic portions of the desert shrub community. Precipitation in these areas averages 8–15 inches per year, and soils are dry, with a thin organic horizon. Forbs with shallow root systems are favored in wetter years, whereas deeply rooted shrubs have the competitive advantage during droughts and survive by tapping deeply infiltrated moisture (West 2000). Sagebrush species include big sagebrush, Wyoming big sagebrush, and basin sagebrush. Table 3-7 lists species in the sagebrush steppe vegetation community. Sagebrush steppe communities in Utah have declined because of drought, changes in disturbance regimes, and the invasion of cheatgrass and other invasive plant species. A recent sagebrush die-off in Utah affected approximately 600,000 acres of sagebrush habitat below 7,000 feet, primarily on public lands. The die-off was attributed to stress on the plants caused by an extended drought. In addition, most of the sagebrush in the RFO are mature plants, with little new growth being found.

About 100 bird species and 70 mammal species are found in sagebrush steppe communities. These species can be grouped into sagebrush obligates (e.g., sage-grouse, sage thrasher, sage sparrow, Brewer's sparrow, pygmy rabbit, sagebrush vole, sagebrush lizard, and pronghorn); shrubland species (e.g., green-tailed towhee, black-throated sparrow, and lark sparrow); and shrubland-grassland species (e.g., Swainson's hawk, ferruginous hawk, prairie falcon, sharp-tailed grouse, and loggerhead shrike).

Table 3-7. Typical Sagebrush Steppe Plant Species

Life form	Common Name	Scientific Name
Shrubs	Rabbitbrush species	Chrysothamnus spp.
	Broom Snakeweed	Gutierrezia sarothrae
	Shadscale	Artiplex confertifolia
	Antelope Bitterbrush	Purshia tridentata
	Fringed Sagebrush	Artemisia frigida
	Wyoming Sagebrush	Artemisia tridentata wyomingensis
	Basin Big Sagebrush	Artemisia tridentata vaseyana
	Fourwing Saltbush	Artiplex canescens
Grass	Indian Ricegrass	Achnatherum hymenoides
	Bluebunch Wheatgrass	Pseudoroegneria spicata
	Crested Wheatgrass (non-native)	Agropyron cristatum)
	Desert Needlegrass	Achnatherum speciosum
	Basin Wildrye	Leymus cinereus
	Poa species	Poa spp.
	Salina Wildrye	Leymus salinus
	Slender Wheatgrass	Elymus trachycaulus
	Cheatgrass	Bromus tectorum
Forbs	Yarrow	Achillea millefolium

Life form	Common Name	Scientific Name
	Arrowleaf Balsamroot	Balsamorhiza sagittata
	Scarlet Globemallow	Sphaeralcea coccinea
	Desert Phlox	Phlox tenuifolia
	Pricklypear Cactus	Opuntia spp.
	Fleabane species	Erigeron spp.
Mosses and Lichens	Awnless Spikemoss	Selaginella mutica

3.3.4.3 Forests and Woodlands

Forest and woodland vegetation is generally restricted to areas where soil moisture is adequate to establish seedlings or where the disturbance regime has changed. Adequate soil moisture is usually found at higher elevations and in riparian areas. Forest species usually dominate areas above 7,000 feet. Pinyon-juniper woodlands dominate lower elevations with adequate soil moisture. Typical forest and woodland types found within the RFO are ponderosa pine (*Pinus ponderosa*), aspen (*Populus spp.*), mixed-conifer, and pinyon-juniper woodlands. Forested areas above 10,000 feet elevation are usually a mix of several conifer species. At the lower elevations, forest types vary from pure juniper to a mix of woodland species and ponderosa pine. Table 3-8 lists species commonly found in forest and woodland areas.

Table 3-8. Typical Forest and Woodland Species

Life form	Common Name	Scientific Name
Trees	Utah Juniper	Juniperus osteosperma
	Rocky Mountain Juniper	Juniperus scopulorum
	Pinyon Pine	Pinus edulis
	Singleleaf Pinyon	Pinus monophylla
	Ponderosa Pine	Pinus ponderosa
	Bristlecone Pine	Pinus longaeva
	Engelmann Spruce	Picea engelmannii
	Subalpine Fir	Abies lasiocarpa
	White Fir	Abies concolor
	Douglas Fir	Psuedotsuga menziesii
	Aspen	Populus tremuloides
	Curleaf Mountain-Mahogany	Cercocarpus ledifolius
Shrubs	Greenleaf Manzanita	Arctostaphylos patula
	Black Sagebrush	Artemisia nova
	Gambel Oak	Quercus gambelii
	Mountain Snowberry	Symphoricarpus oreophilus
	Serviceberry species	Amelanchier spp.
	Chokecherry	Prunus virginiana

Life form	Common Name	Scientific Name
	Oregon Grape	Berberis repens
	Wood's Rose	Rosa woodsii
	Myrtle Pachistima	Pachistima myrsinites
	Redberry Elder	Sambucus racemosa
	Gooseberry species	Ribes spp.
	Mountain Muhly	Muhlenbergia montana
Grasses	Idaho Fescue	Festuca idahoensis
	Sheep Fescue	Festuca ovina
	Mutton Grass	Poa fendleriana
	Blue Grama	Bouteloua gracilis
Forbs	Littleleaf Pussytoes	Antennaria parviflora
	Heartleaf Arnica	Arnica cordifolia
	Indian Paintbrush species	Castilleja spp.
	Lupine species	Lupinus spp.

Source: USFS 2004 and Welsh et al. 2003.

Pinyon-Juniper

Pinyon-juniper woodlands occupy the driest woodland sites in Utah and provide important resources for people, wildlife, and plants. Pinyon-juniper woodland communities cover 552,000 acres—about one-quarter of the RFO. Pinyon-juniper stands grow on foothills, low mountains, mesas, and plateaus ranging from 3,000 to 8,000 feet in elevation, depending on precipitation and soil conditions. The upper limits of the pinyon-juniper woodland community in Utah are 6,500 feet on north-facing slopes and 8,400 feet on south-facing slopes. Plant species present in these areas vary widely (Evans 1988). Typically, juniper dominates at lower elevations and pinyon dominates at higher elevations (Anderson 2002, Zlatnik 1999). Pinyon-juniper woodlands provide little forage for livestock and big game.

Pinyon-juniper woodlands are increasing in the western United States as they replace other vegetation communities. Juniper is expanding into open meadows, grasslands, sagebrush steppe communities, quaking aspen groves, riparian communities, and forest lands. Increases in canopy cover results in significant amounts of bare ground, litter, and desert pavement at the soil surface (USGS 2004). On lower edges of the woodland zone, Utah juniper is frequently the only tree species. Utah juniper is more adapted to dry conditions than pinyon, with junipers often serving as nurse trees for pinyons in well-developed forests. The undergrowth is variable and dependent upon canopy closure, soil texture, elevation, and aspect (Welsh *et al.* 2003). In healthy pinyon and juniper communities, height ranges from 15 to 30 feet. Health and relative density of pinyon and juniper vary widely within the RFO; however, canopy densities over 50 percent occur over large areas. Pinyon pine and Utah juniper vigorously compete with other plants for available soil water. They crowd out grasses and shrubs that usually are present as understory vegetation. The lack of protective vegetative cover in pinyon and juniper stands leaves the soil surface particularly susceptible to erosion.

The replacement of shrub steppe communities with juniper woodland is attributed to the reduced role of fire caused by the reduction of the fine fuels through livestock grazing (Miller and Rose 1995). A combination of climatic changes, fire suppression, and the removal of understory vegetation has facilitated this expansion of pinyon-juniper woodlands.

Ponderosa Pine

Ponderosa pine forest types within the RFO (Map 3-3) are found primarily in the Henry Mountains and bordering USFS lands in the western portion of the RFO. Ponderosa pine can be either a climax or a seral species. It is a climax species at the lower limits of the coniferous forests and a seral species in higher elevation mixed-conifer forests. Ponderosa pine is considered shade intolerant and tends to grow in even-aged stands; however, in the drier limits of its range, such as the Henry Mountains, uneven-aged stands appear common. In reality, these apparently uneven-aged ponderosa pine stands are a mosaic of small even-aged groups. Ponderosa pines lose vigor in dense stands (Burns and Honkala 1990).

Fires have had a profound effect on the distribution of ponderosa pine. Although the seedlings are readily killed by fire, larger trees possess thick bark that offers effective protection from fire damage. Competing tree species, such as Douglas fir, are considerably less fire tolerant, especially in the sapling and pole size classes. Because of successful fire control during the past 50 years, many of these stands have developed understories of Douglas fir and true firs. Type conversion has been accelerated by harvest of the ponderosa pine, leaving residual stands composed of true fir, Douglas fir, or lodgepole pine (Burns and Honkala 1990).

Quaking Aspen

Quaking aspen is found on relatively moist sites between 7,500 and 10,500 feet in mountainous areas within the planning area. It also grows at lower elevations in riparian communities and at other sites with deep soil and adequate soil moisture. In very high exposed places, aspen becomes stunted, with the stem bent or almost prostrate from snow and wind. At its lower elevation limit, it is a scrubby tree growing along creeks (Burns and Honkala 1990). Aspen trees grow together in clones or in groups of stems that share the same root system and genetic makeup. Quaking aspen seedlings at 1 year of age are capable of reproducing by root sprouts (suckers), and mature stands reproduce vigorously by this means. Root collar sprouts and stump sprouts are produced only occasionally by mature trees, but saplings commonly produce them (Burns and Honkala 1990). Aspen clones may regenerate readily after clearcutting or burning by producing numerous root sprouts. Root damage during logging can reduce sprouting. Clearcutting of a mixed aspen-conifer stand may lead to replacement with pure aspen stands, depending on location. This forest type is very important for landscape diversity, aesthetics, and wildlife habitat.

The fast-growing quaking aspen tree is short–lived, and pure stands are gradually replaced by slower growing species. Areas once dominated by aspen in the State of Utah have decreased by 60 percent since the late 1800s (Shepperd *et al.* 2001). The diversity and abundance of understory plants in an aspen stand can be 10 times that found in coniferous forest types. In addition, aspen forests yield more water than conifer types in similar environments.

Spruce-Fir

Spruce-fir forest types within the planning area occur at the highest elevations, usually above 10,000 feet. These forest types include Douglas fir, subalpine fir, and Englemann spruce. Spruce-fir forests can be very complex in structure and age distribution. Their species are shade tolerant and generally not considered resistant to fire. Fires are infrequent but important in dry years, and windthrow is a prime disturbance factor.

3.3.4.4 Riparian Resources

The BLM's 1987 policy statement on riparian area management defines a riparian area as "an area of land that is directly influenced by permanent water. It has visible vegetation or physical characteristics reflective of permanent water influence. Lake shores and stream banks are typical riparian areas. Excluded are such sites as ephemeral streams or washes that do not exhibit the presence of vegetation

dependent upon free water in the soil." A riparian area identified as lentic is usually a meadow/spring riparian area whereas a riparian area identified as lotic has running water such as a creek or river.

Riparian areas cover less than 1 percent of the planning area. The most extensive areas of riparian vegetation on public land are those found along the Dirty Devil River and the Fremont River east of Capitol Reef National Park. The ecological significance of riparian areas far exceeds their limited physical area. They are located along streams and rivers or lands with a water table that is capable of influencing soils and vegetation. They are major contributors to ecosystem productivity and structural and biological diversity, and they provide important habitat for fish, birds, and other wildlife species. Riparian areas affect the quantity and quality of water onsite and downstream, and help store floodwaters, recharge groundwater, reduce the risk of flash floods, and filter sediments.

The objective of the Utah BLM Riparian Policy is to improve or maintain riparian areas in proper functioning condition (PFC). Regardless of the type of riparian or wetland ecosystem, functioning condition is assessed for each stream or varying segments. Functioning condition is rated by category to reflect ecosystem health as affected by management practices. Riparian areas are classified as in PFC when there is adequate vegetation and landform structure present to dissipate stream energy from high flows. This results in a reduction in erosion, improvement in water quality, filtration of sediment, capturing of bedload, and an aid in floodplain development. Properly functioning riparian areas also improve flood water retention and ground water recharge, promote development of root masses that stabilize stream banks against cutting action, promote development of diverse ponding and channel characteristics necessary for fish production and other uses, and support greater biodiversity.

"Functioning at Risk" riparian areas are in functional condition, but at least one soil, water, or vegetation attribute makes them susceptible to degradation following high flow events. Management practices that can make them "At Risk" include livestock grazing, the presence of roads, off-highway vehicle (OHV) activities, and commercial recreation and development.

"Non-Functioning" riparian areas are clearly not providing adequate vegetation, landform, or large wood debris to dissipate stream energy associated with high flows, and thus are not reducing erosion, improving water quality, etc.

BLM has inventoried riparian areas throughout the RFO. About 455 miles of lotic riparian habitat and 1,423 acres of lentic riparian habitat have been inventoried on public lands in the RFO. The BLM has completed a condition assessment of all inventoried riparian areas in allotments. All riparian areas in allotments were inventoried in the early 1990s. More recently, under the *Utah Standards and Guidelines for Rangeland Health,* the BLM expanded the definition for riparian areas to include seeps and springs. To date, approximately 59 percent of riparian areas under the more comprehensive definition have been inventoried. Estimates of functional conditions of these riparian areas are displayed in Table 3-9. It should be noted that this does not represent a comprehensive total of riparian habitats within the RFO because not all have been surveyed. Utah's *Standards for Rangeland Health* (BLM 1997) establish PFC as the minimum standard for BLM management of riparian areas.

Table 3-9. Riparian Conditions Inventory

		Proper Functioning Condition	Functioning-At-Risk				Non-Functional	Total
			Trend Up	Trend Not Apparent	Trend Down	Total		
Lotic Riparian	Miles	305 mi	30 mi	61 mi	11 mi	102 mi	48 mi	455 mi

		Proper Functioning Condition	Functioning-At-Risk				Non-Functional	Total
			Trend Up	Trend Not Apparent	Trend Down	Total		
	% surveyed	67%	7%	13%	2%	22%	11%	
Lentic Riparian	Acres	1,236 ac	16 ac	137 ac	10 ac	163 ac	24 ac	1,423 ac
	% surveyed	87%	1%	10%	1%	11%	2%	

*Source: Riparian Inventories, Richfield Field Office, 2008

Riparian areas are dynamic and, compared with upland habitats, extremely responsive to changes. Variations in seasonal water flows influence the productivity and density of riparian vegetation and channel development. Flooding is an essential part of system development and stability. Minor changes are normal and are part of the resilience of the riparian ecosystem. A system's ability to withstand major disturbances depends on the integrity and balance of stream bank, hydrology, and vegetation components. Degraded conditions in any of those components can result in impacts that may be beyond the riparian area's capacity to withstand or repair following disturbance. The combined effects of small-scale, repeated degradation without recovery cause incremental declines in functional condition and increase vulnerability to further degradation. It is BLM policy to maintain, restore, or improve riparian ecosystems to achieve a healthy and properly functioning condition that ensures biological diversity, productivity, and sustainability.

Riparian areas depend on a balanced combination of physical (stream bank, channel, and soil characteristics), hydrologic (regular occurrence of surface water), and vegetation (hydrophytic communities) components. When any of these 3 components—soils, water, or vegetation—are adversely affected, the functional capacity of a riparian habitat may degrade. Riparian-wetland areas are properly functioning when adequate vegetation, landform, or large woody debris is present to dissipate stream energy associated with high water flows and flooding, thereby reducing erosion and improving water quality. Deep soil-binding root masses stabilize stream banks against erosion.

3.3.4.5 Invasive, Non-native Species

The BLM defines a weed as "a plant that interferes with management objectives for a given area of land at a given point in time" (BLM 2007b). Noxious weeds are designated by federal or state law as generally possessing one or more of the following characteristics: aggressive and difficult to manage; parasitic; a carrier or host of serious insects or disease; or non-native, new, or not common to the United States. Noxious weeds are defined in Utah's *Standards for Rangeland Health and Guidelines for Livestock Grazing* (BLM 1997) as non-native plants that are especially undesirable because they have no forage value and are sometimes toxic, or are capable of invading plant communities and displacing native species. The BLM recognizes noxious weed invasions as one of the greatest threats to the health of rangelands nationwide.

Invasive species include plants able to establish on a site where they were not present in the original plant composition. Invasive species aggressively out-compete native species within a community and often alter the physical and biotic components enough to affect the entire ecological community. Invasive species are of particular concern following a disturbance. They are often exotic species that do not have naturally occurring, local predators.

Although the invasive weed species occur throughout the RFO, most infestations are small and sparsely scattered through Sevier, Piute, Garfield, and Wayne counties. The areas with the highest noxious weed

concentration occur in the Sanpete County portion of the planning area. Due to weed treatments over the past 25 years, infestations are small and localized; and they are treated as soon as they are identified. Cheatgrass is located throughout the planning area and is generally most prevalent below 8,000 feet. There are several small areas of cheatgrass monoculture throughout the planning area, generally in areas post wildfire, or post grasshopper invasion. Additionally, some areas have higher concentrations of cheatgrass due to historic vegetative disturbance.

The Utah Noxious Weed Act defines a noxious weed as any plant that is determined by the Commissioner of Agriculture to be especially injurious to public health, crops, livestock, land, or other property. There are 19 species which have been designated as state noxious weeds, and 15 have been additionally classified as new and invading weeds that have the potential to become noxious weeds. The state noxious weed list is presented in Table 3-10.

Table 3-10. Utah Noxious Weeds

Common Name	Scientific Name
Bermudagrass	Cynodon dactylon
Bindweed (Wild Morning Glory) *	Convolvulus arvensis
Canada Thistle *	Cirsium arvense
Diffuse Knapweed *	Centaurea diffusa
Dyers Woad	Isatis tinctoria
Perennial Sorghum species including Johnsongrass (Perennial sorghum) *	Sorghum almum Sorghum halepense
Leafy Spurge	Euphorbia esula
Medusahead	Taeniatherum caput-medusae
Musk Thistle *	Carduus nutans
Perennial Peppergrass *	Lepidium latifolium
Purple Loosestrife	Lythrum salicaria
Quackgrass *	Agropyron repens
Russian Knapweed *	Centaurea repens
Scotch Thistle *	Onopordum acanthium
Spotted Knapweed	Centaurea maculosa
Squarrose Knapweed *	Centaurea squarrosa
Whitetop *	Cardaria draba
Yellow Star Thistle	Centaurea solstitialis

Note: Species marked with an asterisk (*) occur within the RFO. The remaining species have been identified on adjacent private, state, or USFS lands.
Source: Utah Department of Agriculture and Food 2003b.

In addition to the list generated by the State of Utah, each county weed control board has the authority to develop its own list. Table 3-11 lists weeds designated as noxious in any of the 5 counties within the planning area.

Table 3-11. County Noxious Weeds 2003

Common Name	Scientific Name	County Listed
Black Henbane	Hyoscyamus niger	Sanpete
Houndstongue	Cynoglossum officinale	Sanpete
Velvet Leaf	Abutilon theophrasti	Sanpete
Russian Olive	Elaeagnus angustifolia	Sevier, Wayne

Source: Utah Department of Agriculture and Food 2003b.

Utah BLM has designated several other invasive plants as new and invading weeds. These plants, although not listed by the State or any of the 5 counties, are identified based on their potential to invade and possibly alter plant communities in the RFO. Table 3-12 identifies these species.

Table 3-12. Utah BLM New and Invading Weeds

Common Name	Scientific Name
Black Henbane	Hyoscyamus niger
Camel Thorn	Alhagi camelorum
Dalmatian Toadflax	Linaria dalmatica
Goatsrue	Galega officinalis
Jointed Goatgrass	Aegilops cylindrica
Poison Hemlock	Conium maculatum
Purple Starthistle	Centaurea calcitrapa
Silverleaf Nightshade	Solanum elaeagnifolium
St. John's Wort	Hypericum perforatum
Velvetleaf	Abutilon theophrasti
Water Hemlock	Cicuta douglasii (C. maculata)
Wild Proso Millet	Panicum miliaceum
Yellow Nutsedge	Cyperus esculentus
Yellow Toadflax	Linaria vulgaris

Source: BLM 2004b.

Finally, the RFO has identified 4 invasive species in addition to the state, county, and Utah BLM plants. These additional species, which are known to cause problems within the local plant communities in the RFO, are:

- Puncture vine, which is also known as Goat's head (*Tribulus terristris*)
- Salt cedar, which is commonly referred to as tamarisk (*Tamarix chinensis* or *T. ramosissima*)
- Small flowered tamarisk (*Tamarix parviflora*)
- Buffalobur (Solanum rostratum).

Russian knapweed (*Centarea repens*), salt-cedar (*Tamarix chinensis*), and Russian olive (*Elaeagnus angustifolia*) are all problematic species occurring in riparian areas of the RFO. Salt-cedar channelizes rivers with its deep roots and chokes out other vegetation.

The foregoing lists are changed as new plant species become problems. It should be noted that a species' absence from the lists does not mean that the species is not considered in management decisions. For example, although large areas of uplands and rangelands are being converted to invasive annual species, including cheatgrass (*Bromus tectorum*) and Russian thistle (*Salsola tragus*), neither species is included in any of the above lists. Once cheatgrass has established on a site and gone through a couple of cycles of seed production and dispersal, the seed bank can contain 2 or 3 times as many viable cheatgrass seeds as there are established plants in the community (Zouhar 2003). Cheatgrass invasion may be accelerated by disturbance, but disturbance is not required for its establishment. Cheatgrass can also thrive in areas that have little or no history of cultivation or grazing by domestic livestock. It may establish in these relatively undisturbed areas when seed disperses from nearby patches and establishes on sites of small natural disturbances, such as where rodents or predators dig in the soil (Zouhar 2003). It has changed plant species composition in all 3 vegetation communities.

3.3.5 Cultural Resources

Overviews of known cultural resources in the RFO show a wide range of and potential for cultural resources. Cultural resource inventories have been conducted in the lands managed by the RFO for more than 30 years at varying levels using a variety of methods. Most of the inventories were conducted in accordance with Section 106 of the National Historic Preservation Act (NHPA) as part of impact mitigation from surface disturbing activities, although academic institutions have performed some research excavations. Inventories have identified several thousand cultural properties throughout the RFO, representing a wide variety of site types and chronological periods. Overall, less than 5 percent of the RFO has been inventoried.

Compared with other areas in the Southwest, site densities in inventoried areas are low throughout the RFO. Site densities increase near Capitol Reef National Park and in some of the canyons in eastern Wayne and Garfield counties. Site densities are much lower in Sevier County, with the lowest densities being found in Sanpete and Piute counties. Known cultural resources include various site types ranging in age from about 10,000 years ago through the present. The site types are listed and described below.

3.3.5.1 Site Types

Cultural resources in the RFO have been classified according to one or more site types. Site types are groupings of sites with similar physical or cultural characteristics. During original recordation, sufficient information may not have been readily available to determine the functional or cultural site type. Consequently, some sites may be recategorized after further research. Sites fitting into more than one category are usually more complex and have more information potential than do single-category sites. At the broadest level, cultural resources sites are categorized as either prehistoric or historic types.

Prehistoric Site Types

Prehistoric sites can be associated with one or more of 4 broad thematic periods: Paleo-Indian, Archaic, Formative (Fremont or Anasazi), and Late Prehistoric. There are sites within the RFO from each period, with an especially large representation of Formative sites. Some of the site types in the RFO are as follows:

- **Rock Art.** Rock art can be of two types, petroglyphs and pictographs. Petroglyphs are designs pecked or incised into the surface of the rock; pictographs are painted on the rock surface with various shades of pigment. At some sites, designs have been pecked into the rock and then painted; at other sites, images were painted, then features were created by pecking away the paint and the rock surface. Rock art has not been attributed to specific human groups with any degree of assurance, but it is believed that rock art within the RFO represents groups living from before 9000 B.C. to the present.
- **Rockshelter.** A rockshelter consists of a rock outcrop or large boulder that provides shelter from wind, sun, rain, and other elements. Rockshelters were used by both prehistoric and historic people.
- **Lithic Scatter.** A lithic scatter is any group of stone artifacts or artifact fragments. Lithic scatters are usually composed of flaked stone tools or debitage. Ground stone tools and tool fragments also fit into this category. This type ranges from sites with only a single tool present to sites with thousands of artifacts, diverse in type and function.
- **Ceramic Scatter.** A ceramic scatter is any group of ceramic artifacts or artifact fragments and can result from either prehistoric or historic activity. Most prehistoric ceramics represent the Fremont Indian culture or tradeware from the Anasazi culture to the south, but a small amount of Numic (e.g., Ute or Paiute) pottery has been recorded.

- **Cairn.** A cairn is an intentionally created pile of stones. Most cairns in the RFO are from the historic period (e.g., sheepherders' monuments, mining claim markers, etc.). However, some may be prehistoric.
- **Hearth.** A hearth is the remains of a feature where humans purposely used fire. This includes clay- or rock-lined fire pits, ash pits, ash stains, and fire-cracked rock concentrations or scatters.
- **Rock Alignment.** A rock alignment is any human arrangement of rock not usually recognized as part of a structure.
- **Cist.** Cists are small structures usually built for storage. They are slab-lined or coursed masonry, generally about 1 meter in diameter. They are usually semi-subterranean but can occur on the surface, freestanding, or attached to a cliff face or ledge.
- **Burial.** Burial sites contain human physical remains below the surface or exposed, whether marked or not.
- **Structural.** These sites are constructed from a wide range of material types and include various features within the structure. They consist of structures of brush and trees, mud and sticks, coursed masonry, and slab-lined, boulder-lined, or unlined pits occurring in open or naturally protected areas.
- **Midden.** Middens are concentrations of all or several of the following: ash, charcoal, bone, sherds, lithic fragments, human excrement, and general garbage.

Historic Site Types

Historic sites are cultural resources with a period of significance ranging from 1700 A.D. to the present. Because features such as ditches, fences, and houses cannot be understood or interpreted outside the functional complex of which they are a part, historic resources are grouped into several themes. Some of these themes are organized chronologically, although most are functionally organized.

- **Anglo Exploration:** The pre-settlement category includes historic features from the period before the settlement of the 5 counties in the planning area. Limited features of this period have been identified. There are several records of individuals and groups passing through this area along what became known as the Old Spanish Trail. Remains of their activities may possibly be found. The Old Spanish Trail was designated a National Historic Trail in late 2002.
- **Ranching:** The ranching category includes features resulting from the raising of domestic livestock, such as fences, water developments, cabins, corrals, camps, and sheepherders' monuments. There is a long history of ranching in the RFO, and the features remaining from these developments are useful historic resources.
- **Farming:** The farming category includes features resulting from raising crops; digging or drilling wells; building barns, sheds, and cisterns; using farm implements; and constructing canals, ditches, and residences.
- **Mining:** The mining category includes features resulting from exploration and extraction of mineral resources, such as shafts and adits, drill sites, prospect holes, tailing dumps and waste rock piles, ore bins, loading chutes, kilns, tramways, residences, and other buildings.
- **Transportation:** The transportation category includes features resulting from attempts to transport people or goods across the RFO, such as abandoned rail lines, railroad grades, construction camps, bridges, roads, trails, and possible remains of river navigation.
- **Government Management:** The government management category includes features resulting from government attempts to manage the land and its resources. Many of these features are the result of Civilian Conservation Corps (CCC) activities through the 1930s. They include dams, fences, land treatments or manipulations, spring developments, roads, and bridges.

3.3.5.2 National Register of Historic Places

There are 3 sites within the lands managed by the RFO which have been formally listed on the National Register of Historic Places (NRHP). They are:

- **Cowboy Caves.** This site consists of two adjacent caves: Cowboy Cave and Walters Cave. Together they make up one of the richest archaic sites on the Colorado Plateau and outline almost 5,000 years of intermittent human habitation in the area.
- **Bull Creek Archaeological District.** This area of roughly 1,900 acres contains 104 identified significant archaeological sites, including habitations, storage structures, camps, and quarries. These sites represent a 400-year occupation (A.D. 800–A.D. 1200) of the area by peoples from the Formative period.
- **Starr Ranch.** The stone cabin here is a remnant of a 1890s stock-raising boom, when large cattle herds were introduced in the Henry Mountains. Starr Ranch is situated on the south slopes of Mount Hillers, and its stone buildings are still standing.

Many other sites throughout the RFO meet the eligibility criteria for NHRP listing. Current laws protect sites that are listed on the NHRP and those that are eligible for such a listing.

3.3.5.3 Cultural History Overview

Cultural resources in the RFO are categorized into two major time periods separated by the presence of European influence in the region. Prehistoric sites can be associated with one or more of 4 broad cultural periods that are distinguished based on differences in material culture traits or artifacts and subsistence patterns. Prehistoric sites can be associated with one or more of 4 broad thematic periods: Paleo-Indian (before 5500 B.C.), Archaic (5500 B.C. to 700 A.D.), Formative (700 A.D. to 1300 A.D.), and Late Prehistoric (1300 A.D. to ca. 1776 A.D.).

Paleo-Indian (Before 5500 B.C.)

There is no firm date for the earliest human use of the lands managed by the RFO; however, there is evidence of human use about 12,000 years ago. Chronologically, Paleo-Indians were contemporaries with extinct megafauna, and evidence outside the planning area shows the early human dependency on these animals (Spangler 2001). No sites that can definitely be assigned to this period have been found in the planning area, although many Paleo-Indian projectile points have been found throughout the Henry Mountains. Based on the period artifacts found throughout the area, it is safe to assume that Paleo-Indians did use the Henry Mountains; therefore, a potential for future discovery remains. Because of the rare nature of these resources, any discovery of Paleo-Indian sites would be significant.

Archaic (5500 B.C. to A.D. 700)

The Archaic tradition may be defined as a generalized hunter-gatherer adaptive strategy, with peoples employing “common adaptive strategies to exploit a variety of desert environments” (Spangler 2001). The warmer, dryer environment following the Paleo-Indian period resulted in a change from the big-game subsistence pattern of the Paleo-Indian to a small game hunting, seed, and nut-gathering subsistence pattern. It is thought that Archaic peoples “followed an annual round in response to changing resource availability, living in small, kin-related groups throughout most of the year” (Tipps 1988). These highly adaptive groups could easily move from where resources were depleted to where resources were abundant, roving from location to location, with their diet focusing on a new staple food source at each different location. Toward the end of the Archaic period, the hunter-gatherer tradition was gradually incorporated into supplemental agricultural subsistence. Evidence of agriculture exists in southern and southeastern Utah, dated to early Anasazi cultures around 1000 B.C. (Craig Harmon, BLM RFO, Personal

communication 2003). Archaic sites are common in the RFO. A few places in the area that were inhospitable to later Formative occupation seemed to favor earlier Archaic use.

Because these Archaic sociopolitical groups were small, the few seasonal cave and overhang dwellings thus far discovered are estimated to represent only a portion of the sites used. Potential for further Archaic site discoveries remains throughout the RFO.

Formative (A.D. 700 to A.D. 1300)

The Formative Period saw the continued growth of the Anasazi or ancestral Puebloan cultures in addition to the Fremont culture. Evidence of the Anasazi is limited to areas east of Capitol Reef National Park, and it does not extend much farther north than the Henry Mountains area. Archaeological evidence of the Fremont people is generally found north of the Puebloan areas throughout much of central and eastern Utah (Craig Harmon, BLM RFO, Personal communication 2003). Archaeological evidence from north of the Henry Mountains area contains evidence of the Fremont and Puebloan cultures.

Formative cultures led a more sedentary life than did their Archaic predecessors. Consequently, Formative cultures resulted in more permanent settlements. The Formative Fremont are "archaeologically characterized by the use of ceramics and the bow and arrow, habitation of deep pithouses in small riverine settlements, and a metate with a shelf, termed the Utah metate" (Miller 2002). Much of the rock art in the RFO is attributed to Formative cultures, although rock art from Archaic and Numic cultures also has been noted. Most sites in the RFO identified as belonging to a specific cultural group are either wholly from or contain components of Formative cultures.

Late Prehistoric (A.D. 1300 to ca. 1776)

Following the seemingly abrupt decline and disappearance of the Fremont culture around A.D. 1300, archaeological evidence suggests that Numic-speaking tribes (Paiute, Shoshone, Goshute) and the Navajo entered the area (Craig Harmon, BLM RFO, Personal communication 2003). According to the idea of Numic Expansion, suggested earlier in the 20th century, Late Prehistoric peoples used the bow and arrow and had pottery which significantly altered their hunting, food gathering, and food consumption practices from Archaic traditions. However, most records and diaries kept by the early settlers in Utah contain references to the many small farming communities that they encountered in the mid-19th century along the Virgin and Santa Clara rivers in southwestern Utah. This evidence seems to contradict the Numic Expansion theory. More research on this topic is necessary.

Sites from this period begin to be located in the planning area. They have probably been observed many times before but were ascribed to and recorded as Fremont.

Historic (After ca. 1776)

The first documented Europeans in Utah arrived in 1776–1777, led by the Spanish Catholic Fathers Dominguez and Escalante. Trappers, explorers, and emigrants passing through to the Pacific coast followed them. Between the early 1830s and the late 1840s, users of what is now known as the Old Spanish Trail navigated numerous routes, many of which cross portions of the RFO (NPS 2001). European settlement of the planning area ranged from 1848 in Sanpete County to the 1880s in Wayne County (Powell 1994) and was predominantly accomplished by Mormon pioneers. These early communities focused on farming and ranching for subsistence.

A gold and silver boom in the Tushar Mountains in the 1890s and early 20th century spawned several small towns in Piute County. When the mines were no longer productive, the population boom reversed itself. Later, lead, zinc, alunite, and uranium were mined (Powell 1994). Over the years, ranching has continued as a use of public lands. Although most historic period cultural resources in the 5 county area are not located on public land, there are exceptions, such as the Wolverton Historic Mill and Starr Ranch.

3.3.5.4 Cultural Relationships

Several tribes maintain active interests in use and management of the lands managed by the RFO. Continuing consultation efforts with these groups have identified a few areas of tribal religious significance and/or traditional use within the RFO. Tribes have also expressed concerns about the preservation and protection of specific archaeological sites and impacts to prehistoric sites from disturbance.

3.3.5.5 Cultural Resource Condition and Trend

The condition and trend of cultural resources in the RFO vary considerably as a result of the diversity of terrain, geomorphology, access and visibility, and past and current land use patterns. Because recorded sites are manifested by discovery of exposed artifacts, features, and/or structures, they are easily disturbed by natural elements such as wind and water erosion, natural deterioration and decay, as well as animal and human intrusion and development and maintenance activities. On the basis of limited site monitoring, the trend of site conditions in the RFO is considered to be downward. Indications of active vandalism or collecting (unauthorized digging and "pothunting") have been observed in limited instances. Archaeological and historic sites are known to be deteriorating from a variety of causes. Many sites are deteriorating from natural causes and many others from the illegal activities of artifact collectors. Inadvertent damage from construction projects also affects resources. Collectively, these agents have adversely affected and continue to adversely affect many known cultural resources.

3.3.5.6 Consultation

Section 106 of the National Historic Preservation Act of 1966 requires the BLM and other federal agencies to take into account the effects of their undertakings on historic properties, and afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment. The historic preservation review process mandated by Section 106 is outlined in regulations issued by ACHP. The BLM first determines whether it has an undertaking that is defined in the regulations as a type of activity that could affect historic properties. Historic properties are properties that are included in the NRHP or that meet the criteria for the NRHP. If so, BLM must consult with the State Historic Preservation Officer (SHPO). If BLM determines that it has no undertaking, or that its undertaking is a type of activity that has no potential to affect historic properties, the agency has no further Section 106 obligations.

In most of Utah, the BLM operates under the State Protocol Agreement with the Utah SHPO that defines the manner in which the BLM will meet its responsibilities under the NHPA as well as the National Programmatic Agreement among the BLM, the ACHP, and the National Conference of State Historic Preservation Officers. The agreement established certain review thresholds under which the BLM will request the review of the Utah SHPO and the ACHP in certain situations. These include:

- Non-routine interstate and/or interagency projects or programs
- Undertakings that directly and adversely affect National Historic Landmarks or National Register eligible properties of national significance
- Highly controversial undertakings, when council review is requested by the BLM, SHPO, a Native America tribe, a local government, or an applicant for a BLM authorization
- Undertakings affecting National Register eligible or listed properties
- Land exchanges, land sales, Recreation and Public Purposes Act (R&PP) leases, and transfers
- When BLM professional staff lack the appropriate regional experience or professional expertise, and until performance is mutually acceptable to the BLM Deputy Preservation Officer and SHPO
- When BLM's professional cultural resources staff wishes to bring a particular project to the attention of the SHPO.

The Protocol Agreement allows the BLM to streamline the review process significantly on projects that do not affect historic properties. The following steps would be followed in determining that there would be "no potential to affect": (1) identify the area of potential effect (APE); (2) conduct a Class I (literature) search and/or review other relevant records for historic properties/eligible historic properties within the APE; (3) notify the tribes or other entities that would have consulting party status of the proposed action and provide them with the opportunity to identify traditional cultural and religious properties and/or other historic and potentially eligible properties; (4) communicate/consult with tribes and other entities that would have consulting party status through letter and phone calls which, if properly documented, should demonstrate a "good faith" effort on the BLM's part; and (5) carefully and thoroughly document the BLM's findings and communications/consultation. The BLM will not request the review of the SHPO in the following situations:

- No Potential to Affect determinations by qualified BLM staff
- No Historic Properties Affected; no sites present, determined by qualified BLM staff
- No Historic Properties Affected; no eligible sites present, determined by qualified BLM staff
- No Historic Properties Affected; eligible sites present, but not affected as defined by 36 CFR 800.4.

During the life of this plan a number of actions—such as vegetation treatments, land disposals, range improvements, or energy development—may occur. Before any of the activities are implemented, the field office will take into account the effects these actions will have on cultural resources. This process is accomplished through the regulations of National Historic Preservation Act contained in Title 36 of the Code of Federal Regulations, Part 800, and agreements between BLM and the Utah State Historic Preservation Officer. Native American tribes having an interest in the area are also consulted prior to any federal undertaking.

3.3.5.7 Native American Religious Concerns

The area encompassed by the planning area boundary has seen considerable prehistoric and historic Native American use. Several federally recognized Native American tribes identified to date have either a history of traditional use in or ancestral ties to this area (although there may be other tribes interested in the area). These tribes are:

- Paiute Indian Tribe of Utah (headquartered in Cedar City, Utah)
- Uintah and Ouray Ute (headquartered in Ft. Duchesne, Utah)
- Hopi Tribe (headquartered in Kykotsmovi, Arizona)
- Navajo Nation (headquartered in Window Rock, Arizona)
- Southern Ute Tribe (headquartered in Ignacio, Colorado)
- Ute Mountain Ute Tribe (headquartered in Towaoc, Colorado)
- Kaibab Paiute Tribe (headquartered in Pipe Springs, Arizona)
- San Juan Southern Paiute Tribe (headquartered in Tuba City, Arizona)
- Moapa Paiute Band (headquartered in Moapa, Nevada)
- White Mesa Ute Band (headquartered in White Mesa, Utah).

In addition to these tribes, the BLM also includes the Navajo Utah Commission in Montezuma Creek, Utah, and the Utah Division of Indian Affairs in Salt Lake City, Utah, in discussions related to BLM actions (including land use planning).

The BLM is the present custodian of the public land in the planning area, but this was not always the case. Innumerable Native American groups were present in this area for thousands of years prior to Euro-American contact and occupation that began a few hundred years ago. Spiritual, emotional, and physical

ties between these Native Americans and their traditional homelands have existed for a long time and will no doubt continue to exist.

Native Americans practice their religions in many places on federal lands. Many of the lawful activities that are permitted or authorized on federal lands can compromise the integrity of sacred places and the privacy of religious practices. With this in mind, Executive Order (EO) 13007 on Indian Sacred Sites was signed "to protect and preserve Indian religious practices." The order obligates federal land managers to work with Native American tribes to help protect their basic rights and the practice of their religions. When planning and implementing land uses, BLM generally has the ability to accommodate tribal access to sacred sites and to prevent physical damage or intrusions that might impede their use—if the existence of the sites is known.

3.3.5.8 Tribal Interest

The Paiutes claim both traditional use of and ancestral ties to the area managed by the RFO. Their interest includes specific claims relating to important and sacred areas as well as to certain other site locations. Some of these claims have recently been documented and supported in an ethnographic study conducted by Dr. Richard Stoffle of the University of Arizona (September 2004).

The Hopi claim ancestral ties to the prehistoric groups represented here and believe that they can trace Hopi clan migrations through symbols present in area rock art. The Utes have ancestral ties to central Utah. Both the Uintah and Ouray Ute and the Hopi Tribe have been willing to enter into consultation with BLM and comment on proposals in the RFO that have the potential to affect tribal interests.

The Navajo interest in this area is confined to that part of the planning area east of Capitol Reef National Park and stems from the 1850s, when Kit Carson and the U.S. Army attempted to round up the Navajos and move them from their ancestral homeland into New Mexico. During this "Long Walk" or "Big Roundup" time, many Navajo people escaped north into the Henry Mountains and remained there for some time. As a result, the Navajo Nation claims this area as a traditional cultural property, although no formal nomination as such has been made to date. The Navajo interest also extends to the Dirty Devil River corridor and the Horseshoe Canyon drainage.

Meetings to discuss the RMP have been held with all the tribes mentioned above. A more detailed discussion of consultation with Native American tribes can be found in Chapter 5 of this Proposed RMP/Final EIS.

3.3.6 Paleontological Resources

Paleontological resources are integrally associated with the rock formations in which they are located. The geographic extent of the lands managed by the RFO contains approximately 40 sedimentary geologic formations at the surface, most containing paleontological resources.

Sedimentary formations are formed through depositional processes that lead to characteristic traits and varying potential for certain types of fossils. If extensive excavation of a certain formation in one geographic area results in substantial fossil resources, a potential exists that similar fossils will be found elsewhere in the formation, although such consistency is not a guarantee. A comprehensive paleontological resource inventory has not been completed within the RFO; however, a review of paleontological research on formations contained within the RFO has identified the types of fossil resources known to be present. Table 3-13 identifies the geologic formations within the RFO, their predominant depositional environments, and the types of fossils present. The geologic map of the planning area (Map 6 of the *Mineral Potential Report* [BLM 2005b]) displays these formations in relation to the planning area boundaries.

Table 3-13. Geologic Formations Present in the Planning Area

Formation Age	Formation Name	West[1]	East[1]	Depositional Environment	Fossils Present
Quaternary	Surficial Alluvium and Colluvium	X	X	Several	Vertebrate
	Surficial Older Alluvium and Colluvium	X	X	Several	Vertebrate
Tertiary	Sevier River Formation	X		Fluvial, Lacustrine	Vertebrate; Invertebrate
	Volcanic Rocks, Undivided	X		Volcanic with some Fluvial	Invertebrate
	Dipping Vat Formation (not noted on map)	X		Fluvial	Plant
	Grey Gulch Formation (also Bald Knoll and Aurora)	X		Lacustrine	Invertebrate; Plant
	Claron Formation (not noted on map)	X		Fluvial/Lacustrine	Invertebrate; Plant
	Green River Formation	X		Freshwater Lacustrine and Fluvial	Vertebrate; Invertebrate; Plant
	Colton Formation (not noted on map)	X		Primarily Alluvial with Marginal Lacustrine and Deltaic Facies	Vertebrate; Invertebrate
	Flagstaff Formation	X		Lacustrine/Marine	Vertebrate; Invertebrate; Plant; Trace
Cretaceous-Tertiary	North Horn Formation	X		Lacustrine/Fluvial	Vertebrate; Invertebrate; Plant; Trace

Formation Age	Formation Name	West[1]	East[1]	Depositional Environment	Fossils Present
Cretaceous	Price River Formation (Mesa Verde Group)	X		Fluvial and Floodplain	Plant
	Blackhawk Formation (Mesa Verde Group)	X		Deltaic and Interdeltaic	Trace vertebrate; Plant
	Star Point Sandstone (Mesa Verde Group)	X		Beach Sand and Intermediate Marine Shale	Plant; Trace
	Indianola Group (Sixmile Canyon Fm; Funk Valley Fm; Allen Valley Shale; Sanpete Fm)	X		Fluvial	Invertebrate
	Straight Cliffs Formation	X		Coastal Plain Interfingering with Marine	Vertebrate; Trace vertebrate; Invertebrate; Plant
	Mancos Shale (including Tununk and Wahweap Members)	X	X	Marine	Vertebrate; Trace vertebrate; Invertebrate; Trace invertebrate; Plant
	Dakota Sandstone	X	X	Beach to Marginal Marine (Deltaic)	Vertebrate; Invertebrate; Plant; Trace
	Cedar Mountain Formation		X	Fluvial	Vertebrate; Trace vertebrate; Plant
Jurassic	Morrison Formation (Brushy Basin and Salt Wash Members)	X	X	Fluvial	Vertebrate; Trace vertebrate; Invertebrate; Plant
	Summerville Formation		X	Tidal Flat	Trace vertebrate
	Curtis Formation (not noted on map)		X	Marine	Invertebrate
	Twist Gulch Formation (not noted on map)	X		Marginal Fluvial, Nearshore	Invertebrate
	Entrada Sandstone		X	Nearshore Eolian	Trace vertebrate; Plant
	Carmel Formation		X	Shallow Marine	Trace vertebrate; Invertebrate, Plant
	Arapien Shale	X		Supratidal, Marginal Nearshore Fluvial	Invertebrate; Plant
Triassic-Jurassic	Navajo Sandstone	X	X	Eolian	Trace vertebrate; Plant
Triassic	Kayenta Formation	X	X	Fluvial	Trace vertebrate; Plant
	Wingate SS (not noted on map)	X	X	Eolian	Trace vertebrate
	Chinle Formation	X	X	Fluvial	Vertebrate; Trace vertebrate; Invertebrate; Plant (wood)

Formation Age	Formation Name	West[1]	East[1]	Depositional Environment	Fossils Present
	Moenkopi Formation	X	X	Marine/Tidal Flat	Vertebrate; Trace vertebrate; Invertebrate; Trace invertebrate; Plant
Permian	Kaibab Limestone/Toroweap Formation	X	X	Marine	Invertebrate
	Cutler Group		X	Eolian, Fluvial, and Shallow Marine	Vertebrate; Invertebrate; Plant; Trace vertebrate; Trace Plant
Pennsylvanian	Hermosa Group		X	Marine	Invertebrate

Note
1—East and West refers to the eastern and western portions of the planning area, with Capitol Reef National Park forming the dividing line between the two sides.
Sources: Condon 1997; Doelling 2004; Graffam and Bourdon 1999; M. Hayden, Utah Geological Survey, Personal communication, 2004; Hintze *et al*. 2003; Rowley *et al*. 2002; Rowley, *et. al*. 2004; Steven *et al*. 1990; Stokes 1986.

More than half of the sedimentary formations (23 of 40) in the planning area are known to contain vertebrate or trace vertebrate fossils. However, some formations have a higher potential than others to contain significant numbers of vertebrate fossils. The Morrison and Cedar Mountain formations are noted for vertebrate fossils. Several complete fossil skeletons have been scientifically excavated from several specific localities in the planning area.

In addition to the potential for containing paleontological resources, paleontological localities identify areas where the presence of fossils is known. Roughly 587 paleontological localities are in the 5 counties composing the planning area. The BLM is responsible for managing about one-third of these localities.

3.3.7 Visual Resources

The planning area contains a broad range of visual settings, ranging from mountain landscapes and steep canyons, to agricultural settings, to desert. The purpose of visual resource management (VRM) is to manage the quality of the visual environment and reduce the visual impact of development activities while maintaining the viability of all resource programs. VRM involves applying methods for evaluating landscapes and determining appropriate techniques and strategies for maintaining visual quality and reducing adverse impacts.

3.3.7.1 Visual Resource Inventory

Before the current land use plans (LUP) were completed, visual resource inventories were conducted for most of the area now encompassed by the RFO. In those inventories, each acre of land was evaluated and assigned a scenic quality rating: A, B or C, with "A" representing the most scenic lands and "C" the least scenic. Criteria for determining the ratings are included in BLM Manual H-8410-1, *Visual Resource Inventory*. The BLM relied on these existing scenic quality evaluations for the purposes of this RMP revision. The earlier inventories excluded a small portion of public land in Garfield County between the Dixie National Forest and the Wayne County border. In July 2003, the BLM inventoried this area for this RMP revision.

3.3.7.2 Visual Resource Management

The BLM's VRM methodology begins with the inventory process. Landscapes are evaluated based on scenic quality, visual sensitivity, and distance zones (the distance from the existing network of travel routes). VRM class recommendations are based on the inventory process, and final class determinations are established by the RMP. The VRM Class objectives are:

- **Class I—**Preserve the existing character of the landscape. Management activity should be very limited. Change to scenery: very low and must not attract attention.
- **Class II—**Retain the existing character of the landscape. Management activities may be seen. Change to scenery should be low and not attract the attention of the casual observer.
- **Class III—**Partially retain the existing character of the landscape. Management activities may be seen and may attract the attention of the casual observer but should not dominate the view.
- **Class IV**—Allow major modifications of the existing character of the landscape. Management activities may dominate the view and be the major focus of viewer attention.

Current VRM classes for the RFO are shown below in Table 3-14 and on Map 2-1.

Table 3-14. Visual Resource Management Classes

VRM Class	Acres (BLM-Administered Surface)
Class I	0
Class II	529,500
Class III	569,000
Class IV	1,029,500

Source: BLM LUPs

It should be noted that although current LUPs for the RFO did not inventory or classify any lands as VRM Class I, the BLM's visual resource management direction for lands within wilderness study areas is guided by BLM Instruction Memorandum (IM) 2000-96. This memorandum requires that all Wilderness Study Areas (WSA) be managed according to VRM Class I management objectives until such time as the Congress decides to designate the area as wilderness or release it for other uses. The RFO contains 11 WSAs (446,900 acres) that are managed as VRM Class I.

The RFO encompasses many areas with a high degree of scenic quality and a high level of visual sensitivity. In general, high scenic quality within the RFO occurs where the area has varied topography, unique geology, and striking vistas. Areas with high visual sensitivity are the result of a high degree of visitor interest in and public concern for a particular area's visual resources, an area's high degree of public visibility, the level of use of an area by the public, and the type of visitor use that an area receives. These visual resources are appreciated by the local population and by the visiting public.

The area's scenic qualities attract visitors. The main locations in the RFO with outstanding scenic quality and/or high visual sensitivity include, but are not limited to:

- Class A scenery (VRM Class II)
- Eleven WSAs (VRM Class I)
- Scenery in the foreground, middle distance, and background zones of major paved recreation highways (U-12, U-24, U-95, U-276)
- Scenery in the foreground and middle distance zones of unpaved roads designated as Scenic Byways (Fishlake Scenic Byway and Bull Creek Pass Backcountry Byway)
- Scenery in the foreground and middle distance zones of unpaved roads designated as Utah Scenic Byways (Kimberly/Big John Road, Cove Mountain Road, Cathedral Valley Road; Thousand Lake Mountains Road, Gooseberry/Fremont Road, Notom Road, and Posey Lake Road)
- Areas along the public land/urban interface such as the Red Gates in Wayne County and the low hills surrounding the communities of Glenwood and Annabella in Sevier County.

3.3.8 Special Status Species

Special status species (SSS) are plants, fish, and animals that require particular management attention as a result of population or habitat concerns. There are 5 categories—

- Federally Listed Threatened and Endangered (T&E) Species and Designated Critical Habitats
- Federally Proposed Species and Proposed Critical Habitats
- Federal Candidate Species
- BLM Sensitive Species
- State Listed Species.

Federally listed species can have habitat designated as critical to species viability. Only the Mexican spotted owl has designated critical habitat within the planning area (Map 3-4). In the case of species that are listed and do not have critical habitat designated, BLM cooperates with the U.S. Fish and Wildlife Service (USFWS) to determine and manage habitats of importance. BLM is working with local working groups in developing management plans for several SSS.

USFWS has responsibility under a number of federal laws, treaties, EOs, and memoranda of agreement (MOA) for the conservation and management of many fish, wildlife, and plant species, and habitat. USFWS provides recommendations for protective measures for T&E species in accordance with the Endangered Species Act (ESA), as amended. Protective measures for migratory birds are provided in accordance with the Migratory Bird Treaty Act of 1918 (MBTA) and Bald Eagle Protection Act of 1940. Wetlands are afforded protection under EOs 11990 (wetland protection) and 11988 (floodplain management) and Section 404 of the CWA. Other fish and wildlife resources are considered under the Fish and Wildlife Coordination Act.

BLM has entered into an MOA with USFWS and the USFS to improve the efficiency and effectiveness of plan-level Section 7 consultation processes under the ESA. Through this MOA, BLM agrees to promote the conservation of candidate, proposed, and listed species and to informally and formally consult on listed and proposed species and designated and proposed critical habitat during planning to protect and improve the condition of species and their habitats to a point where their special status recognition is no longer necessary.

3.3.8.1 Species Listed Under the Endangered Species Act

Table 3-15 identifies the federally listed species in the planning area. The Draft Resource Management Plan/Draft Environmental Impact Statement (DRMP/DEIS) included Jones cycladenia (*Cycladenia jonesii*) as a threatened species. However, further review and surveys did not find the species within the RFO; therefore, it is not included in Table 3-15.

Table 3-15. Federally Listed Species

Common Name	Scientific Name	Status
Birds		
California Condor	*Gymnogyps californianus*	Experimental
Mexican Spotted Owl	*Strix occidentalis*	Threatened
Southwestern Willow Flycatcher	*Empidonax traillii extimus*	Endangered
Western Yellow-billed Cuckoo	*Coccyzus americanus*	Candidate

Common Name	Scientific Name	Status
Mammals		
Utah Prairie Dog	*Cynomys parvidens*	Threatened
Fish		
Bonytail Chub	*Gila elegans*	Endangered
Colorado Pikeminnow	*Ptychocheilus lucius*	Endangered
Humpback Chub	*Gila cypha*	Endangered
Razorback Sucker	*Xyrauchen texanus*	Endangered
Plants		
Wright Fishhook Cactus	*Sclerocactus wrightiae*	Endangered
Barneby Reed-Mustard	*Schoencrambe barnebyi*	Endangered
San Rafael Cactus	*Pediocactus despainii*	Endangered
Winkler Cactus	*Pediocactus winkleri*	Threatened
Last Chance Townsendia	*Townsendia aprica*	Threatened
Ute Ladies'-tresses	*Spiranthes diluvialis*	Threatened
Maguire Daisy	*Erigeron maguirei*	Threatened

Source: USFWS 2004.

California Condor

The California condor was listed as endangered on March 11, 1967, and noted to occur only in California. USFWS has reintroduced California condors into northern Arizona and southern Utah, and designated these birds as nonessential experimental populations under the ESA. The purpose of the reintroduction was to achieve a primary recovery goal: the establishment of a second noncaptive population, spatially disjunct from the noncaptive population in southern California.

California condors are among the largest flying birds in the world, with adults weighing up to 22 pounds. Condors are opportunistic scavengers, feeding only on carcasses. Since European settlement of California, condor populations have steadily declined. Poisoning, shooting, egg and specimen collecting, collisions with artificial structures, and loss of habitat contributed to the decline of the species. By 1987, the last wild condor was captured and taken to the San Diego Wild Animal Park. Beginning with the first successful breeding of California condors in 1988, the population (in 1996) was 121 individuals, including 104 in the captive flock and 17 in the wild. The condor experimental reintroduction imposes two requirements on federal agencies: (1) that they use their authority to conserve the condors, and (2) that they informally confer with USFWS on actions likely to jeopardize the condor (50 CFR Part 17).

Birds from northern Arizona frequently forage and roost in Utah and are likely to nest in southern Utah (Utah Division of Wildlife Resources [UDWR] 2005c). To date there are no known California condor nesting or roosting sites in the RFO. Threats to the condors include inadequate protection of suitable nesting sites and foraging areas near nesting sites (UDWR 2005c).

The planning area includes habitat that contains both the experimental population (Areas South of I-70) and habitat that could be occupied by California condors in non-experimental areas (North of I-70). Therefore, one analysis in the Biological Assessment (BA) includes the endangered California condor that may migrate north of I-70 and another analysis is made to determine effects on the experimental population south of I-70.

Mexican Spotted Owl

The Mexican spotted owl was listed as a threatened species on March 16, 1993. The range of the Mexican spotted owl extends from the southern Rocky Mountains in Colorado and the Colorado Plateau in central and southern Utah, southward through Arizona and New Mexico. Mexican spotted owls primarily forage at night. Their diet consists of a variety of mammals, birds, reptiles, and insects, with mammals constituting the bulk of the diet throughout the owl's range. Wood rats, voles, and gophers are the primary mammal food base. Steep slopes and canyons with rocky cliffs characterize much of the owl's habitat in the planning area.

A recovery plan was completed for the Mexican spotted owl in 1995. Mexican spotted owls in the RFO are located within the Colorado Plateau Recovery Unit. Threats to Mexican spotted owls include habitat loss associated with human disturbance and past and current timber harvest activity.

Designated critical habitat was established for the Mexican spotted owl in 2001 and revised in 2004. This designated habitat contains important nesting and foraging habitat for the owl. The critical habitat designation clarified that areas within critical habitat boundaries are considered critical habitat only when they contain or have the potential to contain habitat characteristics essential to the conservation of the species. For canyon habitats, the primary constituent elements include one or more of the following attributes: (1) cooler and often more humid conditions than the surrounding area; (2) clumps or stringers of trees and/or canyon walls with crevices, ledges, or caves; (3) a high percentage of ground litter and woody debris; and (4) riparian or woody vegetation. The primary constituent elements related to forest structure include the following: (1) a range of tree species; (2) a shade canopy created by the tree branches, covering 40 percent or more of the ground; and (3) large, dead trees with a trunk diameter of at least 12 inches (measured at 4.5 feet above ground surface).

Southwestern Willow Flycatcher

The southwestern willow flycatcher was listed as an endangered species on February 27, 1995. It breeds primarily in the southwestern United States and winters in Central America and southern Mexico. The southwestern willow flycatcher is found in the southern and eastern parts of the State of Utah, along riparian zones of the Colorado Plateau. Current population status and trends for the southwestern willow flycatcher are unknown in Utah. Critical habitat for the southwestern willow flycatcher has been designated along the Virgin River in the southwestern part of Utah near St. George. Habitat for this species exists in Wayne County (UDWR 2005a, NatureServe 2004), and there has been a sighting of the species in the Fremont Valley gateway area (Suzanne Grayson, BLM RFO, Personal communication 2004). The southwestern willow flycatcher is rare in southern Utah during the summer and is found most frequently in riparian habitats, especially in areas of dense willows associated with rivers and wetlands. The major factor in the decline of the flycatcher is the alteration/loss of the riparian habitat necessary for the species (UDWR 2005a).

Western Yellow-billed Cuckoo

This species is considered a riparian obligate and is usually found in large tracts of dense cottonwood/willow habitats (below 33 feet in height). Population status and trends within the planning area are unknown; however, a pair of yellow-billed cuckoos was heard during breeding season before 1983. More recent breeding has been recorded outside the planning area. Yellow-billed cuckoo nesting behavior may be closely tied to food abundance. The species is one of the latest migrants to arrive and breed in Utah. The yellow-billed cuckoos arrive in late May or early June and breed in late June through July. Nesting habitat is classified as dense lowland riparian characterized by a dense subcanopy or shrub layer (regenerating canopy trees, willows, or other riparian shrubs) within 333 feet of water. Threats to the species include the alteration of riparian corridors from invasive species, livestock use, and development (UDWR 2005a, NatureServe 2004).

Utah Prairie Dog

The Utah prairie dog was listed as an endangered species on June 4, 1973. On May 29, 1984, the prairie dog was downlisted to threatened. Historically, the Utah prairie dog was found in southwestern and central Utah. The habitat of a prairie dog consists of continuous grassland and other vegetation on flat plains. The prairie dog is found at elevations from 5,400 feet in Iron County to 9,500 feet in Wayne County, and lives both above ground and underground. The most obvious feature of a prairie dog colony is the abundance of mounds and holes. Utah prairie dog habitat is commonly divided into 3 recovery areas: the West Desert, the Paunsaugunt Plateau, and the Awapa Plateau. Portions of the Awapa Plateau and Paunsaugunt recovery areas are in the RFO.

Major threats to the Utah prairie dog include habitat loss (through development and drought), poisoning, and the plague. Prairie dogs are susceptible to several diseases. These factors lead to rapid decline and even disappearance of entire colonies.

A recovery plan was completed for the Utah prairie dog in 1991. A Utah Prairie Dog Interim Conservation Strategy was completed in 1997 (IM-UT 2002-040). A current management practice for the prairie dog is a translocation program. Translocation of prairie dogs is authorized by USFWS under authority of the ESA, as amended. It is anticipated that translocations will be a major part of the management of the Utah prairie dog in the future. No critical habitat has been designated for the Utah prairie dog.

Colorado River Fish

There are 4 species of fish endemic to the Colorado River Basin listed as endangered under the ESA. None of these species or their designated critical habitat occurs within the public lands administered by the RFO. Some historic habitat was found on the Dirty Devil River; however, due to fluctuations in flows, this river is not current habitat. However, because these species and their designated critical habitat are located downstream from the RFO and because some streams that traverse the RFO are tributaries to the Colorado River Basin, they are briefly discussed here.

Bonytail Chub

The bonytail chub was listed by USFWS as an endangered species in 1980. The bonytail is found in larger channels of the Colorado River system. They are endemic to the large rivers (Colorado, Green, and San Juan) of the Colorado River Basin. In April 1994, USFWS designated 1,980 miles of critical habitat for all 4 Colorado River fish in portions of Colorado, Utah, New Mexico, Arizona, Nevada, and California (50 CFR Part 17). UDWR has documented populations of bonytail chub within eastern Emery, Wayne, and Garfield counties (UDWR 2005a). Bonytail prefer eddies, pools, and backwaters near swift current in large rivers. Because the historic and occupied range of the bonytail is restricted to the mainstem of the Green River, it does not substantially extend into any tributaries, such as the Dirty Devil River, originating from the planning area (USFWS 1990a).

The historical distribution of bonytail is poorly documented, but on the basis of former collections, the optimum habitat of bonytail chubs appears to be the open river areas of relatively uniform depth and current velocity. Adults are found mainly in pools and eddies with silt, sand, or boulder substrates. Young occur in still water or shallow pools with silt or gravel (Bosworth 2003).

Threats of extinction stem from habitat loss (including alterations to natural flows and changes to temperature and sediment regimes), proliferation of non-native introduced fish, and other artificial disturbances (USFWS 1994b). Goals for management and conservation of bonytail are described in *Bonytail* (*Gila elegans*) *Recovery Goals*: *Amendment and Supplement to the Bonytail Chub Recovery*

Plan (USFWS 2002a), and incorporated in Appendix 14 of this Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS).

Colorado Pikeminnow

The Colorado pikeminnow (formerly known as the Colorado squawfish) is a large minnow native to the Colorado River system of the western United States and Mexico. USFWS designated this species as endangered in 1967, and the species is also included in the UDWR Sensitive Species List (2003). The species is distributed within Wayne and Garfield counties in large mainstem rivers (Green River and Colorado River) and in the lower reaches of major tributaries. In the Green River drainage, the mainstem is occupied from the confluence with the Colorado River upstream through Dinosaur National Monument. Because the historic and occupied range of the pikeminnow is restricted to the mainstem of the Green River, it does not substantially extend into any tributaries, such as the Dirty Devil River, originating from the planning area (USFWS 1991).

Changes in sediment deposition patterns, flow, and temperature caused by dams have resulted in loss and alteration of aquatic habitats and have favored non-native competitors and predators (Bosworth 2003). Threats of extinction stem from habitat loss (including alterations to natural flows and changes to temperature and sediment regimes), proliferation of non-native introduced fish, and other artificial disturbances (USFWS 1994b). Recovery goals have been formulated to guide management and conservation efforts and are described in *Colorado Pikeminnow* (*Ptychocheilus lucius*) *Recovery Goals: Amendment and Supplement to the Colorado Squawfish Recovery Plan* (USFWS 2002b), and are incorporated as conservation measures in Appendix 14 of this PRMP/FEIS.

Humpback Chub

The humpback chub is a rare minnow native to the upper Colorado River system. Because of the severe declines in humpback chub numbers and distribution, the species was listed as endangered in 1967 and is also included in the UDWR Sensitive Species List (2003). USFWS designated critical habitat in April 1994, as described under *bonytail chub*, above.

Humpback chub originally thrived in the fast, deep whitewater areas of the Colorado River and its major tributaries; but flow alterations, which have changed the turbidity, volume, current speed, and temperature of the water in those rivers, have had significantly adverse impacts on the species. Humpback chub in Utah are now confined to a few whitewater areas in the Colorado, Green, and White rivers (Bosworth 2003). Because the historic and occupied range of the humpback chub is restricted to the mainstem of the Green River, it does not substantially extend into any tributaries, such as the Dirty Devil River, originating from the planning area (USFWS 1990b).

Threats of extinction stem from habitat loss (including alterations to natural flows and changes to temperature and sediment regimes), proliferation of non-native introduced fish, and other artificial disturbances (USFWS 1994b). Recovery goals to guide management and conservation of the species are documented in *Humpback Chub Recovery Goals: Amendment and Supplement to the Humpback Chub Recovery Plan* (USFWS 2002c), and incorporated as conservation measures in Appendix 14.

Razorback Sucker

The razorback sucker was listed as endangered in 1991 and is also included in the UDWR Sensitive Species List (UDWR 2003). The species is believed to have historically occupied much of the Green, Colorado, and San Juan rivers, as well as the lower portions of large tributaries such as the White and Duchesne rivers. Razorback sucker occur in water of desert and submontane elevations. Habitat may vary seasonally and includes pools, slow runs, backwaters, and flooded off-channel areas (Bosworth 2003). Current distribution patterns are difficult to interpret, primarily because the species is rarely encountered.

USFWS designated critical habitat in April 1994, as described under *bonytail chub*. A subpopulation of approximately 100 adults was found in the 1990s occupying the middle Green River, and UDWR has noted population distribution within Wayne County (Bosworth 2003, UDWR 2005a). Because the historic and occupied range of the razorback sucker is restricted to the mainstem of the Green River, it does not substantially extend into any tributaries, such as the Dirty Devil River, originating from the planning area (USFWS 1998).

The razorback sucker eats mainly algae, zooplankton, and other aquatic invertebrates. Successful reproduction has not been documented in the last 25 years. Spawning occurs during a 6-week period in April and May when water temperatures reach 53°F–64°F.

Threats of extinction stem from habitat loss (including alterations to natural flows and changes to temperature and sediment regimes), proliferation of non-native introduced fish, and other artificial disturbances (USFWS 1994b). The USFWS has developed recovery goals to guide management and conservation efforts (USFWS 2002d).

Wright Fishhook Cactus

Wright fishhook cactus is a federally listed endangered plant that occurs in Emery, Sevier, and Wayne counties. The species is found in soils that range from clays to sandy silts to fine sands, typically in areas with well-developed biological soil crusts (Clark and Clark 1999). Wright fishhook cactus grows in salt desert shrub and widely scattered pinyon-juniper woodlands at elevations ranging from 4,280 to 6,440 feet (Utah Native Plant Society 2004). The species and its habitat are vulnerable to disturbance from domestic livestock grazing, mineral resource development, and OHV use (USFWS 1979).

Barneby Reed-Mustard

Barneby reed-mustard is a federally listed endangered plant found only in Emery and Wayne counties. The species grows on red clay soils rich in selenium and gypsum, overlain with sandstone talus derived from the Moenkopi and Chinle geologic formations (USFWS 1994a). Barneby reed-mustard grows in sparsely vegetated sites in mixed desert shrub and pinyon-juniper woodlands, at elevations ranging from 4,788 to 6,510 feet (Clark and Clark 1999). Potential threats to the population of Barneby reed-mustard include mining, trampling by hikers, and road or recreation development (USFWS 1994a).

San Rafael Cactus

San Rafael cactus is a federally listed endangered plant that grows in Emery and Wayne counties. It is found in fine-textured soils rich in calcium derived from the Carmel Formation and the Sinbad Member of the Moenkopi Formation. The species grows on benches, hilltops, and gentle slopes in pinyon-juniper woodlands and mixed desert shrub-grassland communities, at elevations ranging from 4,756 to 6,822 feet (Utah Native Plant Society 2004; USFWS 1995c). The habitat of San Rafael cactus is vulnerable to surface disturbance from OHV use, trampling by humans and livestock, and mineral resource exploration and development (Clark and Clark 1999).

Winkler Cactus

Winkler cactus is a federally listed threatened plant that occurs in Emery and Wayne counties. The species is a small, nearly round cactus with solitary or clumped stems. The crown of the stem is at or very near ground level (Utah Rare Plant Society 2004). Winkler cactus is found in fine-textured soils derived from the Dakota Formation and the Brushy Basin Member of the Morrison Formation (Utah Native Plant Society 2004). It occurs on benches, hilltops, and gentle slopes on barren, open sites in salt desert shrub communities, at elevations ranging from 4,888 to 6,592 feet (USFWS 1995c). The habitat of the species is vulnerable to surface disturbance from OHV use, trampling by humans and livestock, and mineral resource exploration and development (Clark and Clark 1999).

Last Chance Townsendia

Last Chance townsendia is a federally listed threatened plant that occurs in Emery, Sevier, and Wayne counties. The species is found in clay, clay-silt, or gravelly clay soils derived from the Mancos Formation. These soils are often densely covered with biological soil crusts. Last Chance townsendia grows in salt desert shrub and pinyon-juniper woodlands at elevations ranging from 5,531 to 8,396 feet (USFWS 1985). Threats to Last Chance townsendia populations include poor rangeland conditions, trampling by OHV recreation use, trampling by livestock, and mining (USFWS 1993a).

Ute Ladies'-Tresses

Ute ladies'-tresses was first listed as threatened on January 17, 1992. It is currently designated as threatened across the entire range. The species is known to occur in Colorado, Idaho, Montana, Nebraska, Utah, Washington, and Wyoming (USFWS 1992). Ute ladies'-tresses is found in moist to very wet meadows, along streams, in abandoned stream meanders, and near springs, seeps, and lake shores. It grows in sandy or loamy soils that are typically mixed with gravels. In Utah, the species ranges in elevation from 4,301 to 7,001 feet. Populations have been documented in wetlands near Utah Lake in northern Utah (2 populations) and in low-elevation riparian areas in the Colorado River drainage in eastern Utah (6 populations) (USFWS 1992). The species occurs in Garfield and Wayne counties in the planning area.

A member of the orchid family, Ute ladies'-tresses is a perennial herb with a flowering stem (8–20 inches tall) that rises from a basal rosette of grass-like leaves. The flowers are ivory-colored, arranged in a spike at the top of the stem, and bloom mainly from late July through August. Recovery objectives for the species are documented in the *Ute Ladies'-Tresses Recovery Plan* (USFWS 1995b).

Threats to the species include loss of habitat from fragmentation of land due to conversion to suburban and urban areas and management of water and stream systems for municipal, agricultural, and recreation uses (USFWS 1995b).

The Ute ladies'-tresses is not currently known to occur on lands administered by the BLM RFO. The species exists within the boundary of the planning area; however, it is located only on lands administered by the Fish Lake National Forest and the Capitol Reef National Park. Surveys have been conducted on BLM land, and to date, this species has not been identified. BLM lands in the planning area provide limited habitat that could support the Ute ladies'-tresses.

Maguire Daisy

Maguire daisy is a federally listed threatened plant that occurs in Emery, Garfield, and Wayne counties. The species grows on the sand and rubble weathered from Wingate, Chinle and Navajo Sandstone, and rarely, the Kayenta Formation (Utah Native Plant Society 2004 and Clark and Clark 1999). It is found in slickrock-crevices, on ledges, and in the bottoms of washes, at elevations ranging from 5,248 to 8,200 feet (Clark and Clark 1999). In 1996, the Maguire daisy was downlisted from endangered to threatened based on the discovery of 12 additional populations. Threats to existing Maguire daisy populations are primarily from OHV use and livestock trampling (USFWS 1995d).

3.3.8.2 BLM Sensitive Species

Table 3-16 identifies those non-listed special status plant and animal species that are known or thought to occur on public lands administered by the RFO (IM-UT 2003-027). The Utah BLM Sensitive Species list changes periodically and is updated accordingly as species are added to or deleted from the list. Changes to the Utah BLM Sensitive Species list would be incorporated into the RFO RMP as they occur.

Table 3-16. Utah BLM Sensitive Species

Common Name	Scientific Name	UDWR Status
Mollusks		
California Floater	*Anodonta californiensis*	Species of Concern
Ninemile Pyrg	*Pyrgulopsis nonaria*	Species of Concern
Otter Creek Pyrg	*Pyrgulopsis fusca*	Species of Concern
Southern Bonneville Pyrg	*Pyrgulopsis transversa*	Species of Concern
Carinate Glenwood Pyrg	*Pyrgulopsis inopinata*	Species of Concern
Smooth Glenwood Pyrg	*Pyrgulopsis chamberlini*	Species of Concern
Black Canyon Pyrg	*Pyrgulopsis plicata*	Species of Concern
Amphibians		
Western (Boreal) Toad	*Bufo boreas*	Species of Concern
Great Plains Toad	*Bufo cognatus*	Species of Concern
Columbia Spotted Frog	*Rana luteiventris*	Conservation Agreement Species
Reptiles		
Common Chuckwalla	*Sauromalus ater*	Species of Concern
Desert Night Lizard	*Xantusia vigilis*	Species of Concern
Birds		
Bald Eagle	*Haliaeetus leucocephalus*	Species of Concern
American White Pelican	*Pelecanus erythrorhynchos*	Species of Concern
Ferruginous Hawk	*Buteo regalis*	Species of Concern
Greater Sage-Grouse	*Centrocercus urophasianus*	Species of Concern
Long-Billed Curlew	*Numenius americanus*	Species of Concern
Burrowing Owl	*Speotyto cunicularia*	Species of Concern
Short-Eared Owl	*Asio flammeus*	Species of Concern
Black Swift	*Cypseloides niger*	Species of Concern
Lewis's Woodpecker	*Melanerpes lewis*	Species of Concern
American Three-Toed Woodpecker	*Picoides dorsalis*	Species of Concern
Northern Goshawk	*Accipiter gentilis*	Conservation Agreement Species
Grasshopper Sparrow	*Ammodramus savannarum*	Species of Concern
Mammals		
Fringed Myotis	*Myotis thysanodes*	Species of Concern
Western Red Bat	*Lasiurus blossevillii*	Species of Concern
Spotted Bat	*Euderma maculatum*	Species of Concern
Townsend's Big-Eared Bat	*Corynorhinus townsendii*	Species of Concern
Allen's Big-Eared Bat	*Idionycteris phyllotis*	Species of Concern
Big Free-Tailed Bat	*Nyctinomops macrotis*	Species of Concern
Pygmy Rabbit	*Brachylagus idahoensis*	Species of Concern
Kit Fox	*Vulpes macrotis*	Species of Concern
Fish		
Bonneville Cutthroat Trout	*Oncorhynchus clarkii utah*	Conservation Agreement Species
Colorado River Cutthroat Trout	*Oncorhynchus clarkii pleuriticus*	Conservation Agreement Species
Southern Leatherside Chub	*Lepidomeda aliciae*	Species of Concern
Roundtail Chub	*Gila robusta*	Conservation Agreement Species

Common Name	Scientific Name	UDWR Status
Bluehead Sucker	*Catostomus discobolus*	Conservation Agreement Species
Flannelmouth Sucker	*Catostomus latipinnis*	Conservation Agreement Species
Plants		
Rabbit Valley Gilia, also known as Wonderland Alice-flower	*Gilia cespitosa also known as Aliciella cespitosa*	Conservation Agreement Species[1]
Utah Phacelia	*Phacelia utahensis*	
Basalt Milkvetch	*Astragalus subcinereus var. basalticus*	
Pinnate Spring Parsley	*Cymopterus beckii*	Conservation Agreement Species[1]
Creutzfeldt cryptanth	*Cryptantha creutzfeldtii*	
Hole-in-the-Rock Prairie-Clover	*Dalea flavescens var. epica*	
Cronquist Wild Buckwheat	*Eriogonum corymbosum var. cronquistii*	
Smith Wild Buckwheat	*Eriogonum corymbosum var. smithii*	
Utah Spurge	*Euphorbia nephradenia*	
Cataract Gilia	*Gilia latifolia var imperialis*	
Mussentuchit Gilia	*Gilia tenuis* *Also known as Aliciella tenuis*	Conservation Agreement Species[1]
Alcove Bog-Orchid	*Habenaria zothecina*	
Greenwood's Goldenbush	*Haplopappus lignumviridis*	
Claron Pepperplant	*Lepidium montanum var. claronense*	
Entrada Rushpink	*Lygodesmia grandiflora var. entrada*	
Jones' Indigo Bush	*Psorothamnus polydenius var. jonesii*	
Arapien Blazingstar	*Mentzelia argillosa*	
Jane's Globemallow	*Sphaeralcea janeae*	
Psoralea Globemallow	*Sphaeralcea psoraloides*	
Alpine Greenthread	*Thelesperma subnudum var. alpinum also known as Thelesperma windhamii*	
Sigurd Townsendia	*Townsendia jonesii var. lutea*	

Note:

[1]Central Utah Navajo Sandstone Endemics Conservation Agreement for *Aliciella caespitosa* (Rabbit Valley gilia or Wonderland alice-flower), *Aliciella tenuis* (Mussentuchit gilia), *Astragalus harrisonii* (Harrison's milkvetch), *Cymopterus beckii* (Pinnate spring-parsley), *Erigeron maguirei* (Maguire's Daisy). 2006. Forest Service, Fishlake National Forest; Bureau of Land Management, Utah State Office; National Park Service, Capitol Reef National Park; Fish and Wildlife Service, Utah Field Office.

Unless otherwise noted, the information presented below for non-listed special status plant and animal species comes from the UDWR website (www.wildlife.utah.gov). Additional information on these species can be obtained at this site.

Mollusks

California floater *(Anodonta californiensis)*

The California floater has been found in Piute and Otter Creek reservoirs within the RFO planning area. At least 2 other extant occurrences are known in Utah and Millard counties. Known habitat ranges from muddy bottoms with depths of 6 to 10 inches among watercress to creeks 5 to 15 feet wide, up to 18

inches deep, with a bottom of gravel and sand in flowing areas and mud in pools. It is thought that populations of this species may be declining due to pesticides in agricultural run-off, habitat degradation by cattle, and water diversion.

Ninemile Pyrg *(Pyrgulopsis nonaria)*

The Ninemile pyrg is known to inhabit 2 springs near Ninemile Reservoir in Sanpete County. It is not known to inhabit public land administered by the RFO; however, springs on BLM land may provide habitat for the species. The species is "abundant" in 1 of the 2 springs it inhabits, but actual population size and trends are unknown. The limited occurrence of this species and the vulnerability of its habitat suggest that potential threats to the species are great. Inventories for this species within potential habitat on RFO-administered land would be beneficial.

Otter Creek Pyrg *(Pyrgulopsis fusca)*

The Otter Creek pyrg is associated with habitats produced by the outflow of springs. Only 3 known populations of this species exist; 1 population is in Piute County and 2 are in Sevier County. None of these populations is on public land administered by the RFO; however, springs on BLM land may provide potential habitat for the species. It is reported to be "common" at 2 of the 3 localities, but due to its limited distribution, its overall population should be regarded as very low. The restricted habitat and distribution of the species suggest that threats to its survival are potentially great. Inventories for this species within potential habitat on RFO-administered land would be beneficial.

Southern Bonneville Pyrg *(Pyrgulopsis transversa)*

This species is known from 6 springs, all in north-central Utah; 4 of these localities are in Tooele County, 1 is in Utah County, and 1 is in Sanpete County. Although the population in Sanpete County is within the RFO planning area, it is not on BLM-administered land. Despite the relative abundance of this species being reported as "common" to "abundant," its restriction to 6 springs implies a low population. Inventories for this species within potential habitat on RFO-administered land would be beneficial.

Carinate Glenwood Pyrg *(Pyrgulopsis inopinata)*

There are 2 known populations of this species, both inhabiting springs near Glenwood in Sevier County. Neither population is on public land administered by the RFO; however, springs on BLM land may provide potential habitat for this species. This species is considered "scarce" at one locality, and at the other, it may be hybridizing with another species. Habitat degradation due to recreational use has occurred at these springs. The limited distribution and habitat degradation are threats to this species. Inventories for this species within potential habitat on RFO-administered land would be beneficial.

Smooth Glenwood Pyrg *(Pyrgulopsis chamberlini)*

There are 2 known populations of this species, both inhabiting springs near Glenwood in Sevier County. Neither population is on public land administered by the RFO; however, springs on BLM land may provide potential habitat for this species. This species was reported as "abundant"; however, because it occurs only in 2 closely associated springs, its overall abundance must be considered very low. The habitat used by this species is highly disturbed from recreational use. The threat to the continued existence of the species is considered high due to its limited distribution and the degradation of its habitat. Inventories for this species within potential habitat on RFO-administered land would be beneficial.

Black Canyon Pyrg *(Pyrgulopsis plicata)*

The single locality of occurrence for this species is described as a series of small springs emerging from a steep hillside in Black Canyon, East Fork Sevier River, Garfield County, Utah. It is reported as "common" at this locality; however, its overall abundance must be extremely low because it occurs in only one spring complex. This known population is on private land within the RFO planning area. Inventories for this species within potential habitat on RFO-administered land would be beneficial.

Amphibians

Western (Boreal) toad *(Bufo boreas)*

Often known as the Western toad, this species is widely scattered throughout the northwestern United States and Canada. It is found throughout much of Utah in a variety of habitats, including slow moving streams, wetlands, desert springs, ponds, lakes, meadows, and woodlands. Many of these habitats are located on lands administered by the RFO.

Great Plains toad (*Bufo cognatus)*

The Great Plains toad inhabits the central United States, much of Mexico, and limited areas of Canada. In Utah, the Great Plains toad occurs in scattered areas throughout the State, including portions of the RFO planning area, where it prefers desert, grassland, and agricultural habitats. This species breeds in shallow water after rains during spring and summer months. Females lay clutches of approximately 3,000 eggs, which hatch in several days. Adult toads eat insects primarily, whereas tadpoles eat plants, detritus, and algae. In cold winter months, the Great Plains toad burrows underground and becomes inactive. The Great Plains toad is usually light brown with darker brown or brownish-green irregular splotches.

Columbia spotted frog *(Rana luteiventris)*

This species is on the UDWR Sensitive Species List (UDWR 2003) as a Conservation Species, and a multi-agency conservation agreement was completed in 1998. In Utah, isolated Columbia spotted frog populations exist in the West Desert and along the Wasatch Front. Within these regions, populations are tied to aquatic habitat and perennial sources of water (Bosworth 2003). UDWR has documented populations of Columbia spotted frog in Sanpete, Sevier, Piute, Wayne, and Garfield counties.

Adult frogs eat a wide variety of food items, ranging from insects to snails, whereas tadpoles eat algae, plants, and small aquatic organisms. Typically, breeding sites have little or no current and are surrounded by dense aquatic vegetation. The Columbia spotted frog breeds as early in the spring as winter thaw allows, with eggs hatching in 3–21 days depending on temperature. During cold winter months, spotted frogs burrow in the mud and become inactive.

Populations are vulnerable to the loss and degradation of aquatic habitat. Historically, wetland destruction associated with development, as well as water withdrawal, pollution, livestock use, or competition from non-native species, have contributed to the species' decline (UDWR 2005a, NatureServe 2004).

Reptiles

Common chuckwalla *(Sauromalus ater)*

Chuckwallas are large lizards, sometimes exceeding 8 inches in length not including the tail. They occur in the southwestern United States and in parts of Mexico. In Utah, the species occurs only in the southern portion of the State, including areas of Garfield County administered by the RFO. Chuckwallas are predominantly found near cliffs, boulders, or rocky slopes, where they use rocks as basking sites and rock crevices for shelter. Chuckwallas are primarily herbivores, although they also consume insects. Female

chuckwallas lay 1 clutch of 5 to 15 eggs during the summer months. They are most active from spring through fall, remaining inactive in deep rock crevices during the cold of winter. They will also retreat into rock crevices during extreme heat.

Desert Night Lizard *(Xantusia vigilis)*

The desert night lizard is found in the southwestern United States and in Baja, California. In Utah, it occurs in a few small areas in the southern part of the State. It has been found in Garfield County on lands administered by the RFO. The desert night lizard is rarely seen because it is extremely secretive and spends much of its time under cover. It is a small lizard, only about 1.5 inches long, not including the tail. This species breeds in May and June. Females give birth to live young (usually 1 to 3) in late summer or early fall. The desert night lizard eats a variety of insects and other small invertebrates.

Birds

Bald Eagle (*Haliaeetus leucocephalus*)

The bald eagle, the national symbol of the United States, was first protected under the Bald Eagle Protection Act of 1940, and then later listed as an endangered species in most of the lower 48 states in 1966 and again in 1973. Since DDT was banned in 1972, the bald eagle has made a remarkable recovery throughout the United States. Its status was changed to threatened in 1995, and the bald eagle was delisted in 2007. Even though they are delisted, bald eagles are still protected by the MBTA and the Bald and Golden Eagle Protection Act. These Acts require some measures to continue to prevent bald eagle "take" resulting from human activities. The bald eagle is found throughout the State of Utah (more often seen in winter than summer). Habitat consists of communal winter roosting habitat and foraging habitat that is located within the RFO. Feeding areas, diurnal perches, and night roosts are fundamental elements of bald eagle winter range. In Utah, eagles nest in mature cottonwoods. Nesting has been documented in Wayne County (UDWR 2003). Wintering habitat exists within Sanpete, Sevier, Piute and Wayne counties. Fish and waterfowl are the primary sources of food for bald eagles, but they will also feed on rabbits, carrion, and small rodents.

American white pelican (*Pelecanus erythrorhynchos*)

The primary breeding habitat for this species is in the northern part of the State. However, during spring migration, the breeding season, and fall staging and migration periods, American white pelicans can be observed at many reservoirs throughout the State. Fall migration can extend from October through December, and birds typically return to Utah in early March. Within the RFO area, this species can be found on Piute and Otter Creek reservoirs.

The white pelican's primary food is fish, which is often sought in water less than 8.2 feet (2.5 meters) deep. White pelicans are diurnal and nocturnal foragers, and cooperative foraging is often used in shallow water. They forage mainly on "rough fish," which are often small (less than one-half bill length). Nesting in colonies and using cooperative flight and foraging strategies, pelicans are among the most gregarious and social of avian species. They are often observed sleeping, roosting, and sun bathing together. They are monogamous; pair formation occurs after arrival in Utah, typically the last week in March. For the colony as a whole, nest initiation extends over 3 months in Utah. The 2-egg clutch is incubated for 30 days. Nestlings are attended by parents for about 3 weeks; then the young congregate into pods.

Ferruginous hawk *(Buteo regalis)*

This species is distributed throughout much of Utah, although it is rare and productivity may not be sufficient to maintain the State's populations. Use of nesting substrate varies throughout this species'

range and includes trees, shrubs, cliffs, utility structures, and ground outcrops. Haystacks and abandoned buildings have also been used. Ferruginous hawk density varies regionally and temporally as prey densities vary. Their primary food source is small mammals, such as rabbits and hares, prairie dogs, and pocket gophers. Ferruginous hawk habitat is found in much of the area administered by the RFO. Threats include human disturbance (recreation, mineral development, etc.) and loss of preferred pinyon-juniper woodland habitats. The species is prone to abandon nest sites with low levels of human disturbance.

Greater sage-grouse *(Centrocercus urophasianus)*

This species inhabits sagebrush plains, foothills, and mountain valleys. Sagebrush is the predominant plant of quality habitat. The largest population of Greater sage-grouse in Utah is found in Wayne County. The species is also distributed throughout Sanpete, Sevier, Piute, and Garfield counties in areas dominated by sagebrush. An understory of grasses and forbs, as well as wet meadow areas, are essential elements of sage-grouse habitat, especially for survival of young chicks. The Greater sage-grouse is an herbivore, and insectivore and is associated with both tall and short sagebrush types. Sage-grouse use the same breeding grounds, or "leks," over several consecutive breeding seasons. Greater sage-grouse are ground nesters and are susceptible to predators and human disturbance, including mineral exploration and development and OHV use. Greater sage-grouse rely entirely on sagebrush for their winter diet and are found in sagebrush habitats during the winter months where the sagebrush remains above the level of the snow, or on windswept ridges where sagebrush is available as both forage and cover. Additional threats to the species include habitat loss, invasive plants, and conversion of large areas from shrub steppe to non-native grasslands (UDWR 2005a, NatureServe 2004).

Several research projects targeting the Greater sage-grouse population in the Parker Mountain area indicate that the population has increased from about 600 birds in 1997 to about 6,000 birds in 2007 (Guttery et al. 2007). The vitality of the Parker Mountain sage-grouse population is evidenced by the fact that this population is one of the few areas in Utah where sufficient numbers of breeding individuals are present to allow a limited annual harvest. (UDWR 2007). Monitoring indicates that the vegetation treatments in the Parker Mountain area provide greater vegetation diversity than untreated or control plots (Guttery et al. 2007). Monitoring in 2007 also discovered that most-sage-grouse pellets were found within fewer than 131 feet (40 meters) of intact sagebrush or treatment areas (Guttery et al. 2007).

Long-billed Curlew *(Numenius americanus)*

In Utah, this species is a fairly common summer resident and migrant. The curlew lives and breeds in higher and drier meadowlands than many other shorebird species. Uncultivated rangelands and pastures located within the planning area support the majority of breeding populations. Food sources include crustaceans, mollusks, worms, toads, insects, and sometimes berries. According to the UDWR, long-billed curlews have 4 essential nesting habitat requirements: short grass (less than 12 inches [30 cm]), bare ground components, shade, and abundant vertebrate prey.

Burrowing owl *(Speotyto cunicularia)*

This species prefers open areas within deserts, grasslands, and sagebrush steppe communities. Both primary and secondary breeding habitat exists in Sanpete, Sevier, Piute, Wayne, and Garfield counties. Habitat consists of well-drained, level-to-gently-sloping areas characterized by sparse vegetation and bare ground, such as moderately or heavily grazed pasture. Burrowing owls breed in native prairie as well as in cultivated pasture, hay fields, fallow fields, road and railroad rights-of-way (ROW), and in a number of urban habitats. They are obligate nesters that nest in ground burrows of prairie dogs or other burrowing mammals. Threats to the population include habitat loss, declining prairie dog populations, and pesticides (UDWR 2005a, NatureServe 2004).

Short-eared owl *(Asio flammeus)*

This is a medium-sized owl that frequently flies during daylight, especially at dusk and dawn, as it forages for rodents. The short-eared owl is usually found in grasslands, shrublands, and other open habitats common in the RFO. It is nomadic, often choosing a new breeding site each year, depending on local rodent densities. The owls nest on the ground in a small depression that is usually lined with a small amount of grass and other plant material. There is some concern that short-eared owl populations are declining in Utah.

Black swift *(Cypseloides niger)*

The black swift occurs in mountainous regions of the western United States and Canada. Little is known of the historic range of this species. Currently, black swifts occur in 3 widely separated areas, 1 of which is central Colorado through central Utah. They are thought to be extremely rare in Utah, with only 2 confirmed breeding locations. Black swifts are aerial insectivores and feed exclusively on flying insects. They nest is small colonies near and often behind waterfalls. Adults are long lived. Nesting sites are typically surrounded by coniferous forests, often mixed conifer or spruce-fir forests. The preferred habitat for the black swift is limited in the RFO.

Lewis's woodpecker *(Melanerpes lewis)*

This species ranges from southern British Columbia to its wintering grounds in northwestern Mexico. In Utah, it is primarily found in the central part of the State. The Lewis's woodpecker is a cavity nester, excavating a hole in tall trees that are often dead or blackened by fire. It will also nest in utility poles or stumps but prefers ponderosa pine, cottonwood, or sycamore, all of which are found within the RFO. The diet of this woodpecker consists of insects, nuts, and berries depending on the time of the year. Areas with a good understory of grasses and shrubs to support insect prey populations are preferred.

American three-toed woodpecker *(Picoides dorsalis)*

This species of woodpecker extends from Canada through Utah and into New Mexico. It is found in Engelmann spruce, subalpine fir, Douglas fir, ponderosa pine, tamarack, aspen, and lodgepole pine forests. This woodpecker tends to stay in its territory year-round, although insect outbreaks, such as spruce bark beetle infestations, may cause irregular movements. Habitat of the American three-toed woodpecker is found in the higher elevations of the RFO.

Northern goshawk *(Accipiter gentilis)*

The northern goshawk is found in much of the northern hemisphere. It is a permanent resident in Utah, but is not common in the State. The hawk prefers mature mountain forest and riparian zone habitats, both of which are found in the planning area. Nests are constructed in trees in mature forests. The northern goshawk often nests in the previously used nests of northern goshawks or other bird species. This species cruises low through forested areas and also perches to hunt prey. Major prey includes rabbits, hares, squirrels, and birds.

Grasshopper sparrow *(Ammodramus savannarum)*

This species of sparrow is a grasslands bird; therefore, potential habitat is limited in the RFO. In Utah, breeding populations have been found only in the northern parts of the State. Nests are built of grass on the ground at the base of grass clumps. As its name implies, this species' primary diet is grasshoppers.

Mammals

Fringed myotis *(Myotis thysanodes)*

This small bat is found in much of the western United States. It is widely distributed throughout Utah but is not very common in the State. The fringed myotis commonly inhabits caves, mines, and buildings, most often in desert and woodland areas, which are common in the RFO. Beetles are the major prey for this species.

Western red bat *(Lasiurus blossevilli)*

The Western red bat is found in the western United States. It is extremely rare in Utah and is known to inhabit only a few locations in the State. As a result, it is included on the UDWR Sensitive Species List. This species of bat is normally found near water, often in wooded areas. While some individuals hibernate during cold times, most will migrate south to warmer climates for the winter. The species is nocturnal. It feeds on insects, often foraging near riparian areas.

Spotted bat *(Euderma maculatum)*

This species occurs throughout much of the western United States. It is found statewide in Utah, but has probably never been abundant in any particular location. The spotted bat may be found in a variety of habitats, ranging from deserts to forested mountains. It roosts and hibernates in caves and rock crevices. These types of habitats are scattered throughout the RFO. Spotted bats eat insects, primarily moths, which are captured in flight. Current data suggest that populations of this species may be declining in Utah. Consequently, the spotted bat is now included on the UDWR Sensitive Species List.

Townsend's big-eared bat *(Corynorhinus stownsendii)*

This species occurs in western North America from southwestern Canada to Mexico. In Utah, it occurs statewide at elevations below 9,000 feet. Townsend's big-eared bat can be found in many types of habitat, but is often found near forested areas. Caves, mines, and buildings are used for day roosting and winter hibernation. The species is nocturnal, and individuals typically do not leave their roosts until well after sunset. This species is thought to be declining in population in Utah due to human disturbances of caves and the closings of abandoned mines.

Allen's big-eared bat *(Idionycteris phyllotis)*

Allen's big-eared bat is one of the most poorly known bat species in North America. It was not known to inhabit Utah until 1969. It is known to occur only in the southern portion of the State. Because of its rarity, this species is included on the UDWR Utah Sensitive Species List. Preferred habitats include rocky and riparian areas in woodland and scrubland regions. Allen's big-eared bat is an insectivore, eating insects captured in flight or plucked from vegetation. It is nocturnal, roosting in caves or rock crevices during the day.

Big free-tailed bat *(Nyctinomops macrotis)*

This species is found in the western United States. It is rare in Utah, occurring primarily in the southern half of the State. The big free-tailed bat prefers rocky and woodland habitats. Roosting occurs in caves, mines, old buildings, and rock crevices. It is typically active year-round, migrating to warmer areas in the south during the winter months. This species eats insects, primarily moths.

Pygmy rabbit *(Brachylagus idahoensis)*

This species can be found throughout Utah, including within the RFO. The pygmy rabbit habitat in the RFO is limited to 1 percent of the planning area. The species prefers areas with tall, dense sagebrush and loose soils. Pygmy rabbits occur in isolated patches because of their specific life history requirements. Their habitat consists of deep soils and tall, dense sagebrush and high shrub cover. Pygmy rabbits are active throughout the year and are most often above ground near dawn and dusk. Inactive periods are spent in underground burrows. Pygmy rabbits depend on sagebrush for their winter diets and during summer shift to more grasses and forbs. Declines in population are related to the degradation or loss of sagebrush steppe habitat. If actions were proposed in pygmy rabbit habitat, site-specific National Environmental Policy Act (NEPA) provisions would be needed to address restrictions (e.g., avoidance or mitigation) around pygmy rabbit habitat.

Kit fox *(Vulpes macrotis)*

The kit fox is the smallest canid in North America. It is found exclusively in arid and semi-arid landscapes and occupies habitats that provide favorable combinations of low predator abundance, sufficient prey, and soils suitable for denning. The kit fox is one of the few canids in the world to use year-round dens which provide protection from predators, aid in thermoregulation, and reduce water loss. The kit fox opportunistically eats small mammals (primarily rabbits and hares), small birds, invertebrates, and plant matter. It is capable of meeting all its water requirements metabolically without the need for drinking water. The fox is primarily nocturnal. It mates in late winter, with 4 to 7 pups being born about 2 months later.

There are many threats to the kit fox in Utah. Invasive weeds affect their prey base by decreasing small mammal diversity and abundance. To compensate for a reduced prey base, kit fox home ranges become larger, fecundity declines, and dispersing young are required to travel further making them more vulnerable to predators. Water developments for game and livestock effectively decrease the amount of arid lands suitable only for kit fox occupation. Increased year-round availability of water in the most arid areas of Utah serves to extend the distribution of coyotes and red fox, which prey upon kit fox, into areas previously too arid to support them. Competitive interactions with larger canids, especially when populations are already depressed, can have major effects on kit fox populations.

Fish

Bonneville cutthroat trout *(Oncorhynchus clarki utah)*

The Bonneville cutthroat trout is a subspecies of the cutthroat trout native to the Bonneville Basin of Utah, Wyoming, Idaho, and Nevada. Pure Bonneville cutthroat trout are rare throughout their historic habitat, but several populations exist in Utah, including within the RFO. Major threats to this species include habitat loss/alterations, predation by and competition with non-native fishes, and hybridization with non-native fishes, such as the rainbow trout. This species feeds primarily on insects, but large individuals also eat fishes. It can be found in a variety of habitats ranging from high-elevation mountain streams and lakes to low-elevation grassland streams. In all of these habitat types, the Bonneville cutthroat trout requires a functioning stream riparian zone that provides structure, cover, shade, and bank stability.

Colorado River cutthroat trout *(Oncorhynchus clarki pleuriticus)*

This species is a race, or subspecies, of the cutthroat trout that is native to the upper Colorado River drainage of Utah, Wyoming, Colorado, Arizona, and New Mexico. This subspecies is restricted to the upper Colorado River drainage and occurs in headwater streams and mountain lakes of the Uinta, La Sal,

and Abajo Mountains; the Tavaputs Plateau; and the Escalante and Fremont River drainages (Bosworth 2003). UDWR has documented cutthroat trout populations within Sevier, Wayne, and Garfield counties within the planning area (UDWR 2005a).

The Colorado River cutthroat trout eats primarily invertebrates, but adults also eat small fishes. Like other cutthroat trout, the subspecies spawns in streams over gravel substrate in the spring. The cool, clear water of high-elevation streams and lakes is the preferred habitat for Colorado River cutthroat trout (Bosworth 2003).

Threats to the species include land and water use activities such as grazing, mining, and the construction of water impoundments, as well as the introduction of non-native fish. In addition, fragmentation of metapopulations, which affects gene flow and seasonal movements, is thought to be an especially important factor in population declines (Bosworth 2003). UDWR is currently working to restore pure Colorado River cutthroat trout to historic areas in Utah. Since 1999, large numbers of Colorado River cutthroat trout have been raised in hatcheries and then released into lakes in the Uinta Mountains in the northeastern part of the State.

Southern leatherside chub *(Lepidomeda aliciae)*

Recent genetic evidence shows that the leatherside chub, *Gilia copei*, separated into two distinct species—the northern leatherside chub, *Lepidomeda copei*, and the southern leatherside chub, *Lepidomeda aliciae*, whose range includes portions of the RFO. The leatherside chub is a small minnow native to streams and rivers of the southwestern portion of the Bonneville Basin. It was once common throughout its native range but presently is listed as a State sensitive species due to substantial decreases in population levels.

Roundtail chub *(Gilia robusta)*

This species is a fairly large minnow native to the Colorado River system of the western United States. It prefers large rivers and is most often found in murky pools near strong currents in the main-stem Colorado River and tributaries. Locally common in places, the roundtail chub has been reduced in numbers and distribution due to flow alteration and the introduction of exotic fishes. It eats terrestrial and aquatic insects, mollusks, and other invertebrates, fishes, and algae.

Bluehead sucker *(Catostomus discobolus)*

The bluehead sucker is native to parts of Utah, Idaho, Arizona, New Mexico, and Wyoming. Specifically, the species occurs in the upper Colorado River system, the Snake River system, and the Lake Bonneville Basin. In Utah, bluehead suckers have been reduced in numbers and distribution due to stream flow alteration, habitat loss/alteration, and the introduction of non-native fishes. It is a benthic (bottom dwelling) species with a mouth modified to scrape algae from the surface of rocks. Fast-flowing water in high gradient reaches of mountain rivers has been identified as important habitat for this species.

Flannelmouth sucker *(Catostomus latipinnis)*

This species is native to the Colorado River system of the western United States and northern Mexico. In Utah, the species occurs in the main-stem Colorado River and in many of the Colorado's large tributaries. Flannelmouth suckers are usually absent from impoundments. The species prefers large rivers, where it is often found in deep pools of slow-flowing, low-gradient reaches. The sucker is a benthic (bottom dwelling) fish that eats primarily algae. Invertebrates and many types of plant matter are also consumed. Utah flannelmouth sucker populations have recently been reduced in numbers and distribution, primarily due to flow alteration, habitat loss/alteration, and the introduction of non-native fishes.

Plants

Rabbit Valley gilia *(Gilia cespitosa or Alicella cespitosa)*

Rabbit Valley gilia (also known as Wonderland Alice-flower) is a federal candidate for listing under the ESA and occurs in Wayne County. Rabbit Valley gilia is primarily associated with Navajo Sandstone and to a lesser extent, the Kayenta and Wingate Formations. Growing in sand-filled crevices, sand pockets, and on detrital slopes, it is found in open pinyon-juniper woodlands, often mixed with mountain brush, sagebrush, or ponderosa pine, at elevations ranging from 5,198 to 8,997 feet (Clark and Clark 1999). Rabbit Valley gilia is known from 15 populations scattered over a distance of about 19 miles near the Fremont River from the northern portion of the Waterpocket Fold westward to Rabbit Valley in Wayne County, an area locally known as Wayne Wonderland. Threats to the population include plant collection and trampling associated with recreation and livestock grazing (NatureServe 2004).

Utah phacelia *(Phacelia utahensis)*

This central Utah endemic species occurs in portions of Sanpete and Sevier counties. It is found on often-precipitous, barren slopes of the Arapien Shale Formation. The plant grows in desert shrub and pinyon-juniper woodland communities. Alder-leaf mountain mahogany, shadscale, and Utah greasebush communities are also known to contain populations. The plant grows at elevations ranging from 5,500 to 6,200 feet. Evidence of gypsum mining has been observed over much of the habitat, and the plants were never observed occupying disturbed locations. Livestock grazing and off-highway vehicle use are present, but due to the often steep habitat, are not a concern at all locations. The recent discovery of oil in the Sevier Valley may add another potential impact to this plant's habitat (Utah Native Plant Society 2007, UDWR 2005d).

Basalt (or Silver) milkvetch *(Astragalus subcinereus var. basalticus)*

The basalt milkvetch is found in eastern Sevier and western Garfield and Emery counties in Utah. It prefers pinyon-juniper woodland and ponderosa pine communities on igneous gravels between 4,500 and 8,000 feet in elevation (Utah Native Plant Society 2007).

Pinnate spring parsley *(Cymopterus beckii)*

This species is found in pinyon-juniper woodland, mountain brush, ponderosa pine/Manzanita, conifer/oak, and Douglas fir communities in sandy or stony soils. It is often found in rock crevices and near cliff bases on north and east exposures between 5,600 and 7,500 feet in elevation. It is endemic to San Juan and Wayne counties in Utah and Navajo Tribal Lands in Arizona (Utah Native Plant Society 2007).

Creutzfeldt cryptanth (Cryptantha creutzfeldtii)

This species is endemic to central Utah in Carbon, Emery, and Sevier counties. It inhabits shadscale and mat *Atriplex* communities on the Mancos shale formation between 5,250 and 6,500 feet. It flowers from late April through June (Utah Native Plant Society 2007).

Hole-in-the-Rock prairie-clover *(Dalea flavescens var. epica)*

This species is endemic to Utah in Carbon, Emery, Garfield, Kane, San Juan, and Wayne counties. It grows on sandstone bedrock and sandy areas in blackbrush and mixed desert shrub communities between 4,700 and 5,000 feet in elevation (Utah Native Plant Society 2007).

Cronquist wild buckwheat *(Eriogonium corymbosum var. cronquistii)*

Cronquist wild buckwheat is endemic to the Henry Mountains in Garfield and Wayne counties in Utah. It is found almost entirely on public lands administered by the BLM RFO. The species prefers pinyon, *Holodiscus*, rabbitbrush, mountain brush, and rock-spirea communities. It occurs on steep talus slopes between 8,800 and 8,900 feet in elevation (Utah Native Plant Society 2007).

Smith (or Flat Tops) wild buckwheat *(Eriogonum corymbosum var. smithii)*

This species is located in the San Rafael Desert portion of Emery and Wayne counties in Utah. It is endemic to the Colorado Plateau. The plant is a perennial shrub with bright yellow flowers and shiny green leaves. It is found in purple sage, matchweed, Ephedra-Indian rice grass, desert shrub, and rabbitbrush communities on the Entrada Formation and on stabilized sand dunes between 4,500 and 5,600 feet in elevation. Livestock currently graze in the habitat of this species but do not appear to be a threat to the plant. The potential also exists for oil and gas related activity to occur within the habitat of this species (Utah Native Plant Society 2007; UDWR 2007).

Utah spurge *(Euphorbia nephradenia)*

Endemic to the Colorado Plateau, the Utah spurge is found in Emery, Garfield, Kane, and Wayne counties. It is found in mat saltbush, blackbrush, Ephedra, mixed sandy desert shrub, and grassland communities on dark clay hills, blown sand, and stabilized dunes mainly on Tropic Shale and Entrada Formations between 3,800 and 4,800 feet in elevation (Utah Native Plant Society 2007).

Cataract gilia *(Gilia latifolia var. imperialis)*

Cataract gilia is endemic to Emery, Garfield, Grand, Kane, San Juan, and Wayne counties, Utah. It is found in shadscale and other mixed desert shrub communities, especially in wash bottoms and at the bases of ledges between 3,800 and 5,200 feet in elevation (Utah Native Plant Society 2007).

Mussentuchit gilia *(Gilia tenuis)*

This species is known from 7 locations in Emery and Sevier counties (NatureServe 2004 and Utah Native Plant Society 2004). The species is restricted to a discontinuous stretch of habitat of sandstone outcrops and sandy slopes in association with mountain brush, pinyon-juniper woodlands, and cushion plants (NatureServe 2004). Often Mussentuchit gilia is located on material derived from the Curtis Formation and the Dakota and Navajo sandstones, between 5,198 and 7,117 feet in elevation (Welsh *et al*. 1993 and Utah Native Plant Society 2004). The number of plants is not recorded for the population located within the planning area, and no threats have been identified to either the populations or habitat (UNHP 2004, NatureServe 2004).

Alcove bog-orchid *(Habenaria zothecina)*

Alcove bog-orchid is located in Emery, Garfield, Grand, San Juan, and Uintah counties in Utah and in Arizona and Colorado. It is found in seeps, hanging gardens, and moist stream banks in mixed desert shrub, pinyon-juniper woodland, and oak brush communities between 4,000 and 6,200 feet in elevation (Utah Native Plant Society 2007).

Greenwood's goldenbush *(Haplopappus lignumviridis)*

The habitat of this very rare species is restricted to riparian areas with willows, nettles, and *Conyza* in Sevier County, Utah. It is found at about 6,200 feet in elevation (Utah Native Plant Society 2007).

Claron pepperplant *(Lepidium montanum var. claronense)*

The Claron pepperplant is endemic to the Paunsaugunt and Table Cliff Plateau in Garfield, Kane, and Piute counties in Utah. It is restricted to sagebrush, pinyon-juniper woodland communities, and ponderosa pine/bristlecone pine communities on the Claron member of the Wasatch Limestone Formation and other fine textured substrates between 6,400 and 8,000 feet in elevation (Utah Native Plant Society 2007).

Entrada pinkrush (Lygodesmia grandiflora var. entrada)

This species is endemic to Emery, Grand, and San Juan counties with potential habitat within the RFO area. It occurs in mixed desert shrub and juniper communities between 4,400 and 4,800 feet in elevation and flowers in June (Utah Native Plant Society 2007).

Arapien blazingstar (*Mentzelia argillosa*)

The Arapien blazingstar is a rare plant endemic to the Arapien shale in Sevier and Sanpete counties. It occurs at elevations ranging from about 5,600 to 6,300 feet. It is sympatric with *Phacelia utahensis* and *Townsendia jonesii* var. *lutea*, both BLM sensitive species.

Jones' indigo-bush (*Psorothamnus polydenius jonesii)*

This species is endemic to Emery, Grand, and Wayne counties. It inhabits shadscale, mat-saltbush, Ephedra, and galleta communities on the Mancos shale formation (Blue Gate and Tununk members) and less commonly sandy terrace gravels. It occurs at elevations ranging from 4,200 to 4,900 feet and flowers late May–July (Utah Native Plant Society 2007).

Jane's globemallow *(Sphaeralcea janeae)*

This rare species is endemic to Wayne and San Juan counties in Utah. It prefers warm and salt desert shrub communities on the White Rim and Organ Rock members of the Cutler Formation between 4,000 and 4,600 feet in elevation (Utah Native Plant Society 2007).

Psoralea globemallow *(Sphaeralcea psoraloides)*

This species is endemic to the Colorado Plateau and is found on the southeastern footslopes of the San Rafael Swell in Wayne and Emery counties, Utah. It is typically found in *Zuckia-Ephedra*, shadscale, *Eriogonum*, *Lepidium*, and pinyon-juniper woodland communities. Soil types on which the psoralea globemallow is found include saline and gypsiferous Mancos Shale, Buckhorn Conglomerate, Curtis sandstone, Entrada siltstone, Carmel, and Kaibab Limestone between 4,000 and 6,300 feet in elevation. Researchers visiting populations of this species have noted OHV use, grazing, recreation, exotic weed encroachment, mining, and urbanization occurring within the habitat. However, the species appears to be stable at this time (Utah Native Plant Society 2007, UDWR 2005d).

Alpine greenthread *(Thelesperma subnudum var. alpinum also known as Thelesperma windhamii)*

The alpine greenthread is a rare species endemic to portions of Wayne County, Utah. It occurs in pinyon-juniper communities, mountain brush, and western bristlecone pine communities. The plant grows in sandy soil pockets, cracks of slickrock, and on ledges and clay flats on Carmel Limestone and Navajo Sandstone between 6,000 and 8,000 feet in elevation. The known populations of this species are fairly isolated (Utah Native Plant Society 2007; UDWR 2005d).

Sigurd townsendia *(Townsendia jonesii var. lutea)*

This very rare species is found in Juab, Piute, Sanpete, and Sevier counties in Utah. Its habitat is salt desert, mixed desert shrub, and juniper-sagebrush communities on Arapien shale and clays in volcanic rubble at 3,500 to 6,300 feet elevation (Utah Native Plant Society 2007).

3.3.9 Fish and Wildlife

The BLM manages public lands to provide habitat for fish and wildlife. The diverse ecosystems and mosaic landscapes of the lands managed by the RFO provide habitat for more than 600 species of fish and wildlife. Fish and wildlife habitat are managed according to principles outlined by *Utah Fish and Wildlife 2000* (BLM 1993b). The BLM implements this general guidance through specific management actions associated with species located in the public lands managed by the RFO.

The BLM manages wildlife habitat, and the UDWR manages wildlife populations. To the extent practicable, the BLM collaborates with UDWR to achieve the habitat management goals and objectives of the various UDWR Wildlife Management Unit Plans, as well as species-specific management plans, by providing appropriate quantities and quality of habitats on public lands, consistent with the principles of multiple-use management. These habitats reflect the influence of various past and ongoing human activities and disturbances, resulting in significant increases in some species populations, declines in others, and the modification of large blocks of habitat. The habitats and the wildlife species that rely on them rarely exist solely on BLM lands and often extend across administrative boundaries to other federal, state, and private lands.

Fish and wildlife species can be broadly defined in 2 management categories that reflect preferences in public interest. Some species, commonly called game species, are economically important for hunting, fishing, and wildlife viewing opportunities. Others that do not have direct economic importance for hunting and fishing are referred to as non-game species. Both categories have economic importance that varies locally and nationally. Species not specifically discussed in this plan are also important and contribute to the diversity and health of plant and animal communities on public land. Many species fill ecological roles that are important but not fully understood.

3.3.9.1 Fish and Fisheries Habitat

Fisheries habitat includes perennial and intermittent streams and flat water (e.g., lakes and reservoirs) that support fish through at least a portion of the year. The condition of fisheries habitat is related to riparian habitat and stream channel characteristics. Riparian vegetation moderates water temperatures and provides bank structures that reduce erosion and provide overhead vegetation cover for fish. Intact riparian communities also serve to slow overland flow, capture sediments, and provide a filter that enhances water quality. Water quality, especially factors such as sediment, temperature, and dissolved oxygen, also greatly affects fisheries habitat.

Streams and lakes in the RFO provide habitat for at least 30 species of warm- and cool-to cold-water fish species, with 18 of these considered game fish (Sigler and Sigler 1996). Past stocking efforts have established many non-native fish species in streams, lakes, and reservoirs. Aquatic invertebrates and amphibians are integral components of all fish communities.

The factors limiting or affecting fish habitat in the RFO include excess siltation, elevated water temperatures, stream dewatering, riparian areas in less than PFC, livestock impacts, and past mining practices. Factors limiting or affecting native fish production include competition and predation from non-native species, stream dewatering, hybridization, fish loss through irrigation diversions, excess siltation, and isolation of populations.

3.3.9.2 Wildlife and Wildlife Habitat

Wildlife habitat can be segregated into 7 types: desert shrub, sagebrush steppe, pinyon-juniper woodland, forested, riparian/wetland, aspen, and non-vegetated (cliff talus). These habitat types are used as a basis

for describing existing conditions, focusing on a broader scale approach as opposed to single-species management.

Livestock grazing, fire suppression, development patterns, natural conditions, and introduced plant species have influenced the condition of the habitats. When management focuses on habitat condition and composition rather than on individual species, a more ecological effect is achieved on wildlife species than when focused on an individual species. Disturbances enhance habitat for some species but limit opportunities for others. Generally, disturbances promote use by mobile species or species that tolerate a broad range of habitat conditions. The availability of habitat may vary during the year as a result of elevation, aspect, and proximity of disturbance. Habitat use is also limited by wildlife species' different levels of social tolerance and by learned or inherent behavior. These factors may limit movement of wildlife species into new habitats even if the habitat appears suitable for the species' needs.

Wildlife habitat needs vary significantly by species. It is generally true that healthy and sustainable wildlife populations can be supported where there is a diverse mix of vegetation communities to supply structure, forage, cover, and other specific habitat requirements.

Desert Shrub

Desert shrub includes numerous upland vegetation communities with a shrubland component and a variable understory of grass and forbs. Desert shrub contains a large number of reptile species. A variety of other wildlife occupies salt desert habitats. Herbaceous plants are vital to the majority of all wildlife species because they provide food, cover, and structure. Shrub cover helps wildlife survive the rigors of summer heat and winter cold. It supplies browse, seeds, and cover for birds and small and large mammals. Intermingled areas of desert grasslands add diversity to vegetation and habitat structure in desert shrub communities.

Sagebrush Steppe

Sagebrush habitat is prevalent in the western and central portions of the RFO. At mid to lower elevations, Wyoming big sagebrush is the dominant vegetation type, providing important winter habitat for highly mobile wildlife species (e.g., mule deer, pronghorn, and Greater sage-grouse) and localized yearlong habitat for sagebrush-obligate species (e.g., pygmy rabbit). Sagebrush also provides crucial breeding, nesting, and brood-rearing habitat for these species. Intermingled occurrences of grasslands and several low sages add to the diversity of vegetation and habitat structure. Sagebrush-obligate species are restricted to sagebrush habitats during the breeding season or year round, and near-obligate species occur in both sagebrush and grassland habitats. As a consequence of the regional losses of sagebrush communities and the number of sagebrush-obligate wildlife, maintenance and improvement of existing sagebrush habitat are crucial for community structure and diversity and for providing critical habitat for obligate species.

Pinyon-Juniper Woodlands

Pinyon-juniper woodlands are widely dispersed and have expanded into sagebrush and other vegetation communities. Pinyon-juniper woodlands provide some wildlife habitat. Although understory vegetation is reduced beneath pinyon-juniper stands, pinyon-juniper woodlands provide greater structural diversity than desert shrub or sagebrush steppe shrubland habitats.

Forested Areas

Coniferous habitats are a small but important habitat component within the RFO and are primarily located along national forest boundaries and in the Henry Mountains. Forested habitats, which provide security areas (e.g., hiding cover) for big game species, can provide important linkage corridors for wildlife movement between other seasonal habitats.

Riparian Ecosystems

Riparian habitats are crucial components in the landscape. They serve as important use areas for wildlife in providing various life-cycle requirements such as foraging, nesting, roosting, and hiding cover, as well as travel corridors for numerous highly mobile species. Usually a high degree of plant diversity occurs along riparian corridors, exhibiting variable density and composition, allowing both openness and ground cover. Invasive species, such as tamarisk, are degrading the health of riparian systems, shifting the systems to a vegetation monoculture.

Aspen

Aspen stands provide habitat for many wildlife species. Many predaceous birds are adapted to aspen forest and the adjacent open brush, meadows, and grasslands. Aspen ecosystems provide cover, calving, and fawning habitat for big game, and nesting habitat for migratory birds.

Non-Vegetated (Cliff Talus)

Talus slopes are accumulations of angular rock debris at the bases of cliffs or steep slopes. Talus provides wildlife species with basking sites and crevices for hiding. Slopes with large boulders provide caves that may be large enough for a species such as bobcat to occupy. Cliffs are faces of vertical exposed rock that sometimes have a talus slope at their base. Several raptor species and non-perching birds, such as black swifts, use cliff and talus areas for nesting and brood-rearing habitat. Prairie falcons generally nest on rock outcrops and cliffs that range from 30 to 400 feet high. Canyon and rock wrens nest in the fractured talus slope below cliff faces, particularly in areas interspersed with open, patchy forests of ponderosa pine, Douglas fir, and sagebrush steppe communities.

3.3.9.3 Wildlife Species of Interest

Wildlife species of interest include big game animals, raptors, upland game birds, and other species. Big game populations are managed cooperatively by the BLM and UDWR based on habitat condition, long-term vegetative trends, annual monitoring of wildlife utilization levels, and the desired age class of animals produced in each Wildlife Management Unit. UDWR establishes Wildlife Management Unit boundaries to encompass the seasonal habitat requirements of large, free-roaming wildlife species, and they are frequently bounded by such physical features as ridgetops or drainages, or artificial features such as major roads or highways. Boundaries of Wildlife Management Units rarely match the administrative boundary of the RFO.

Seasonal habitats are mapped in the GIS and represent an outside perimeter within which a particular seasonal use could be expected to occur by a particular species. However, the mapping is not precise because distribution varies annually as a result of weather, forage availability, and population size and distribution. Some areas do not lend themselves to a particular use as a result of topography, different vegetation, or disturbances that are too small to map on a broad scale (e.g., north slopes on winter ranges, forested patches in sagebrush). The RFO includes all or portions of the following UDWR Wildlife Management Units—

- Beaver
- Central Mountains, Manti South
- Fillmore
- Henry Mountains
- Monroe
- Mount Dutton
- Plateau Boulder
- Plateau Fishlake
- Plateau Thousand Lake

- San Rafael.

Game Wildlife Species

Crucial habitats for big game species are included within the RFO (Maps 3-5, 3-6, and 3-7). Crucial-value habitat is any range or habitat component that directly limits a community from reproducing or maintaining a certain population level over the long term. Moderate-value and low-value habitat is abundant in the planning area, and includes any particular habitat that is common or of intermediate importance. Wildlife may be displaced due to development activities in these habitats.

Bison

The Henry Mountains are the habitat of the only free-roaming and huntable herd of American bison on public land in the 48 contiguous United States. The herd was transplanted to the San Rafael Desert in the 1940s and migrated into the Henry Mountains in the 1960s (Map 3-5). Bison are grazers, feeding mainly on grasses and other vegetation. Although bison typically give birth in spring, young may be born as late as midsummer. An annual hunt is held to maintain a harvest population of about 275 animals. Conflicts with livestock and bison grazing occur on allotments where both are present. Drought increases the potential for conflict between livestock and bison.

Bighorn Sheep

Desert bighorn sheep are found in the Dirty Devil portion of the San Rafael Wildlife Management Unit. Desert bighorn sheep are considered to be yearlong residents of their range—they do not have seasonal ranges like mule deer and elk (Map 3-5). Bighorn sheep prefer very open vegetation types, such as low shrub, grassland, and other treeless types typically associated with steep talus and rubble slopes. Bighorn sheep diets comprise a variety of shrubs, forbs, and grasses. Bighorn sheep lambing occurs on steep talus slopes, typically within 1 to 2 miles of reliable water sources.

Bighorn sheep are extremely vulnerable to a variety of viral and bacterial diseases carried by livestock, principally by domestic sheep. In some cases reported in the literature, exposures to some of these diseases have resulted in the decimation of entire bighorn populations. The diseases are transmitted in numerous ways, including nose-to-nose contact and wet soils associated with areas of concentrated use, such as stock watering ponds. The BLM has adopted guidelines for domestic sheep grazing in or near bighorn sheep habitat to prevent the spread of disease.

Management of bighorn sheep is guided by 3 herd management plans and guidelines: The *Utah BLM Statewide Desert Bighorn Sheep Management Plan* (BLM 1986), *Revised Guidelines for Domestic Sheep and Goat Management in Native Wild Sheep Habitats* (BLM 1998a), and the *Utah Bighorn Sheep Statewide Management Plan* (UDWR 1999). Additional guidance is found in the *Henry Mountains Desert Bighorn Sheep Habitat Management Plan* (BLM 1990a).

Pronghorn

There are 5 Wildlife Management Units that contain pronghorn habitat within the planning area (San Rafael, Henry Mountains, Plateau, Monroe, and a portion of Mt. Dutton). Pronghorn prefer very open vegetative habitat types, such as salt desert shrub, grassland, and other treeless types. Typically, pronghorn avoid slopes greater than 20 percent. Pronghorn fawning occurs throughout the range of the species (Map 3-5). Pronghorn diets comprise a variety of forbs, shrubs, and grasses. Forbs are of particular importance during spring and summer, and shrubs are more important during the winter.

Mule Deer

There are 6 mule deer Wildlife Management Units that occur in the planning area. Mule deer are migratory, moving seasonally between summer and winter ranges (Map 3-6). Mule deer usually summer at high elevations and winter at low elevations. Their diet consists largely of sagebrush, primarily

Wyoming sagebrush. Shrubs such as true mountain mahogany, fourwing saltbush, and antelope bitterbrush are important winter forage species. Mule deer fawn during the spring on their migration back to their summer range.

Mule deer have a high degree of fidelity to specific winter ranges, where high population densities concentrate on relatively small areas. Because of the relatively small winter range area, high population densities, and the natural stress of winter survival, mule deer are vulnerable to stress caused by human activity in winter range areas, such as antler hunting and other recreational activities. Mule deer are displaced an average of 600 feet from areas of human activity.

Elk

The planning area includes portions of 4 elk Wildlife Management Units: Plateau, Monroe, Beaver, and Mt. Dutton (Map 3-7). Elk are migratory, moving seasonally between summer and winter ranges. They summer at higher elevation ranges in aspen and forested habitats, where their diet consists primarily of grasses and forbs. Elk calve during late spring and early summer in aspen-mountain browse, intermixed vegetation types. Elk winter at mid-to-lower elevation ranges, occupying the sagebrush and woodland habitat types and congregating in herds of 50 to 200 or more. Human activity in elk winter range intensifies the natural stress of winter survival.

Black Bear

Black bear is currently the only bear species inhabiting Utah. Black bears are native to Utah and are fairly common. In the planning area, black bears are present in Wayne and Garfield counties, where they can be found primarily in large forested areas.

Cougar

Cougar, or mountain lions, are found statewide in Utah, occupying habitat types ranging from rugged desert areas to above the timberline. The species is fairly common throughout Utah, but individuals are rarely seen because of their secretive nature. Seasonally, their movements follow their main prey: mule deer. Cougar will also feed on rabbits, elk, or other animals, but about 80 percent of their diet consists of deer. Cougars are active year-round, during day and night, although most activity occurs at dawn and dusk. They are hunted on a limited and closely monitored basis in Utah.

Furbearers

Several furbearer species are found in the planning area. Furbearers, as defined by UDWR, include bobcats, raccoons, badgers, weasels, red fox, and beavers. Red fox are found throughout the planning area, and numbers are relatively high. Bobcats are fairly common in Utah; however, they are rarely seen due to their secretive nature.

Upland Game Birds

The lands managed by the RFO provide important migration, nesting, and winter habitats for upland game birds. Upland species include Greater sage-grouse, blue grouse, pheasants, and quail. (Greater sage-grouse are discussed in more detail in Section 3.1.1, Special Status Species.) Upland species feed frequently on upland grasses and forbs in grassy fields and meadows, where such vegetation is succulent and sufficiently open to enable rapid flight and avoidance of harboring predators. Such habitats support upland game birds year round.

Other Non-game Species

Information on small mammals, bats, reptiles, and amphibians is lacking. Databases maintained by the Utah Natural Heritage Program document general occurrences and potential for many of these groups of wildlife, but site-specific inventories have not been conducted for most of the RFO. However, as

inventories are conducted, new occurrences and range extensions are being discovered, which emphasizes the need for more comprehensive work.

3.3.9.4 Migratory Birds

Migratory birds have been protected by treaty (with Great Britain) since 1916 and by law under the MBTA since 1918. In EO 13186, Responsibilities of Federal Agencies to Protect Migratory Birds, signed by President Clinton in 2001, federal agencies were directed to "design migratory bird habitat and population conservation principles, measures, and practices into agency plans and planning processes…." Bird Habitat Conservation Areas (BHCA) were identified in an effort to focus cooperative migratory bird habitat enhancement or restoration efforts in these important areas. The BHCAs are not special designations and do not require additional regulation. In the *Coordinated Implementation Plan for Bird Conservation in Utah* (IWJV 2005), 3 BHCAs were identified on lands managed by the RFO:

- **BHCA 30:** Sevier Bridge/Chicken Creek Reservoirs—open water with large marsh areas
- **BHCA 43:** Parker Mountain—sagebrush-steppe habitat
- **BHCA 51:** Henry Mountains (north of Mount Ellen)—mountain riparian habitat.

Neotropical migratory birds are found in all habitats within the planning area (Parrish *et al.* 2002). These birds include a diverse array of species, such as hummingbirds, finches, flycatchers, warblers, thrushes, and orioles. Most of these birds are summer residents that use habitats ranging from lower elevation wetlands to high-elevation forests for breeding and raising young. Some species, such as the American robin and mallard, are migratory, but small populations may be present yearlong depending on seasonal conditions. Winter residents, such as rough-legged hawk, snow buntings, and rosy-crowned gray finches, arrive from arctic breeding grounds or high-elevation, alpine areas to use winter habitats in lower elevation foothills and major river valleys, seasonally replacing summer residents.

The following list includes birds on the *USFWS Birds of Conservation Concern (BCC) 2002* list and the *Utah Partners in Flight (PIF) Priority Species for Conservation* that may inhabit the RFO area based on RFO data and information in the UDWR's Utah Conservation Data Center (http://dwrcdc.nr.utah.gov/ucdc/).

Table 3-17. Birds of Conservation Concern within the Richfield Field Office

Common Name	Scientific Name	BCC List[1]	PIF List[2]
Marbled Godwit	*Limosa fedoa*	X	
Wilson's Phalarope	*Phalaropus tricolor*	X	
American Avocet	*Recurvirostra americana*	X	X
Solitary Sandpiper	*Tringa solitaria*	X	
Long-billed Curlew	*Numenius americanus*	X	X
American White Pelican	*Pelecanus erythrorhynchos*		X
Black-necked Stilt	*Himantopus mexicanus*		X
Western Yellow-billed Cuckoo	*Coccyzus americanus*	X	X
Black Swift	*Cypseloides niger*	X	X
Broad-tailed Hummingbird	*Selasphorus platycercus*		X
Golden Eagle	*Aquila chrysaetos*	X	

Common Name	Scientific Name	BCC List[1]	PIF List[2]
Peregrine Falcon	*Falco peregrinus*	X	
Prairie Falcon	*Falco mexicanus*	X	
Swainson's Hawk	*Buteo swainsonii*	X	
Ferruginous Hawk	*Buteo regalis*	X	X
Northern Harrier	*Circus cyaneus*	X	
Burrowing Owl	*Anthene cunicularium*	X	
Flammulated Owl	*Otus flammeolus*	X	
Short-eared Owl	*Asio flammeus*	X	
Loggerhead Shrike	*Lanius ludovicianus*	X	
Pinyon Jay	*Gymnorhinus cyancephalus*	X	
Greater Sage-grouse	*Centrocercus urophasianus*	X	X
Gambel's Quail	*Callipepla gambelii*		X
Lewis's Woodpecker	*Melanerpes lewis*	X	X
Williamson's Sapsucker	*Sphyrapicus thyroideus*	X	
American Three-toed Woodpecker	*Picoides dorsalis*		X
Virginia's Warbler	*Vermivora virginiae*	X	X
Grace's Warbler	*Dendroica graciae*	X	
Black-throated Gray Warbler	*Dendroica nigrescens*	X	X
Black Rosy-finch	*Leucosticte atrata*		X
Gray Vireo	*Vireo vicinior*	X	X
Sage Sparrow	*Amphispiza belli nevadensis*	X	X
Brewer's Sparrow	*Spizella breweri*	X	X

Notes:
1—Based on bird lists for Bird Conservation Regions 16 (Colorado Plateau) and 9 (Great Basin), which cover the RFO area.
2—The PIF list of 24 priority species for conservation actions can be found in the document entitled *Coordinated Implementation Plan for Bird Conservation in Utah*, prepared by Utah Steering Committee, Intermountain West Joint Venture, 2005 (http://iwjv.org/Images/UTPlan2005.pdf).

3.3.9.5 Raptors

Raptor management on public lands in Utah is guided by the use of best management practices (BMP) (Appendix 10), which are BLM-specific recommendations for implementation of the USFWS, Utah Field Office's *Guidelines for Raptor Protection from Human and Land Use Disturbances*. The guidelines were originally developed by USFWS in 1999 and were updated during 2002 to reflect changes brought about by court decisions, policy changes, and new EOs. The guidelines were provided in an attempt to ensure project compatibility with the biological requirements of raptors and to encourage an ecosystem approach to raptor management.

Raptors have very specific requirements for nesting territories, including vegetation structure and diversity. Requirements for physiographic features (e.g., elevation, slope), as well as prey availability, vary by species. Raptors typically reuse the same nesting territory for years, and alterations to these areas could reduce the viability of raptor populations. Threats to raptors include loss of habitat, reduction in

food supply, and disturbance during nesting. Habitat loss from changing land use to industrial, agricultural, or recreational could reduce available food supply or alter nesting territories. Each raptor nest, its offspring, and supporting habitat are considered important to the long-term viability of raptor populations. Changes in vegetation structure and diversity could reduce the areas meeting nest site requirements.

Generally, courtship, nest construction, incubation, and early brooding are considered higher risk periods during which adults are easily prone to temporarily or permanently abandoning nests in response to disturbance. This may result in abandonment of eggs or young. Loss or alteration of habitat for any raptor species can also result in a loss of or change in the raptor prey base or historical nesting territories (USFWS 2002e).

3.3.10 Wild Horses and Burros

The goal of the Wild and Free-Roaming Horse and Burro Act is to manage wild horses and burros, "in the area where presently [1971] found as an integral part of the natural system of the public lands." The Act and subsequent regulations direct that wild horses and burros be managed to ensure a thriving natural ecological balance with the minimum feasible management required to maintain the populations. The management of wild horse and burro populations to maintain a sufficient size to be genetically viable is an important aspect of this goal. Some management decisions could affect the viability of wild horse or burro populations. Long-term intensive management actions on burro populations, that fail to meet the minimum feasible management regulations, would be noted as an impact. Following passage of the Wild, Free-Roaming Horse and Burro Act of 1971, BLM identified 2 wild horse and burro management areas in the planning area: the Robbers Roost Herd Management Area (HMA) for wild horses and the Canyonlands HMA for wild burros.

3.3.10.1 Robbers Roost Herd Management Area

The Robbers Roost HMA straddles the Wayne-Emery County line. Vegetation in the area is largely desert grassland, with desert shrub interspersed throughout. As is common throughout the area, the lack of water limits the habitat available for horses. Management intervention is required to maintain a viable population level of 15 to 25 horses. In 2003, it was estimated that there were about 17 horses in the HMA.

A 1975 agreement between the Moab and Richfield district managers directed the Moab District to administer the Robbers Roost HMA. This agreement was updated in 1995, again directing that the Moab District, now part of the Price Field Office (FO), manage the wild horses within the HMA. Thus, the management of and planning for the Robbers Roost HMA is the responsibility of the Price FO and is consequently not addressed in this PRMP/FEIS.

3.3.10.2 Canyonlands Herd Management Area

The Canyonlands HMA is more than 89,000 acres, including several State of Utah parcels. It is located in eastern Wayne County, adjacent to Glen Canyon National Recreation Area on the east and the Horseshoe Canyon unit of Canyonlands National Park on the west. The HMA overlaps portions of the French Spring/Happy Canyon WSA, Horseshoe Canyon South WSA, Horseshoe Canyon North WSA, and Dirty Devil WSA. Vegetation in the area is a mix of desert grasses and desert shrub, although areas with deeper soils support sagebrush and juniper.

Existing planning allocates forage for fewer than 20 burros. However, a recent grazing use adjustment on a portion of a grazing permit and preference has resulted in additional forage for burros and has eliminated most competition with livestock for habitat resources, such as forage and water on the HMA. Throughout the area, the lack of water resources limits the habitat available for burros. Current herd management includes regular inventories to monitor burro numbers. Data gathering in the Canyonlands wild burro herd has historically been aerial and on-the-ground. The most recent inventory of the Canyonlands HMA identified nearly 60 burros. An appropriate management level of 60 to 100 burros is required to maintain a viable herd unit. The isolated and remote location of this burro HMA makes extensive management intervention and monitoring difficult.

The burros of the Canyonlands HMA are unique in that pinto coloration, usually rare in wild burros, predominates. The remote nature of the Canyonlands HMA, coupled with the rough terrain, limit opportunities for the public to view these unique animals.

3.3.11 Fire and Fuels Management

Fire is a natural phenomenon. Vegetation communities in the planning area have adapted to the presence or absence of wildland fire over several thousand years. Geographic, topographic, elevational, and climatic variances throughout the planning area have resulted in an array of conditions in which fire has historically (from 200 to 400 years ago) affected vegetation differently. Consequently, forests, woodlands, and rangelands throughout the planning area have adapted to fire. In addition to natural fire regimes, many vegetation communities were affected by Native American use of fire to manipulate the environment (Williams 2003). Therefore, the role of anthropogenic (human-caused) fires cannot be separated from the role of natural fires for at least the last 10,000 years.

Research has shown that many of the forest, woodland, and rangeland ecosystems in the planning area are not functioning properly. Vegetation communities are considered as functioning properly when they can withstand and/or recover from fire naturally. Appendix 6 provides detailed information concerning the fire ecology of each major vegetation cover type potentially affected by the decisions made in this Proposed RMP/Final EIS. The historic fire-return intervals are identified, as are the responses to fire disturbance of each cover type. Appendix 6 also includes information about the general condition cover type and departure from historic conditions.

3.3.11.1 Wildland Fire Occurrence

Studies of fire-scarred trees in the Henry Mountains and national forest lands within the planning area indicate that before European settlement, fires burned the areas in a relatively consistent pattern. Tree rings from ponderosa pines in a predominantly Douglas-fir stand indicated that the area burned an average of every 19 years (Bartos and Campbell 1998). Note that this does not indicate that the entire planning area burned this regularly. However, areas of similar vegetation types would have been adapted to similar fire intervals.

Yearly wildfire occurrence data for the RFO is available from 1979 to 2003. (Note: Earlier data is for the old Richfield District, which encompassed what is now both the Richfield and Fillmore FOs.) Figure 3-16 lists the yearly number of wildfires and acres burned over this time. As displayed in Figure 3-17, most wildfires (81 percent) in the RFO occur from June through August. Figure 3-18 displays the size distribution of the 300 wildfires since 1979.

Figure 3-19 illustrates the distribution of the 300 wildfires by cause. Approximately 76 percent of the wildfires in the RFO were ignited by lightning.

Figure 3-16. Richfield Planning Area Wildfires and Acreages (1979–2003)

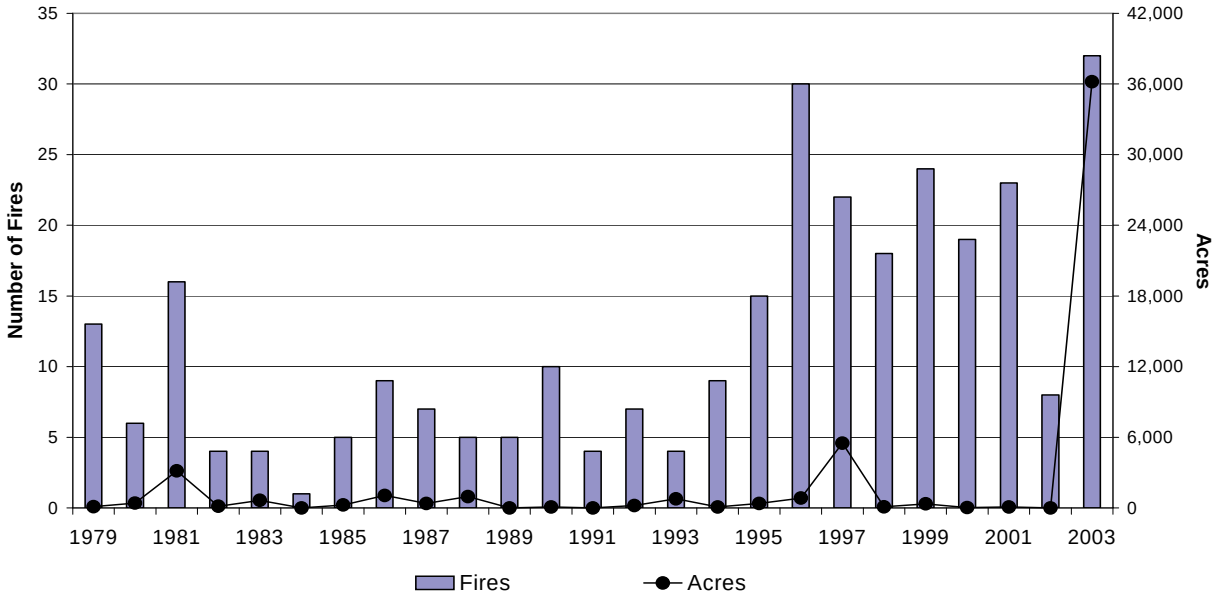

Figure 3-17. Richfield Field Office Wildfire Occurrence by Month (1979–2003)

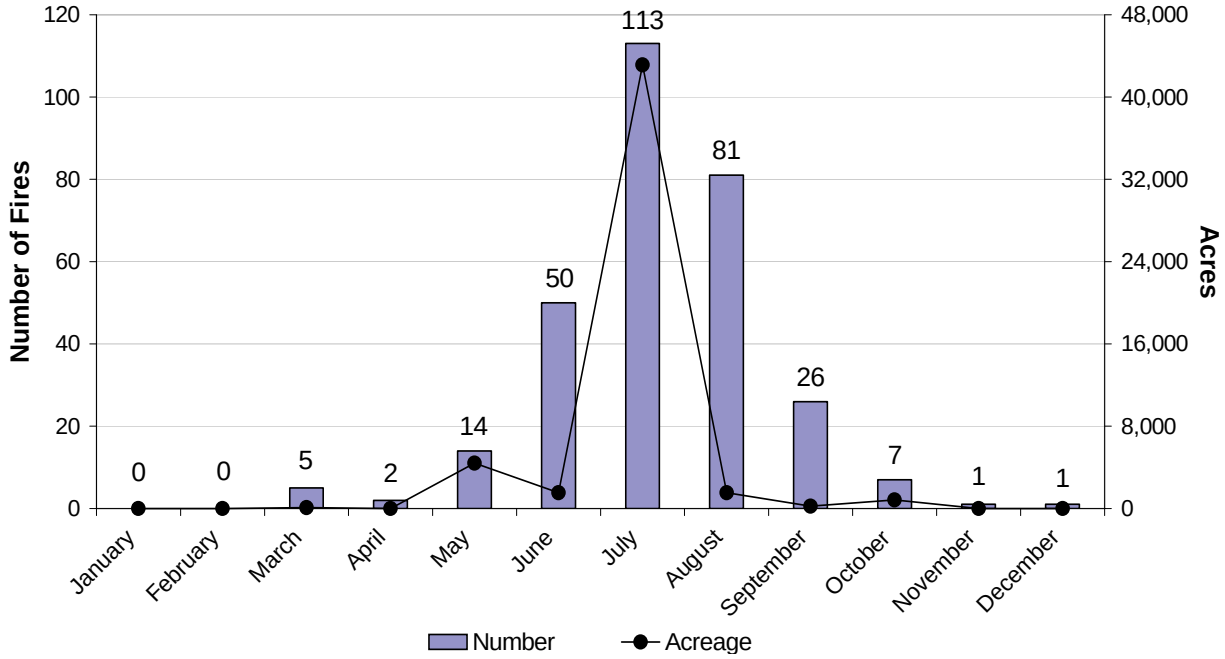

Figure 3-18. Richfield Field Office Wildfires by Size (1979–2003)

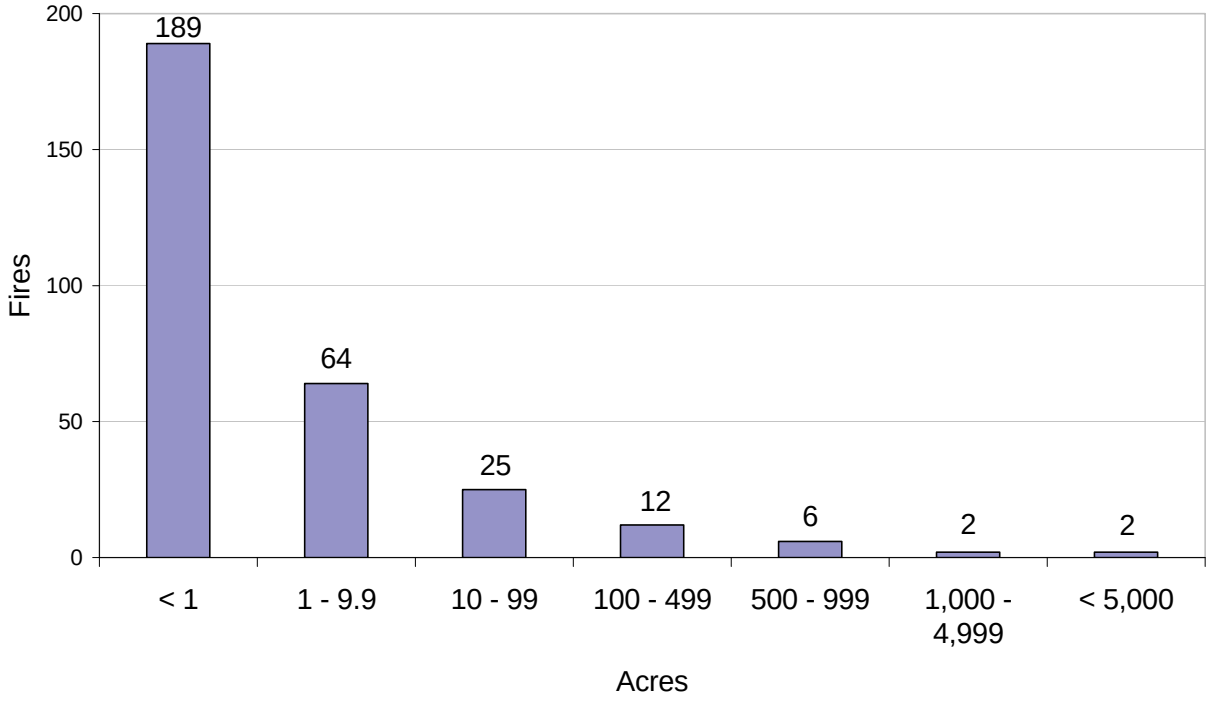

Figure 3-19. Richfield Field Office Wildfire Causes (1979–2003)

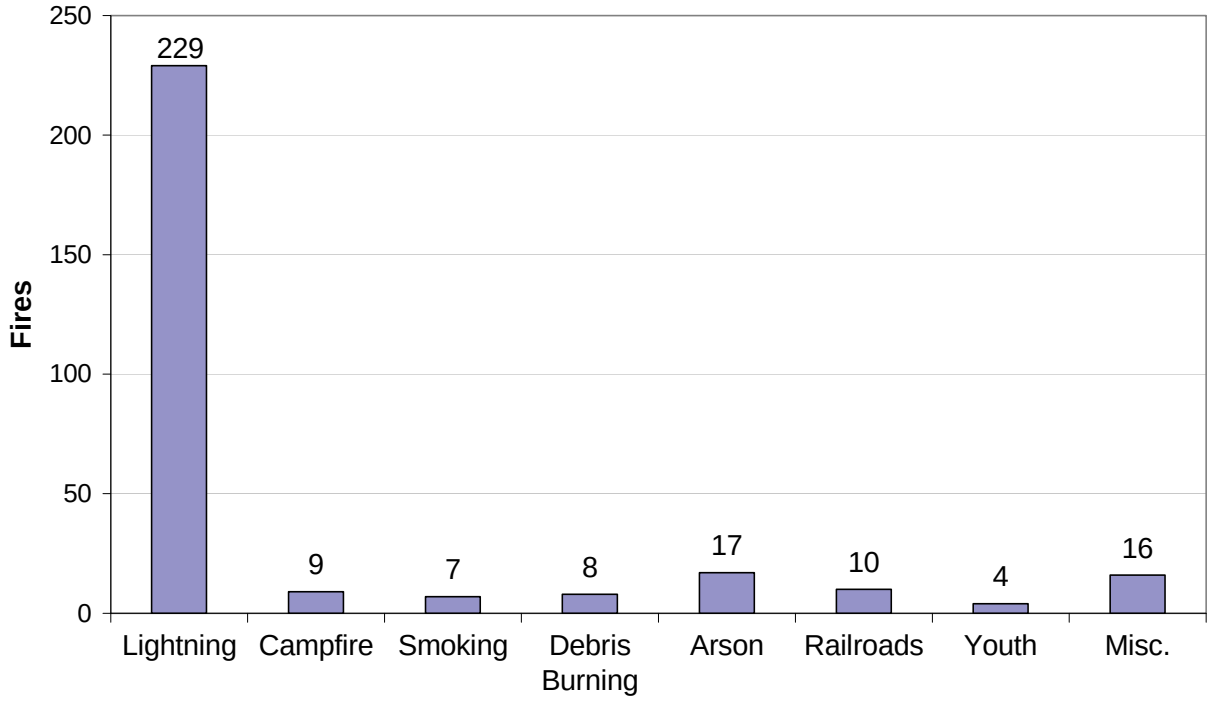

3.3.11.2 Hazardous Fuels Reductions

Many areas in the lands managed by the RFO have changed from historic disturbance regimes. Aspen forest types, which reproduce through suckering rootstock, need disturbance or dieback to stimulate regeneration (O'Brien and Waters 1998). In the absence of disturbance, areas once dominated by aspen have been supplanted by conifers or sagebrush (Bartos and Campbell 1998). Areas with small amounts of aspen in a stand may indicate that the area was once dominated by aspen (Bartos and Campbell 1998). "An approximately 60% decline in aspen dominated landscapes has occurred on National Forest System lands across Utah" (Bartos and Campbell 1998, pp. 23). Aspen in the planning area, either adjacent to USFS land or in the Henry Mountains, is intermingled with and adjacent to stands of mixed conifer. Conditions noted throughout Utah are not expected to be different from those in the planning area.

The exclusion of frequent, low-intensity fires in ponderosa pine stands has resulted in a buildup of understory fuels in these stands. This change threatens the pine stands, which are resistant to low-intensity fire but susceptible to larger crown fires. Understory fuels act as ladders, allowing fire to jump to the trees' crown, burning ponderosa pine stands.

Using Forest Inventory and Analysis data collected on public lands administered by the RFO, the Rocky Mountain Research Station found that more than 67 percent of plots had a stand age of less than 150 years. These stands form a closed-canopy "belt" between lower valley shrub lands and higher mountain forests. Reduction of fine fuels and decreases in fire return intervals have encouraged pinyon-juniper encroachment, leading to large acreages of closed canopy pinyon-juniper in formerly treeless areas (USFS 2000). As a result, structural stages are strongly weighted to stands much denser than typical conditions.

Stands are considered as functioning properly when they can withstand and/or recover from disturbance. Many vegetation communities, specifically those described above, are not considered in PFC. For further discussion on fire ecology of the various vegetation types, refer to Appendix 6. Table 3-18 identifies existing vegetation acreages and their estimated departure from historic (200–400 years before the present) acreages. It is estimated that Native American -initiated fires composed approximately 40 percent of historic fires (Williams 2003). Therefore, allowing wildland fires at natural levels would not include the Native American –initialed fires.

The increasing size, intensity, and severity of wildfires pose greater threats to human life and property. More people are recreating on and adjacent to public lands and building homes in wildland areas, increasing their exposure to naturally ignited wildland fires and increasing the risk of human-caused wildfires. Additionally, the threat to other resource values from uncharacteristically intense and severe wildfires has increased, resulting from uncharacteristic changes in vegetation, fuel loadings, and fire behavior. Consequently, fire suppression costs have also increased.

Table 3-18. Vegetation Departure from Historic Acreages

Class Name	Historic Acreages	Percentage of Total	Existing Acreages	Percentage of Total
Other Non-Vegetation	67,858	3.2%	67,858	3.2%
Spruce-Fir[3]	17,022	0.8%	29,317	1.4%
Aspen	20,251[1]	1.0%	5,786	0.3%
Ponderosa Pine	44,463	2.1%	42,785	2.0%
Oak	26,330	1.2%	19,629	0.9%
Mountain Shrub	24,781	1.2%	16,378	0.8%

Class Name	Historic Acreages	Percentage of Total	Existing Acreages	Percentage of Total
Pinyon-Juniper	216,036[2]	10.2%	551,674	25.9%
Sagebrush Steppe	660,468	31.0%	343,781	16.2%
Desert Grassland	324,652	15.3%	324,652	15.3%
Desert Brush	726,085	34.1%	726,085	34.1%
Total	**2,127,946**		**2,127,945**	

Notes—
1—Desired aspen figure created by dividing existing acreage by 0.4, basing this figure on Campbell and Bartos (1998) conclusion that aspen in Utah has undergone a 60% reduction in coverage.
2—Forest Inventory and Analysis data collected and determined from public lands within the planning area indicates that approximately 67.6% of the pinyon-juniper woodland type in the RFO is 150 years old or younger. It is assumed that 90% of that 67.6% is not in PFC and requires treatment within the next 100 years. The trees older than 150 years and 10% of those younger than 150 years, are assumed to be stable stands that are not adapted to the 10–30 year fire interval (e.g., those located on dry, rocky ridges, very xeric soils).
3—The highest elevations of the spruce/fir type have very long fire return intervals, and these ecosystems have not been adversely affected by fire exclusion.

3.3.11.3 Fuels Treatments

Over the last 20 years, the construction of homes and businesses in the wildland-urban interface (WUI) has compounded the problem of fuels accumulation. The resulting risk of exposure to high-intensity fires that could threaten safety and property has increased. Declining vegetation conditions and increased construction have required a more active hazardous fuel treatment program to reduce the number and severity of wildfires.

Before implementation of the 1995 Federal Wildland Fire Management Policy, fewer than 1,000 acres of vegetation per year were treated in the RFO. This acreage included prescribed fire and other means of treating fuels. Since 1995, hazardous fuel reduction efforts within the RFO have treated roughly 4,000 acres per year. The focus of most of these treatments has been on reducing hazardous fuels in WUI areas, although treatments were also implemented to improve ecosystem health, improve rangeland production, and enhance wildlife habitat.

3.3.11.4 Fire Regimes and Condition Classes

Fire regimes address the nature of disturbance by fire by describing its historic intensity, frequency, and effect on vegetation. Knowledge of fire regimes is a critical component in managing landscapes and analyzing changes in fire frequencies and intensities. Table 3-19 lists the natural fire regimes by which vegetation is classified in the RFO. Categorization of vegetation types by fire regimes was based on information that is provided in Appendix 6.

Table 3-19. Fire Regime Classifications and RFO Estimated Acreage

Regime	Fire Frequency	Fire Intensity	Estimated Acres in RFO	Percentage of Total
Fire Regime I	0–35 years	Low Severity	43,600	2.1%
Fire Regime II	0–35 years	Stand Replacing	903,000	44.0%
Fire Regime III	35–100 years	Mixed Severity	34,700	1.7%

Regime	Fire Frequency	Fire Intensity	Estimated Acres in RFO	Percentage of Total
Fire Regime IV	35–100 years	Stand Replacing	1,070,600	52.2%
Fire Regime V	More than 200 years	Stand Replacing or Mixed Severity	300	<0.1%

Source: U.S.C. 2003; USFS 2001; USGS 2004.

As they relate to fire, vegetation conditions are evaluated by the degree of departure from fire regimes that a specific vegetation community demonstrates. Departure from fire regimes is indicated by changes to key ecosystem components (e.g., species composition, structural stage, stand age, canopy closure, and fuel loadings). The degree of departure is ranked using 3 condition classes that categorize vegetation communities by evaluating the difference between their historic fire regime and related indicating characteristics, and their current condition and its indicating characteristics. Simply put, fire regime "condition classes are a qualitative measure describing the degree of departure from historical fire regimes" (Schmidt K.M. *et al.* 2002). Table 3-20 shows the estimated acreage of vegetation in the RFO in each condition class.

Table 3-20. Fire Regime Condition Class Description and RFO Estimated Acreage

Condition Class	Description	Estimated Acres in RFO	Percentage of Total
1	Fire regimes are within a historical range, and the risk of losing key ecosystem components is low. Vegetation attributes (species composition and structure) are intact and functioning within a historical range.	2,300	<1%
2	Fire regimes have been moderately altered from their historical ranges. The risk of losing key ecosystem components from fire is moderate. Fire frequencies have departed from historical frequencies by one or more return intervals (either increased or decreased), resulting in moderate changes to the size, intensity, or severity of fires or to landscape patterns. Vegetation attributes have been moderately altered from their historical range of attributes.	281,000	14%
3	Fire regimes have been significantly altered from their historical ranges. The risk of losing key ecosystem components from fire is high. Fire frequencies have departed from historical frequencies by multiple return intervals, resulting in dramatic changes to the size, frequency, intensity, or severity of fires or landscape patterns. Vegetation attributes have been significantly altered from their historical range of attributes.	1,768,900	86%

Sources: Schmidt K.M. *et al.* 2002; U.S.C. 2003; USGS 2004.

Areas in Condition Classes 2 and 3 are of most concern because they often need management intervention before allowing fire to return naturally. Acreage of vegetation in Condition Class 3 is high because much of the RFO has converted to pinyon-juniper and sagebrush vegetation types.

3.3.12 Non-WSA Lands with Wilderness Characteristics

Since WSAs were established in the 1980s, designation of wilderness in Utah has become a prominent state and national issue. For more than 20 years, the public has debated which lands have wilderness characteristics and should be considered by Congress for wilderness designation. As a result of the debate (and a significant passage of time since BLM's original inventories), in 1996 the Secretary of the Interior directed the BLM to take another look at some of the lands in question. In response to this direction, the BLM inventoried these lands and found approximately 2.6 million acres of public land statewide (outside of existing WSAs) to have wilderness characteristics (BLM 1999).

In September 2005, the BLM and the State of Utah, the Utah School and Institutional Trust Land Administration (SITLA), and the Utah Association of Counties (collectively "Utah") reached an agreement negotiated to settle a lawsuit originally brought in 1996 by the State of Utah, which challenged the BLM's authority to conduct new wilderness inventories. The settlement stipulated that the BLM's authority to designate new WSAs expired no later than October 21, 1993. Pursuant to the Federal Land Policy and Management Act of 1976 (FLPMA), 43 U.S.C. § 1712(c), the BLM, however, does have the authority to conduct inventories for characteristics associated with the concept of wilderness and to consider management of these values in its land use planning process. The BLM's *Land Use Planning Handbook* (H-1601-1) states that decisions on whether or not to protect wilderness characteristics are to be considered during planning. This section addresses lands outside existing WSAs that have been identified as having wilderness characteristics.

Non-WSA lands with wilderness characteristics are those that have the appearance of naturalness and outstanding opportunities for solitude or primitive and unconfined recreation, and also comprise an area of 5,000 acres, or areas less than 5,000 acres that are contiguous to designated wilderness, WSAs, or other administratively endorsed for wilderness management lands, or, in accordance with the Wilderness Act's language, areas "of sufficient size as to make practicable its preservation and use in an unimpaired condition." BLM used the same criteria for determining wilderness characteristics as in the 1979 wilderness inventory. The 5,000-acre value was helpful to BLM in making preliminary judgments, but it was not considered a limiting factor. The size criterion of 5,000 acres was applied only to standalone units, that is, units not contiguous with other federal lands previously determined to possess wilderness characteristics (e.g., WSAs and NPS and USFS lands that are administratively endorsed for wilderness). Units contiguous with federal lands with wilderness characteristics were evaluated for all wilderness characteristics found in the inventoried area. Opportunities for solitude and primitive recreation were assumed present in association with the larger contiguous area.

Detailed information about non-WSA lands with wilderness characteristics is part of the administrative record for this Proposed RMP/Final EIS. The following records are available for public review at the RFO: 1) 1999 Utah Wilderness Inventory; 2) 1999 Utah Wilderness Inventory Revision Document for the Richfield Field Office (December 2002); 3) 1999 Utah Wilderness Case Files for the RFO; 4) Reasonable Probability Determinations for the RFO; and 5) Documentation of Wilderness Characteristics Review for the RFO.

Non-WSA lands with wilderness characteristics that were inventoried by BLM in the 1999 Utah Wilderness Inventory included approximately 511,200 acres in 20 wilderness inventory areas (WIA). On the basis of subsequent public comments and after conducting additional field checks, the BLM revised the inventory in December 2002. The revised inventory identified a total of 551,770 acres in 20 WIAs within the RFO possessing wilderness characteristics. The inventory and the inventory revision also identified areas in portions of WIAs that did not have wilderness characteristics.

In addition to the lands that were inventoried in the 1999 Utah Wilderness Inventory and its revision, additional lands in the RFO have been reviewed for wilderness characteristics by BLM. These lands are currently proposed for wilderness as part of S.1179, America's Red Rock Wilderness Act of 2007, and are neither WSAs nor WIAs. (Note: The Act has been introduced in Congressional Term 110 as S.1170). The wilderness characteristics review process involved a BLM interdisciplinary team that reviewed available information and followed up with field trips where necessary. The BLM interdisciplinary team evaluated information provided by the public about these areas, their on-the-ground knowledge of these areas, information in case files and field files, master title plats, aerial photos, GIS data layers, and field inspections, and determined that all or parts of these areas have wilderness characteristics. When the initial review process was completed, the interdisciplinary team reviewed about another 200,000 acres, of which 130,830 acres were found to have wilderness characteristics.

In summary, since the beginning of the 1999 Utah wilderness inventory process, the BLM has evaluated 31 areas totaling 848,500 acres for their wilderness characteristics in the RFO. Of these, the BLM determined that 29 areas totaling 682,600 acres met the criteria for wilderness characteristics of size, naturalness, and outstanding opportunities for solitude or primitive recreation (Table 3-21 and Map 3-9). These lands, non-WSA lands with wilderness characteristics, have been carried through this land use planning process to determine how their wilderness characteristics will be managed. Of the 38 total areas evaluated in table 3-21, 9 of the inventoried areas were found to lack wilderness characteristics, and are also summarized in the table. During the comment period for the DRMP/DEIS, 7 new submittals were received and evaluated for their wilderness characteristics. None of these areas were found to possess wilderness characteristics. The Proposed RMP/Final EIS includes management prescriptions for 12 of the 29 areas totaling 78,600 acres.

Wilderness characteristic areas generally fall into one (or 2) of 3 broad categories:

- Areas contiguous to BLM WSAs
- Areas adjacent to NPS lands administratively endorsed for wilderness designation
- Areas (generally over 5,000 acres) that stand alone as separate units.

Table 3-21. Non-WSA Lands With Wilderness Characteristics Evaluation

#	Area Evaluated	County	Acres Evaluated	Acres Found to Possess Wilderness Characteristics	Comments
1	Bull Mountain	Garfield	4,800	3,800	Contiguous to Bull Mountain WSA.
2	Bullfrog Creek	Garfield	42,600	33,700	
3	Cane Spring Desert	Garfield	18,300	0	
4	Dirty Devil/ French Spring	Garfield Wayne	149,500	133,100	Contiguous to Dirty Devil and French Spring WSAs. Includes Dirty Devil eligible wild and scenic river (WSR) segment.
5	Dogwater Creek	Garfield	3,500	3,500	Contiguous to Capitol Reef National Park lands that are administratively endorsed for wilderness designation.
6	Fiddler Butte	Garfield	22,000	19,700	Contiguous to Fiddler Butte WSA.
7	Flat Tops	Wayne	23,000	23,000	Adjacent to non-WSA lands with wilderness characteristics in the Price FO (Emery County)

#	Area Evaluated	County	Acres Evaluated	Acres Found to Possess Wilderness Characteristics	Comments
8	Fremont Gorge	Wayne	20,100	16,000	Contiguous to Fremont Gorge WSA and Capitol Reef National Park lands that are administratively endorsed for wilderness designation. Includes Fremont Gorge eligible WSR segment
9	Horseshoe Canyon South	Wayne	20,600	20,600	Contiguous to Horseshoe Canyon South WSA, Canyonlands National Park (Horseshoe Canyon Unit) and Glen Canyon National Recreation Area (NRA) lands that are administratively endorsed for wilderness designation
10	Jones Bench	Sevier	3,300	3,300	Contiguous to Capitol Reef National Park lands that are administratively endorsed for wilderness designation
11	Kingston Ridge	Piute	10,200	10,200	
12	Labyrinth Canyon	Wayne	27,100	12,300	Adjoins Horseshoe Canyon North WSA, Canyonlands National Park (Horseshoe Canyon Unit) and Glen Canyon NRA lands that are administratively endorsed for wilderness designation
13	Limestone Cliffs	Sevier	24,900	24,800	Adjacent to non-WSA lands with wilderness characteristics in the Price Field Office (Emery County)
14	Little Rockies	Garfield	23,300	23,200	Within Little Rockies National Natural Landmark, contiguous to Little Rockies WSA and Glen Canyon NRA lands that are administratively endorsed for wilderness designation
15	Long Canyon	Garfield	16,600	16,600	Contiguous to Capitol Reef National Park lands that are administratively endorsed for wilderness designation
16	Mount Ellen—Blue Hills	Garfield Wayne	66,900	49,800	Contiguous to Mount Ellen/Blue Hills WSA
17	Mount Hillers	Garfield	2,300	1,800	Contiguous to Mount Hillers WSA.
18	Mount Pennell	Garfield	77,000	65,600	Contiguous to Mount Pennell WSA
19	Muddy Creek/Crack Canyon	Wayne	65,600	61,800	Adjacent to non-WSA lands with wilderness characteristics in the Price Field Office (Emery County)
20	Mussentuchit Badlands	Sevier	700	700	Adjacent to non-WSA lands with wilderness characteristics in the Price FO (Emery County)
21	Notom Bench	Wayne	8,700	8,000	Contiguous to Capitol Reef National Park lands that are administratively endorsed for wilderness designation
22	Phonolite Hill	Piute	7,900	7,900	

#	Area Evaluated	County	Acres Evaluated	Acres Found to Possess Wilderness Characteristics	Comments
23	Pole Canyon/Hunter Spring	Garfield	6,000	6,000	
24	Ragged Mountain	Garfield	30,100	25,900	
25	Red Desert	Wayne	40,900	40,700	Contiguous to Capitol Reef National Park lands that are administratively endorsed for wilderness designation
26	Robbers Roost Flats	Wayne	7,700	0	
27	Rock Canyon	Sevier	1,300	1,300	Adjacent to non-WSA lands with wilderness characteristics in the Price FO (Emery County)
28	Rocky Ford	Piute	6,700	6,700	
29	Sweetwater Reef	Wayne	6,200	6,200	Adjacent to non-WSA lands with wilderness characteristics in the Price FO (Emery County)
30	Wild Horse Mesa	Wayne	88,300	49,700	Adjacent to non-WSA lands with wilderness characteristics in the Price Field Office (Emery County)
31	Wildcat Knolls	Sevier	22,400	6,700	Adjacent to non-WSA lands with wilderness characteristics in the Price FO (Emery County)
32	Aquarius Plateau	Garfield and Wayne	16,500	0	
33	North Sevier Plateau	Piute and Sevier	35,900	0	
34	Pahvant Range	Sevier	3,800	0	
35	South Sevier Plateau	Piute	17,100	0	
36	Thousand Lakes	Wayne	3,000	0	
37	Tushar Mountains	Piute and Sevier	4,300	0	
38	Wasatch Plateau	Sevier	1,100	0	
	Total		**930,200**	**682,600**	

3.4 RESOURCE USES

3.4.1 Forestry and Woodland Products

3.4.1.1 Forest and Woodland Types and Products

Forested and woodland areas within the RFO range from oak and pinyon-juniper stands to aspen, ponderosa pine, Douglas fir, white fir, Englemann spruce, and limber pine. Generally, lower elevations (6,000 feet to 8,400 feet) are dominated by woodland species, such as juniper. Middle elevations (7,000 feet to 7,500 feet) are a mix of pinyon-juniper, whereas in higher elevations (7,500 feet to 8,000 feet) pinyon and oak brush dominate with the occasional juniper. Pinyon-juniper stands compose the largest forest cover type within the RFO (see Section 3.3.4, Vegetation).

As elevation increases, timber species dominate the cover type. Between 8,000 feet and 9,600 feet, ponderosa pine and aspen are the major species, whereas Douglas fir, white fir, subalpine fir, Engelmann spruce, aspen, and limber pine are found at elevations above 9,600 feet. Generally, timber species are located on north- and northwest-facing slopes or in canyon bottoms where there is enough soil moisture to sustain timber. The largest concentrations of timber cover types are found in the Henry Mountains and along the border between BLM and USFS-administered lands (Map 3-3).

Pinyon-juniper woodlands cover 552,000 acres, about one-quarter of the RFO. In contrast, true forests—including ponderosa pine, mixed-conifer, and aspen—represent only 5 percent of the RFO and are located primarily in the Henry Mountains. Forests and woodlands within the RFO are of limited commercial value because of their low productivity and distance from markets. By and large, the aesthetic and ecological importance of forests far outweighs their limited economic value.

Pinyon-Juniper Woodlands

Pinyon-juniper woodlands are increasing in size and density over a large portion of the RFO. This increase is attributed to the absence of wildland fire for the last century and long-term pinyon-juniper management. Where pinyon-juniper canopy cover is dense with large trees, very few, if any, desirable forage species are present. Plant species diversity is decreasing because of the increasing tree canopy cover.

The boundaries of the pinyon-juniper woodlands are also increasing. Pinyon-juniper woodlands are invading sagebrush areas and are outcompeting desirable forage species. Shrubs and herbaceous plants reduce erosion better than pinyon-juniper trees. Increasing pinyon-juniper density adversely affects watershed health. Areas with steep slopes and erodible soils in pinyon-juniper tree cover are vulnerable to serious soil erosion. Pinyon-juniper woodlands do not burn in normal precipitation years but during years of drought, the buildup of continuous fuels is a fire hazard. Because these woodlands have expanded into areas formerly occupied by other vegetation types, management attention has focused on reducing, rather than the sustaining them.

Pinyon pine provides utilitarian value in the form of firewood, Christmas trees, and pine nuts. Juniper is used for fence posts and firewood. Both are unsuitable for lumber because of their small size, irregular shape, and lack of self-pruning lower limbs. Approximately 600 cords of firewood (both commercial and non-commercial) and 150 Christmas trees are harvested from the RFO per year.

Ponderosa Pine

Ponderosa pine forests cover 43,000 acres, or about 2 percent of the RFO. In the inland west and southwest, ponderosa pine is a commercially valuable and productive timber tree. Currently, this species is less important economically in the planning area, but there have been limited sales of ponderosa pine in the past. Permits for ponderosa pine harvesting are limited to a few trees each and occur primarily for fire salvaged trees. Requests are evaluated on a case-by-case basis.

Mixed-Conifer

Less than 2 percent of the RFO (29,000 acres) is forested by mixed-conifer stands, which include Engelmann spruce, white fir, subalpine fir, Douglas fir, and several pine species. Although commercially important elsewhere, these forests are of limited economic value within the RFO. Requests for harvesting of mixed conifer species are evaluated on a case-by-case basis, and there have been no known recent sales.

Aspen

Quaking aspen forests cover 12,000 acres, less than 1 percent of the RFO. Because it is easy to cut, aspen is sometimes used for firewood. It has no commercial value within the RFO. No recent permits have been issued for aspen. Requests are evaluated on a case-by-case basis.

3.4.1.2 Current Level of Forest and Woodland Activity

In 2001, RFO and Henry Mountain Field Station issued 647 permits for forest products; 268 of these permits were for collecting seeds from wildland sources. In 2002, the 2 offices issued 456 permits for forest products, with 109 of them for collecting seeds from wildland sources. Because of the serious drought and the decrease in seed production in 2002, the RFO did not issue as many seed permits in 2002, and did not issue any seed permits at all in the fall/winter of 2002–2003.

3.4.1.3 Forest and Woodland Health

The RFO has many areas of diseased or insect killed trees in the pinyon-juniper woodlands. This is generally limited to single trees, but some small patches, usually less than an acre, are scattered throughout the area. During the prolonged drought of the late 1990s and early 2000s, areas of pinyon-juniper woodlands died. Forests in the Henry Mountains also suffered from disease and insect infestations. In 2003, a large number of pinyon and juniper trees died on the north end of the Henry Mountains and in other areas. Portions of Mount Ellen, Mount Pennell, and Mount Hillers burned during 2003.

In 2001 and 2002, in accordance with the National Fire Plan, the RFO and the Interagency Fire Management organization began a cooperative effort to reduce fuels and restore forest and woodland health on a much larger scale. In 2002, mechanical methods were used to reduce fuels and restore woodland health on 4,061 acres within the RFO.

3.4.2 Livestock Grazing

Passage of the Taylor Grazing Act in 1934 initiated the federal effort to regulate livestock grazing on public lands to provide for the orderly use, improvement, and development of the range. The act established a system for allotting grazing privileges to livestock operators based on grazing capacities and priorities of use, and to delineate allotment boundaries. It also established standards for rangeland improvements and implemented grazing fees. The act placed 142 million acres of land in western states under the jurisdiction of the Grazing Service, which evolved into the BLM in 1946. FLPMA and the Public Rangelands Improvement Act (PRIA) of 1978 provide additional authority for the management of livestock grazing on public land.

3.4.2.1 Grazing Authorization

Within the RFO, the BLM manages livestock grazing on public lands in Sanpete, Sevier, Wayne, and Piute counties; portions of Garfield County; and some allotments within Glen Canyon NRA and Capitol Reef National Park. Livestock grazing on public land is administered through livestock grazing allotments, shown on Map 2-7. Through an inter-district agreement, the Price FO manages several allotments within the RFO, and the RFO manages several allotments within the Price FO. In 2002, 194 allotments in the RFO were used by 143 livestock operators. The total forage available for livestock use in the RFO is 109,951 animal unit months (AUM). The total AUMs authorized for the past 15 years are shown in Table 3-22. Grazing permits are usually issued for 10 years. Active use varies from the permitted use shown in the table as a result of fluctuations in forage availability and decisions of livestock operators to use or not use the public range in a given year. Appendix 7 (Table A7-1) provides detailed information on existing grazing allotments in the RFO.

Table 3-22. Comparison of Total Permitted Use to Active Use

Year	Active Use			Permitted Use
	Cattle	Sheep	Total	
1988	40,467	9,426	49,893	109,951
1989	35,337	8,282	43,619	109,951
1990	30,202	7,793	37,995	109,951
1991	35,837	6,423	42,260	109,951
1992	39,783	7,478	47,261	109,951
1993	42,768	9,393	52,161	109,951
1994	43,338	8,913	52,251	109,951
1995	47,532	11,514	59,046	109,951
1996	48,996	8,788	57,784	109,951
1997	48,894	10,051	58,945	109,951
1998	59,930	9,664	69,594	109,951
1999	62,295	10,062	72,357	109,951
2000	50,246	9,160	59,406	109,951
2001	63,743	12,848	76,591	109,951
2002	52,287	7,647	59,934	109,951
2003	31,011	8,910	39,921	109,951

Year	Active Use			Permitted Use
	Cattle	Sheep	Total	
Average	45,792	9,147	54,939	109,951

3.4.2.2 Allotment Categorization and Management

Allotments in the RFO are divided into 3 selective management categories. These categories were developed in 1981 to prioritize grazing allotments to achieve cost-effective improvement of rangeland condition and production. This selective management process emphasized those allotments with the most need and the best potential for return on the investment of public funds. Most allotments have been placed into one of the 3 categories according to management needs, resource conflicts, potential for improvement, and funding and/or staffing constraints. The 3 management categories are: Improve, Maintain, and Custodial.

Improve category allotments are managed to improve current resource conditions on allotments with resource issues and which have a high potential for return on investment. They receive the highest priority for funding and management actions. Maintain category allotments are managed to maintain current satisfactory resource conditions. They are actively managed to ensure that resource values do not decline. Custodial category allotments are under custodial management by the BLM to protect resource conditions and values. As watersheds are evaluated, the allotment category is reviewed. The RFO has 91 Improve category allotments covering 1,657,475 acres, 25 Maintain category allotments covering 589,884 acres, and 25 Custodial category allotments covering 80,339 acres. There are 10 allotments that have not been categorized because they were unallotted at the time the allotment categorization process was implemented. Information specific to each of the 184 allotments in the RFO is provided in Appendix 7.

3.4.2.3 Rangeland Improvement Projects

The BLM and its cooperators have completed structural and nonstructural projects on public lands to improve and manage rangelands since 1943. The nonstructural projects include seeding, plowing, harrowing, chaining, contour furrowing, and herbicide spraying. The structural projects have included wells, pipelines, troughs, fences, guzzlers, reservoirs, and cattle guards.

Non-native seeding has occurred since the 1950s, with most activity occurring in the 1960s. Seeding has been implemented on a very limited scale from the 1970s to the present. The original objectives of rangeland seeding with non-native species were watershed protection and increases in wildlife and livestock forage. Seeding in the Henry Mountains was undertaken to increase forage to accommodate both bison and livestock. Development of various grazing systems resulted in implementing a variety of vegetation treatments (including seedings), which were used to take grazing pressure off adjacent native vegetative communities. Most seedings completed since the 1970s have been developed because of emergency fire rehabilitation on sites that were susceptible to erosion and the invasion of noxious weeds and non-native annual grass species (such as cheatgrass).

As mandated in FLPMA and PRIA, a portion of the grazing fees is invested in range improvements, with the expectation that these improvements may benefit wildlife, watersheds, and livestock producers. Using emergency fire rehabilitation funds, additional public land resources have been protected through rehabilitation of burned areas, thereby reducing soil loss and decreasing the ability of noxious weeds and annual non-native grasses to become established. Livestock operators, state and federal agencies, and other interested public entities have continued to fund rangeland improvement construction.

3.4.2.4 Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration

In May 1997, under the authority of the regulations at 43 CFR 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration), the Utah State Director approved Utah's *Standards for Rangeland Health and Guidelines for Livestock Grazing*. These standards and guidelines provide a clear statement of agency policy and direction for those who use public lands for livestock grazing and for those who are responsible for their management and accountable for their conditions. The fundamentals of rangeland health combine the basic precepts of physical function and biological health with elements of law relating to water quality and plant and animal populations and communities.

The standards are goals for the desired condition of the biological and physical components and characteristics of the rangelands. These standards are measurable and attainable, comply with various federal and state statutes, policies, and directives applicable to BLM rangelands, and are the minimum resource condition that must be achieved and maintained. An interdisciplinary team conducts watershed assessments with participation from permittees and other interested parties. The assessments determine whether the *Standards for Rangeland Health* are being met. The 4 standards for rangeland health are as follows:

- **Standard 1:** Uplands soils are in PFC.
- **Standard 2:** Riparian and wetland areas are in PFC.
- **Standard 3:** Desired species, including native, threatened, endangered, and SSS, are maintained at an appropriate level.
- **Standard 4:** Water quality meets state standards.

In accordance with the regulations at 43 CFR 4180, if existing grazing management and livestock use is a significant factor in the non-attainment of a standard, appropriate actions must be taken that will result in significant progress toward attainment of the standard(s).

3.4.3 Recreation

The recreational resources of the lands managed by the RFO represent some of the most unusual and least explored recreation opportunities in the region. However, in certain parts of the RFO, increased visitor use is affecting soil, water, vegetation, and wildlife. Conflicts among recreationists are also beginning to increase. In some areas, recreation use conflicts with other resources and uses, such as livestock grazing, wildlife habitat needs, and wilderness characteristics.

All of the RFO is included in a recreation fee project in the Henry Mountains/Sevier River area. Participation in the recreation fee program is authorized by the Federal Lands Recreation Enhancement Act (FLREA) and allows an FO to collect fees for specific types of recreational uses, and then expend the fees to manage the lands where they were collected. Monies collected have been used to maintain and improve campgrounds and picnic areas, install new informational signs, replace waterlines and hydrants to supply drinking water, monitor recreation uses, improve hiking trails, and generally improve the recreational experience within the RFO.

3.4.3.1 Recreation Management Areas

Recreation Management Areas (RMA) are BLM's primary means of managing recreational use of the public lands. Public land falls within either a Special RMA (SRMA) or Extensive RMA (ERMA). SRMAs are areas that require a recreation investment, where more intensive recreation management is needed, and where recreation is a principal management objective. These areas often have high levels of recreation activity and valuable natural resources. Under existing LUPs, only a small area at the head of Yuba Lake is established as an SRMA. The Yuba Lake SRMA is and will continue to be managed by the Fillmore FO. All other lands are managed as an ERMA. The ERMA consists of areas in which recreation is nonspecialized and dispersed and does not require intensive management (although such areas may contain recreation sites). Although the primary management objective of the ERMA is not necessarily recreation, the large number of attractive recreation sites and areas make recreation management an important consideration.

3.4.3.2 Special Recreation Permitting

As authorized by 43 CFR 2932, 4 types of uses exist for which special recreation permits (SRP) are required: commercial use, competitive events, organized groups, and recreation use in special areas.

The BLM issues SRPs for noncommercial use in certain special areas, including long-term visitor areas, river use areas, and backcountry hiking or camping areas. The RFO issues noncommercial recreation use permits (RUP) for individual use of 3 fee-site campgrounds. The RFO issued 254 RUPs during the 2004 fiscal year (FY).

Commercial SRPs are issued for commercial and competitive uses of public lands and organized events. SRPs may be issued for 10 years or less, with annual renewal, after which time outfitters must reapply for permits. The permits are issued as a means of managing visitor use, protecting natural and cultural resources, and for providing a mechanism for accommodating commercial recreational uses. The RFO issued 32 SRPs during the 2004 fiscal year. The total number of participants in recreational activities authorized by SRPs during 2004 was 12,008, generating $109,077 in revenue.

3.4.3.3 Recreation Visitation

BLM recreation visitation is recorded in the Recreation Management Information System (RMIS). RMIS estimates recreation participation for 65 types of recreation activities recorded at BLM sites and areas

based on registrations, permit records, observations, and professional judgment. Visitation is estimated by numbers of participants as well as counted by actual visitor days. Participants are the actual number of people who take part in a recreational activity. A visitor day is a common recreation unit of measure used among federal agencies. One visitor day represents an aggregate of 12 visitor hours at a site or area.

In the past decade several activities made substantial contributions to total visitation (e.g., total visitor days) within the RFO. Camping, driving for pleasure, and backpacking were the most common forms of recreation. Aggregate OHV use (attributed to all-terrain vehicles [ATV] as well as cars, trucks, and sport utility vehicles [SUV]) is another common form of recreation. Picnicking, hiking, and viewing wildlife, as well as fishing and big game hunting, were also common recreation activities.

Table 3-23 lists the RMIS figures for the RFO for the FY 2001 through 2004.

Table 3-23. Recreation Visitation

Activity	Oct. 2000–Sept. 2001		Oct. 2001–Sept. 2002		Oct. 2002–Sept. 2003		Oct. 2003–Sept. 2004	
	Participants	Visitor Days[1]	Participants	Visitor Days[1]	Participants	Visitor Days[1]	Participants	Visitor Days[1]
Backpacking	72,368	74,079	54,754	56,338	49,766	50,826	50,786	51,610
Camping	128,418	125,787	98,951	96,285	103,968	100,783	105,128	102,144

Note:
1—A recreation visitor day is equivalent to 12 hours of participation in a given recreational activity.
Source: Bureau of Land Management, Recreation Management Information System.

3.4.3.4 Developed Recreation Sites

The RFO manages a small number of developed recreation sites as shown in Table 3-24.

Table 3-24. Developed Recreation Sites—Richfield Field Office

Site Name	Description
Otter Creek Reservoir Fisherman's Beach Tamarisk Point South Point	Minimal day-use facilities, dispersed camping areas, and fishing access to the reservoir. Primary activities are fishing and boating.
Wolverton Mill	Day-use and interpretive facilities at a relocated cultural site adjacent to the BLM office in Hanksville.
Hog Springs Picnic Area	Day-use facility. The site serves primarily as a roadside rest stop, picnic site, and trailhead.
Lonesome Beaver Campground	Fee site with day-use and camping facilities, along with culinary water. Primary use is camping.
McMillan Spring Campground	Fee site with day-use and camping facilities with culinary water. Primary uses are camping, OHV driving, and viewing bison.
Starr Springs Campground/ Picnic Area	Fee site that features day-use and camping facilities with culinary water. Panorama Knoll Nature Trail and the Starr Ranch are at the site. Site is primarily used for camping.
Dandelion Flat Picnic Area	Day-use and primitive camping facilities with culinary water. Serves picnicking and primitive camping uses. Also serves as a trailhead for Mount Ellen.
Koosharem Reservoir	Minimal day-use facilities. Primarily serves as a roadside rest stop.

3.4.3.5 Recreation Use Conflicts

Recreational activities can conflict with one another and affect the available opportunities and experiences. For example, heavy use of an area by motorized users can displace non-motorized users. Various recreation activities also affect other resources, such as riparian areas, cultural resources, vegetation, wildlife, soils, grazing, and mineral extraction. Specific areas where recreation and/or resource conflict occurs include the Dirty Devil region, Factory Butte, and the Henry Mountains.

3.4.4 Travel Management

Development of the existing transportation system in the RFO has been associated with providing access for resource uses such as mineral development, livestock grazing, and recreation. Increased demand for access to public lands, combined with the research on the impacts of roads to resources and resource uses, has increased the need for a well designed and managed transportation system.

The transportation system includes state, county and BLM system roads, some of which receive regular maintenance. For portions of the transportation system roads that cross BLM-administered land, various government entities and individuals acquire ROWs from BLM. Issuance of ROWs is based on access needs and resource considerations. State and county system roads (depending on class of the road) are usually constructed and maintained to higher standards than BLM roads and provide the primary arterial and collector road systems for access to and through BLM lands. These state and county system roads are not maintained by BLM.

Some locations within the RFO are known and occasionally used for aircraft landing and departure activities that, through such casual use, have evolved into backcountry airstrips. Backcountry airstrips in the RFO receive occasional use by backcountry pilots to camp, explore, or for safety purposes.

In addition to arterial and collector routes, numerous smaller routes lace throughout the RFO that connect more remote locations to the larger roads. These routes are used for recreational purposes, access to range improvements, mineral developments, and non-BLM managed inholdings. Most of these routes are not paved, and most are unimproved in nature; they are of native surface (dirt, gravel, or sand). The BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including Global Positioning System data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways (Map 3-10) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. Detailed route inventory maps by alternative will be available for review at the RFO and on the project website for the Richfield PRMP//FEIS at http://www.blm.gov/ut/st/en/fo/richfield/planning.html. Appendix 9 provides additional details on the travel management/route designation process, the implementation process, and the process that would be required to add or remove route designations following completion of the RMP.

3.4.4.1 Off-Highway Vehicles

Management direction for off-highway vehicles is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy. Resource management plans designate areas as open, closed, or limited, with regards to OHV use. Under the existing LUPs, 77 percent (1,636,400 acres) of the RFO is open to cross-country OHV use, 13 percent (277,600 acres) is limited to existing/designated/maintained routes, and 10% (214,000 acres) is closed to OHV use (Map 2-12).

The number of OHVs registered in Utah grew nearly 70 percent between 2001 and 2004. Registrations of OHVs within counties in the planning area have grown as well. County and statewide OHV registrations are shown in Table 3-25.

Table 3-25. OHV Registrations

County	2001	2002	2003	2004
Garfield County	353	585	569	745

County	2001	2002	2003	2004
Piute County	195	256	281	367
Sanpete County	2,594	3,060	2,969	3,885
Sevier County	3,523	3,819	3,708	4,554
Wayne County	277	344	341	462
State Total	**95,569**	**127,556**	**124,954**	**161,350**

Note: Registrations are for State of Utah fiscal year (July 1–June 30).
Source: Eric Stucki, Utah Division of State Parks, Personal communication 2004.

The 11 WSAs within the RFO are designated as either closed or limited for OHV use. There are 188,600 acres closed to OHV use and 258,300 acres where OHV use is limited to identified routes. Within the use areas, there are 42 miles of inventoried ways within WSAs that are currently open to motorized travel.

The Factory Butte area in the eastern portion of the RFO was identified as open to OHV use under 43 CFR 8342.1 in the 1982 Henry Mountain Management Framework Plan (MFP). One section of land (640 acres), commonly referred to as Swing Arm City, was identified as an OHV activity area. This section of land is where the most intensive use was occurring. OHV use in the Factory Butte area has continued to increase and expand beyond the OHV activity area to the point that OHVs are causing or will cause considerable adverse effects on T&E plant species in the area. In September 2006, a restriction order notice was published in the *Federal Register* for the Factory Butte area. The restriction order limited OHV use to designated routes on 142,023 acres of the Factory Butte area. The order did not affect OHV use within Swing Arm City; 2,602 acres remained open as an OHV activity area, and the 2,200 acres of North Caineville Mesa remained closed to OHV use. This restriction order will remain in effect until the RFO Record of Decision (ROD) becomes final. BLM proposes to designate the Factory Butte area as a SRMA to allow for recreational opportunities while protecting the T&E species.

The Paiute and Great Western Trail systems run through the western and central portions of the planning area. They are managed under a memorandum of understanding (MOU) between the BLM, USFS, the State of Utah, and several local governments. The Paiute Trail System is a 900-mile system that crosses several BLM FO jurisdictions, as well as USFS, state, Native American reservation, and private lands. The RFO manages 136 miles of the Paiute Trail System. A portion of the Great Western Trail System also crosses the planning area, the majority of which is on USFS lands. The Great Western Trail totals 138 miles within the planning area, with only 4 miles on BLM-administered land.

Use of these trail systems has been monitored over the past 9 years using trail counters to provide readings of use trends over time. During the 2003 season, the BLM used 25 infrared trail counters strategically located across the 2 trail systems. Use data are also based on observations and comparisons offered by Paiute Trail rangers, district trail managers, trail hosts, and representatives from the BLM, state parks, Paiute ATV Trail Committee, and the Southern Utah OHV Club. Most use (90 percent) was via ATVs, with motorcycles and jeeps accounting for the remaining 10 percent. The OHV monitoring report does not include snowmobile use.

The Paiute system sustained a 16% use increase between 2002 and 2003, while the Great Western Trail experienced a 4% increase during the same period. Results are reported in Table 3-26.

Table 3-26. Paiute ATV and Great Western Trail Systems Estimated Use

Trail	1995	1996	1997	1998	1999	2000	2001	2002	2003
Paiute ATV Trail	18,000	17,268	24,866	29,663	38,618	43,367	45,310	43,152	50,245
Great Western Trail	5,600	5,450	11,755	11,571	13,514	12,137	14,851	13,579	14,167
Total Annual OHV Use	**23,600**	**22,718**	**36,621**	**41,234**	**52,132**	**55,504**	**60,161**	**56,731**	**64,412**

Source: USFS 2003.

Growth of OHV use has become a significant issue within the planning area because of concerns related to the potential resource degradation that can result from unmanaged use.

3.4.4.2 Transportation and Access (SITLA Lands)

Throughout much of Utah, the State owns and manages four isolated sections in each 36-section township. These are generally sections 2, 16, 32, and 36, and are ordinarily one mile square (640 acres). They are primarily administered by the SITLA for the purpose of economic support of the state's public schools and institutional trust funds. Activities on state land generally are not substantially different from those on the surrounding land administered by BLM. Many of the SITLA lands generate funds through grazing permits, ROW easements and permits, and hydrocarbon or other mineral leases.

Many BLM lands with management restrictions, such as WSAs, have state lands that are adjacent to or within their boundaries. State lands that are completely or almost entirely surrounded by BLM lands with management restrictions, or that are managed with administratively endorsed NPS lands, are termed state inholdings.

Existing access to inheld state lands varies. Some of the parcels have direct access through cherry-stemmed or boundary roads of WSAs. Inheld parcels may or may not currently have access, depending upon whether or not existing vehicle routes lead to them. BLM policy, as required by the Cotter decision, is that "the state must be allowed access to the state school trust lands so that those lands can be developed in a manner that will provide funds for the common school..." This decision confined the issue of access to situations directly involving economic revenues generated for the school trust. For example, if a holder of a state oil and gas lease on a parcel of state land that is completely surrounded by a WSA requires access to develop that lease, BLM must grant the leaseholder reasonable access with consideration given to minimize impacts to wilderness character.

3.4.5 Lands and Realty

Public land policy in the United States fundamentally changed with passage of FLPMA in 1976, which directed that "public lands be retained in Federal ownership, unless as a result of the land use planning procedure provided for in this Act, it is determined that disposal of a particular parcel will serve the national interest…." The lands and realty program is a support program to all other resources and resource uses. The goals of the lands and realty program are to manage the public lands to support the goals and objectives of other resource programs, provide for uses of public lands in accordance with applicable laws and regulations while protecting sensitive resources, and improve management of the public lands through land tenure adjustments. The program responds to requests for ROWs, permits, leases, withdrawals, and land tenure adjustments from other programs or outside entities. The frequency of such requests is anticipated to increase as neighboring communities grow and the demand for use of public lands increases. As a result, future management of the lands and realty program will likely become more intense, complex, and costly.

The primary responsibilities of the lands and realty program include land tenure adjustments, withdrawal review, ROWs, and other land use authorizations. The following sections describe the current conditions and status of the lands and realty program within the RFO.

The planning area comprises approximately 5.4 million acres in Sanpete, Sevier, Piute, and Wayne counties, and portions of Garfield County (Map 1-1). (There are also 21,500 acres of Kane County within the planning area; however, these acres lie entirely within Glen Canyon NRA so no decisions within this RMP will affect those lands.) Within this area, BLM manages 2.1 million acres of public land surface and mineral estate, and an additional 95,000 acres of split estate lands (federal minerals where the surface estate is in state or private ownership). Acreage of split estate lands by county is as follows:

- Garfield County: 7,600 acres
- Piute County: 2,800 acres
- Sanpete County: 40,400 acres
- Sevier County: 36,300 acres
- Wayne County: 7,900 acres.

The BLM also has administrative responsibility for 2,082,865 acres of mineral estate where the surface is managed by other federal agencies (USFS and NPS). Chapter 1 summarizes the surface land ownership within the planning area.

3.4.5.1 Land Tenure Adjustment

Land tenure adjustments are often associated with accommodating public and private needs, fulfilling State of Utah entitlements, allowing community expansion, consolidating public land, acquiring and protecting important resources, acquiring access to public lands, or serving a national priority. All land tenure adjustments must be in conformance with applicable LUPs and be subject to valid and existing rights. BLM uses several authorities to make land tenure adjustments through disposal and acquisition, including FLPMA and the R&PP Act.

Disposals

Lands can be disposed of through sale, exchange, state quantity grant, color of title, state In Lieu selection, desert land entry, Carey Act entry, patent under the R&PP Act or through federal legislation. Public lands have potential for disposal when they are isolated and/or difficult to manage. Disposal actions are usually in response to public request, such as community expansion. Disposals result in a title transfer, wherein the lands leave the public domain. All disposal actions are coordinated with adjoining

landowners, local governments, and current land users. Disposal actions require a site-specific environmental analysis in accordance with NEPA (unless the disposal is a result of federal legislation and is exempted from NEPA review). This NEPA analysis may reveal resource conditions that could not be mitigated to the satisfaction of the authorized officer and may therefore preclude disposal.

Public sales of BLM lands are managed under the disposal criteria set forth in Section 203 of FLPMA and the Federal Land Transaction Facilitation Act. Public lands determined suitable for sale are offered on the initiative of BLM unless their disposal was directed by federal legislation. The lands are sold at not less than fair market value. Specific lands suitable for sale must be identified in the applicable LUP. Any lands to be disposed of through sale that were not identified in the LUP would require a plan amendment before a sale could occur. Public lands classified, withdrawn, reserved, or otherwise designated as not available or subject to sale are unavailable.

Lands can also be disposed of as directed by federal legislation. Two past examples of this within the planning area are:

- Public Law 98-219 (dated February 17, 1984) provided for the transfer of title to 1,273.54 acres of public land within the RFO to the Paiute Indian Tribe of Utah.
- Public Law 102-292 (dated May 26, 1992) transferred title and jurisdiction of 10,172.89 acres of public land within the RFO to the Secretary of Agriculture. These lands were added to and are administered as part of the Fishlake National Forest.

Disposal actions were considered in previous LUPs Of the 5 existing LUPs that cover lands currently administered by the RFO, only the Mountain Valley MFP originally identified lands for sale. These LUPs have subsequently been amended to allow additional land sales. To date, a total of 3,557.63 acres have been sold in the RFO under authority of Section 203 of FLPMA. In addition, since the existing LUPs were prepared, 335.48 acres of public land have been disposed of through exchange; 1,171.94 acres have been disposed of by R&PP sales; 83.02 acres have been disposed of by placer mineral patent; and 640 acres have been disposed of by state grants. Future disposal actions are anticipated, as lands are identified for consideration for disposal to consolidate public land, facilitate community expansion, and remove from federal jurisdiction land parcels that are isolated or difficult to manage.

Acquisitions

Acquisition of lands can be pursued to facilitate various resource management objectives. Acquisitions, including easements, can be completed through exchange, purchase, or donations. Land exchanges are initiated in direct response to public demand, or by BLM to acquire sensitive resources and/or improve management of the public lands. Exchange proposals are evaluated on a case-by-case basis to determine if the proposed exchange would be in the public interest and would achieve RMP goals and objectives. A total of 36.37 acres of private land within the RFO have been acquired by BLM since the existing LUPs were prepared. Future land acquisitions are anticipated, as opportunities arise to acquire access to public lands and protect important resources.

3.4.5.2 Withdrawals

A withdrawal is a formal land designation that has the effect of reserving land for a certain use. Withdrawals remove certain public lands from the operation of one or more of the public land laws, excluding lands from settlement, sale, location, or entry, including under the general mining laws and mineral leasing laws. Withdrawals are used to protect major federal investments in facilities or other improvements, reserve lands for specific purposes and use, support national security, protect resources, and provide for public health and safety.

Section 204(l) of FLPMA requires the review of existing withdrawals to determine whether they are still serving the purposes for which they were made. If the withdrawals are no longer serving their intended purpose, they are to be revoked and the lands opened or partially opened to the uses that were previously prohibited. If withdrawals are determined to still meet the purposes for which they were made, they are recommended for extension for a specific term. While BLM can make recommendations to designate, revoke, or extend withdrawals, only the Secretary of the Interior has the authority to actually take these actions.

Approximately 154,700 acres of public land in the RFO are currently withdrawn for various purposes, as shown in Table 3-27. More detailed information on these existing withdrawals can be found in Appendix 5 (Table A5-7). There are currently no withdrawal applications pending. The lands listed in Table 3-27 are subject to withdrawal review.

Table 3-27. Existing Withdrawals on Public Lands within the RFO

Withdrawal Type	Segregative Effect	Affected Acres
Public Water Reserve	Lands included within public water reserves are withdrawn from settlement, location, selection, sale, or entry. They are withdrawn from location of non-metalliferous minerals.	12,230.77
Henry Mountain Administrative Site	Lands are withdrawn from settlement, sale, location, or entry under the general land laws, including the mining laws, but not to leasing under the mineral leasing laws.	41.21
Federal Energy Regulatory Commission (FERC)	When an application is filed with FERC, the lands are withdrawn from operation of the public land laws. However, the lands remain open to location, lease, or disposal of the mineral estate. The issuance of a FERC permit or license withdraws the lands from operation of the mining laws.	1,207.08
Power Site	Lands are withdrawn from all forms of entry, selection, disposal, settlement, or location.	72.80
Oil Shale	Lands are withdrawn from lease, except oil and gas and sodium leasing, or other disposal, and from appropriation under the general mining laws.	141,144.65
Total		**154,696.51**

3.4.5.3 Rights-of-Way

Approximately 475 ROWs exist within the RFO, authorizing construction, operation, and maintenance of powerlines, electric substations, telephone lines and cables, irrigation and culinary water pipelines, springs and wells used for irrigation and culinary purposes, reservoirs, communication sites, ditches and canals, roads, highways, material sites, and other similar uses. The BLM has granted these ROWs to the State of Utah, various counties, individuals, corporations, rural electric associations, partnerships, and other entities. Whenever feasible, BLM encourages joint use and placement of new facilities in previously disturbed areas such as existing communications sites, roads, and highways. There are no officially designated ROW corridors in the planning area; however, several physical corridors containing facilities are not formally designated by an LUP. The BLM is currently addressing designation of energy corridors in an interagency Programmatic EIS (PEIS) for the Western United States (see Section 1.6.4 in Chapter 1).

Prior to 1982, ROWs for federal aid highway projects were issued using the same procedures as for other ROWs. After 1982, these ROWs were processed in accordance with an interagency agreement. The Federal Highway Administration (FHWA) can request the appropriation of public lands from BLM for highway or mineral material site ROWs for highway purposes only. The BLM then issues a Letter of Consent to FHWA, and FHWA, in turn, issues a Highway Easement Deed to the respective state agency. FHWA administers the deed. Since 1982, the BLM has issued more than 90 authorizations for federal aid highway projects statewide. Several of these projects were connected with the construction and/or associated maintenance of Interstate 70 (I-70), Highway 50, Highway 24, and other major highways in the RFO.

Several major power transmission lines in the western part of the RFO connect to the substation located near Sigurd and to numerous power distribution lines scattered across the RFO. Currently, 16 ROWs authorize culinary water sources within the RFO. Details on these ROWs can be found in Appendix 5.

Communication sites host communication equipment and facilities for various uses, such as television, radio, microwave, seismographic, and cellular services. There are currently 37 communication sites throughout the RFO; the BLM has issued 38 ROW grants for various communication uses at these sites. Detailed information is included in Appendix 5 (Table A5-10).

3.4.5.4 Leases and Permits

Land use permits authorize short-term uses of public land involving little or no land improvement, construction, or investment. They can also authorize uses that cannot be authorized under other authorities. A temporary use permit authorizes short-term use of public land for activities connected with construction, operation, maintenance, or termination of a ROW.

Leases are usually issued for longer periods of time than permits. The BLM can issue the following types of leases:

- Leases issued under the authority of Section 302(b) of FLPMA
- R&PP leases
- Airport leases.

Section 302(b) leases authorize uses such as residential, agricultural, industrial, and commercial, as well as uses that cannot be authorized under other authorities and that involve substantial construction, development, or land improvement and investment. R&PP leases authorize uses such as parks, shooting ranges, cemeteries, sanitary landfills, and other recreation and public purposes. Airport leases, as the name implies, authorize public airports.

R&PP leases have been issued for landfill sites, shooting ranges, parks, and other recreation and public purposes. Since 1982, the BLM has issued approximately 35 R&PP leases for public lands within the RFO, of which 9 are currently active. The decrease in R&PP leases can be partially attributed to a conversion of some leases to patents and also to a change in BLM policy that occurred in 1988. The policy was (and is) that no new sanitary landfill sites would be authorized on public land, that all existing R&PP leases for such sites would be terminated as quickly as possible, and that existing landfill sites would either be sold or closed and rehabilitated. This policy was adopted to minimize the potential liability associated with such sites. The R&PP Act was amended in 1988 to allow the disposal (sale) of public lands to be used for solid waste disposal or for any other purpose that includes the disposal, placement, or release of any hazardous substance. Sites other than landfills that qualify include shooting ranges, municipal water treatment plants, and municipal equipment storage facilities. Presently, all R&PP leases for sanitary landfill sites have been terminated. Of the 9 active R&PP leases in the RFO, 4

authorize shooting ranges. Information about these ranges is included in Appendix 5 (Table A5-11). The other 5 existing leases authorize parks and a riding arena.

3.4.5.5 Renewable Energy

Renewable energy generally is defined as energy derived from sources such as wind, solar, and biomass. Wind energy refers to the kinetic energy generated from wind produced by power-generating turbines. Solar energy includes electricity generated from photovoltaic panels. Bioenergy from biomass refers to energy from organic waste products that are either burned directly or converted to fuels that can be burned to produce energy.

A recent study, *Assessing the Potential for Renewable Energy on Public Lands* (USDI and U.S. Department of Energy [USDOE] 2003), presented a nationwide overview of renewable resources on BLM lands in the western United States. The study employed several screening criteria to consider factors that would affect the economic and technical feasibility of renewable power production. This would help to determine the true potential of an area to produce renewable energy. Screening criteria used in the assessment included access to roads and transmission facilities, available land surface, site condition, land use restrictions, distance to population centers, government policies, and regional market conditions. The primary goal of the assessment was to identify BLM planning units in the western United States with the highest potential for development of renewable energy.

The assessment indicates that portions of the RFO have a high potential for solar, wind, and biomass energy. However, the potential for development of these resources is moderate to low due to their distance from roads, transportation facilities, and population centers. There are no renewable energy facilities currently present within the RFO.

In June 2005, the BLM published the *Wind Energy Development, Final PEIS* (BLM 2005c). This PEIS evaluates the potential environmental and socioeconomic impacts associated with wind energy development on BLM-administered lands in 11 western states over the next 20 years (i.e., 2005–2025). To determine where potential development might occur on the basis of land status and wind energy resources, the National Renewable Energy Laboratory (NREL) constructed a maximum potential development scenario to project the amount of wind power that might be generated over the next 20 years in the 11-state study area. The projection included an assessment of the potential wind power supply and demand. Maps depicting BLM-administered lands with low, medium, and high potential for wind energy development were constructed for each of the BLM FOs in the 11-state study area. These maps serve as only a preliminary screening tool for site selection. Developers must still investigate the properties of the wind regime at any candidate site in much greater detail before assigning a practical value to the site and deciding on a course of development.

High and medium wind resource levels are identified within the easternmost portion of Sevier County, Utah, which is located near 345–500 kilovolt (kV) transmission lines. High and medium wind resource levels are also identified between Loa and Bicknell, east of Hanksville, Wayne County, Utah; and several isolated locations disbursed throughout Garfield County, Utah. Because of the remote nature and lack of existing infrastructure at the Wayne and Garfield County locations, the wind energy may not be economically developable and may create potential economic and resource impacts.

Solar resources are considered minimum to low throughout the RFO (5 to 6 kilowatt hours per square meter per day). The 6 kilowatt hours concentration is primarily located within the northwestern portion of Wayne County, while the 5 kilowatt hours concentration is primarily concentrated within Sanpete, Sevier, and Piute counties.

The programmatic policies and BMPs in the proposed Wind Energy Development Program are appropriate for wind energy development activities in the RFO (see Appendix 15).

3.4.6 Minerals and Energy

BLM minerals management policy falls into 3 categories: leasable minerals, locatable minerals, and salable minerals, which are respectively subject to the Mineral Leasing Act of 1920, the general mining laws, and the Materials Act of 1947, and their respective amendments and implementing regulations. Leasable fluid minerals include oil and gas, coalbed natural gas (CBNG), geothermal resources, and tar sands. Leasable solid minerals include coal and sodium. Locatable minerals include metals such as uranium, molybdenum, gold, copper, and manganese, and can include non-metals such as gypsum and limestone. Salable minerals (mineral materials) include sand and gravel, clay, stone, and humate.

The following sections contain summary information concerning mineral resources within the planning area. More specific information is contained in the *Mineral Potential Report* (BLM 2005b) and the coal resource evaluation reports (Appendix 8). The *Reasonably Foreseeable Development Scenario for Oil and Gas and Geothermal Resources (RFD)* contains information about anticipated activities related to those fluid minerals (Appendix 12).

3.4.6.1 Leasable Minerals

Exploration and development of leasable minerals occurs in several stages of activity. For the BLM, the process of leasing has 3 stages. The first stage (land categorization through land use planning) involves determining which public domain lands are available for leasing and under what conditions. The second stage is leasing. The third stage includes exploration, development, and production operations. Leasing for fluid minerals and solid minerals follows different regulatory requirements specific to 43 CFR 3100 for oil and gas, 43 CFR 3200 for geothermal resources, 43 CFR 3400 for coal resources, and 43 CFR 3500 for non-energy solid minerals. For oil and gas, geophysical operations do not require a lease. Leases include the right to explore (usually drilling) and to develop any producible oil and gas. All oil and gas leases are offered competitively, and if not bid on, noncompetitively for 2 years. Leasing of geothermal resources is similar to oil and gas. Coal resources require a license for exploration, and a lease for development (production). All coal leasing is by competitive bidding. Non-energy solid minerals require a prospecting permit or license for exploration, and leases are offered competitively, by preferential right, or noncompetitively.

For oil and gas leasing, the BLM has developed leasing categories to apply to all public lands to indicate availability for such leasing. The first 3 categories are open subject to the terms of the lease. The fourth category precludes oil and gas leasing altogether. These categories are described below.

- **Open Subject to Standard Lease Terms**—Areas identified as open to exploration and development subject to standard lease terms and conditions.
- **Open Subject to Timing Limitations and/or Controlled Surface Use (CSU) (minor constraints)**—Areas identified with these stipulations are open to exploration and development with relatively minor constraints. A timing limitation would preclude activities during specified time frames to protect resource values such as wildlife species. A CSU stipulation would require proposals for oil and gas activities to be authorized according to the controls or constraints specified, such as a distance or buffer from a particular area.
- **No Surface Occupancy (NSO) (major constraint)**—Areas identified as NSO are open to exploration and development, but with the major constraint of precluding oil and gas activities that use the surface of the land.
- **Closed**—Areas identified as closed are not available for oil and gas leasing.

Leasing for coal involves identifying lands that may have a minable coal resource, applying unsuitability criteria, and considering the impacts of coal exploration and development on other resources and vice

versa. For non-energy solid leasable minerals, lands that are open or closed to leasing must be identified along with any area-wide terms, conditions, or other special considerations needed to protect other resource values during exploration or development.

Oil and Gas

The USGS has identified 8 oil and gas plays within the planning area. These are discussed in detail in the *Mineral Potential Report* (BLM 2005b). In simplest terms, oil and gas are most often found in the pore spaces of sedimentary rocks, such as sandstone and limestone, having migrated there from source rocks, such as marine shales, rich in organic material. When rocks containing this organic material are subjected to heat and pressure, the organic compounds break down over time, resulting in oil and natural gas. As the oil and gas are generated, they migrate through the pore spaces of the rock or along fractures until they encounter a structural or stratigraphic trap with an impermeable seal.

The *Mineral Potential Report* identifies high and moderate potential for oil and gas for the planning area. Most of the planning area has a high potential with a variable degree of certainty. It assigns moderate potential to most of Piute County and a relatively small area east of Factory Butte in Wayne County.

CBNG is a gas associated with coal beds. During the coalification process that accompanies burial, organic matter is converted into coal, and natural gas is produced, along with water, carbon dioxide, nitrogen, and heavier hydrocarbon fractions (Rice 2000). A portion of this natural gas becomes trapped as the coal seam is compacted and can later be extracted as an energy resource.

CBNG is produced by pumping water out of the coal, thereby lowering the hydrostatic pressure, which causes the natural gas to desorb from the coal and migrate through the coal cleats and fractures to the production well. Initially, large amounts of water are produced before natural gas can desorb and begin to flow toward the well bore. As the coal beds are de-watered, natural gas production from the well increases over time. Eventually, gas production declines as ground water production diminishes in the last stages of a well's production.

CBNG production poses some significant environmental issues, most notably the production of large volumes of water, particularly in the early stages of well development. Although water produced from CBNG wells can be potable, it is frequently saline to hypersaline and may contain TDS at concentrations up to 170,000 milligrams/liter (mg/L) (USGS 2000). Produced water from CBNG wells can also have high concentrations of dissolved organic constituents and metals. Depending on the water quality, the produced water is disposed of as waste or used for beneficial purposes, although some treatment is often required. Disposal includes surface discharge, including evaporation or injection in subsurface formations. Uses include livestock watering, irrigation, watering artificial wetlands, or water supplies.

Exploration and development of CBNG differs somewhat from conventional gas within the planning area. Two CBNG plays are identified within the planning area, both associated with Cretaceous coal beds. The Uintah and Piceance Basin play is associated with the Ferron Trend that extends approximately from Price southward onto the Wasatch Plateau. The other play is generally on the west side of the Henry Mountains, east of Capitol Reef. The Ferron Trend is assigned a high potential for the occurrence of CBNG, and the play west of the Henry Mountains is assigned a moderate potential, except for low potential near Factory Butte.

An RFD scenario predicting the likelihood of oil and gas exploration and development over the next 15 years within the planning area was developed as part of this planning effort and is included in Appendix 12. The RFD scenario is summarized in the following paragraphs.

The USGS estimates the distribution of undiscovered, technically recoverable hydrocarbon resources in the planning area to be 0 to 20,000 barrels of oil per square mile. As of 2004, some 220 exploration wells had been drilled in the planning area (IHS Energy Well Data 2004). The historical number of wells drilled each year is slightly more than three.

A discovery of oil in 2004 in western Sevier County at the Covenant field near Sigurd has promoted interest in oil and gas exploration in the western part of the planning area. Since then, the interest in leasing, the number of miles of seismic surveys, and the number of exploration wells has increased substantially and focuses mainly on the Sevier and Sanpete valleys, although other areas within the thrust play are being explored.

Since the discovery, a large area of public land near the Sevier and Sanpete valleys has been nominated for leasing, and the bidding for leases has been very competitive. Map 3-11 shows the current leases in the planning area. The RFD scenario assigns a high level of activity (high development potential) and predicts 360 wells to be drilled in the western part of the planning area near the Sevier and Sanpete valleys.

Additionally, 2 other areas have been of interest for leasing in recent years. On the Manti-LaSal National Forest, federal leases are authorized on the Wasatch Plateau and are associated with the Cretaceous Sandstone and CBNG plays. Only a few leases are authorized on the Fishlake National Forest on the Wasatch Plateau or elsewhere in the Forest at this time, but the BLM anticipates additional leasing in these areas in the future. The RFD scenario predicts 49 wells near the southern part of the Wasatch Plateau with a moderate level of activity (moderate development potential).

The other area that has been of interest for leasing in recent years is in the general vicinity of the Dirty Devil River and the benchlands above the river. As of August 2007, there has been no on-the-ground activity.

Aside from the Sevier and Sanpete valleys and the southern Wasatch Plateau, the planning area is assigned a low activity level (low development potential). In these areas, the historic drilling rate is applicable at 3 wells per year or 45 wells during the next 15 years.

As of April 2007, there are 223 oil and gas leases on BLM land, 3 leases on the Fishlake National Forest, and 30 leases on the Manti-LaSal National Forest.

Geothermal Resources

Geothermal resources found on the federal mineral estate are considered leasable minerals. As such, the same laws governing other leasable minerals cover exploration and development of these resources.

Interest in the potential geothermal resources in Utah increased in the early 1970s, and lease applications were filed for all areas around hot springs or with other evidence of geothermal activity, including the hot springs near Monroe and Joseph within the planning area. The Monroe-Joseph Known Geothermal Resource Area (KGRA) was designated in 1974 due to anticipated interest in leasing geothermal resources in the Sevier Valley. The KGRA contained 16,363 acres in 2 separate parcels surrounding the Joseph hot spring and Monroe-Red Hill springs. Designation of this area as a KGRA meant that future leases could be obtained only through competitive bidding. For the town of Monroe, a limited number of gradient holes and one test production hole were drilled under a USDOE grant to explore the potential of using the geothermal resource for space heating. While the drilling did not locate an adequate resource of high enough temperature for the proposed use, the exploration was very limited.

In the 1980s, interest in geothermal resources waned, and in 1988, the KGRA was declassified after a competitive lease sale without any public interest. Currently, federal geothermal resources in the Sevier Valley or elsewhere in the RFO are not leased.

The *Mineral Potential Report* identifies areas with high, moderate, and low potential for the occurrence of geothermal resources in the planning area. In general, the western part of the planning area is assigned to high and moderate potential, and the eastern part is assigned to low potential.

The area with high potential is centered on the Sevier and Sanpete valleys and flanking ranges. The high potential is based on the known hot springs, including Monroe, Red Hills, and Joseph, and a favorable geologic setting with a relatively high heat flow and with faulting that would appear to provide conduits for the migration of geothermal resources. Monroe and Red Hill springs are located one-half mile east of the town of Monroe, while Joseph hot spring is located 5 miles southeast of the Town of Joseph, all in southwestern Sevier County. Maximum water temperature measured at Monroe, Red Hills, and Joseph range from 151° F. to 171° F. (Utah Geological Survey 2004). Reservoir temperatures have been estimated at slightly over 212° F., which is low for energy production; however, the resource potential has not been extensively explored. Commercial development includes the use of the hot springs at Red Hills and Monroe and a spring at Richfield, both non-federal minerals ownership, for heating swimming pools, a direct use.

The area with moderate potential generally encompasses the Southern High Plateaus and adjacent valleys not included in the area of high potential in the western part of the planning area. The eastern part of the planning area is considered low potential. The *Mineral Potential Report* characterizes geothermal resource development as unlikely in the next 15 years. However, the first competitive geothermal resource lease sale will be held this year (2007) for federal minerals at the Cove Fort-Sulphurdale KGRA, west of the planning area in Beaver and Millard counties, and interest in geothermal resources for energy production is increasing statewide.

The lands managed by the RFO are open to geothermal leasing, subject to the oil and gas leasing categories. As previously stated, no federal lands are currently leased for geothermal resources in the RFO.

Oil Shale and Tar Sands

Oil Shale

Oil shale is a very fine-grained, dense, sedimentary rock that is rich in organic material. This organic material can be converted into low viscous oil during thermal decomposition. In the planning area, oil shale deposits occur in the Green River Formation in Sanpete County and Sevier County.

In the planning area, lands with surface exposure of the Green River Formation were withdrawn from lease or other disposal by EO in 1930 in order to reserve the oil shale for the purposes of investigation, examination, and classification. Subsequent EOs and public land laws have modified the original EO. The withdrawal generally overlaps parts of the Gunnison Plateau, the Valley Mountains, and the Wasatch Plateau. The lands withdrawn for oil shale investigation are open to oil and gas as well as sodium leasing but are closed to mineral entry (mining claim location and operations) and certain realty actions. The federal lands withdrawn for oil shale investigation are shown on Map 11 in the *Mineral Potential Report* and are classified as prospectively valuable for oil shale. The *Mineral Potential Report* does not address oil shale because only limited information is available on the mineral potential in the RFO.

Under the Energy Policy Act of 2005, the BLM is required to develop regulations for leasing oil shale deposits. This leasing of oil shale, as well as tar sands, is being addressed in the ongoing Oil Shale and Tar Sands Leasing PEIS for the Western United States (Section 1.6.3 in Chapter 1).

Tar Sands

Tar sands are loosely defined as any sedimentary rock impregnated with heavy, viscous crude oil that cannot be recovered by conventional techniques but rather requires an external energy source (e.g., heat) to mobilize the oil. Tar sands are also called bituminous sandstone, oil sands, and oil-impregnated rocks. In the planning area, the heavy oil is contained in sandstone, not sand as in Alberta, Canada, where these types of resources are currently being developed.

Areas of high and moderate tar sand occurrence potential were identified in the planning area. In eastern Wayne and Garfield counties, high potential is assigned to the Tar Sand Triangle, which is primarily east of the Dirty Devil River, and to the Circle Cliffs in the vicinity of Capitol Reef National Park. The Tar Sand Triangle encompasses approximately 230 square miles with an estimated 16 billion barrels of oil. At the Circle Cliffs, the Waterpocket Fold (Capitol Reef) is the eastern limb of the Circle Cliffs structure, and the western limb is in Grand Staircase-Escalante National Monument. The Circle Cliffs are estimated to contain more than 860 million barrels of oil. The Tar Sand Triangle and the Circle Cliffs, in part, are defined as Special Tar Sand Areas (STSA) because they contain known and delineated tar sand occurrences. In addition to the STSAs, there are indications of tar sand deposits in scattered outcrops along the Waterpocket Fold, and the occurrences are assigned a moderate potential for tar sand resources.

Tar sands contain heavy oil that could be mined or developed by drilling, depending on the depth of the deposit below the surface and the extraction method chosen. In addition, the federal lands with tar sand deposits also have a high potential for oil and gas. In an attempt to address the leasing of both oil and gas and tar sands, the Combined Hydrocarbon Leasing Act was passed in the early 1980s authorizing exploration and development of both conventional oil and gas and tar sands in a combined lease for both, which were called combined hydrocarbon leases (CHL). Existing oil and gas leases within the STSAs were to be converted to CHLs; however, this conversion process was never completed and the market for oil and gas declined starting in about 1985. A number of existing oil and gas leases are pending conversion to CHLs in the STSAs (Maps 10 and 22 of the *Mineral Potential Report*).

Under the Energy Policy Act of 2005, the BLM is required to develop new regulations for leasing tar sand deposits. As stated above, this leasing of tar sands, as well as oil shale, is being addressed in the ongoing Oil Shale and Tar Sands Leasing PEIS for the Western United States (Section 1.6.3 in Chapter 1).

Coal

Significant coal resources are delineated in 3 coal fields within the planning area—the Wasatch Plateau, Emery, and Henry Mountains coal fields (Map 3-12). The coal resources within the planning area were evaluated for development potential based on available coal data; assumptions for depth, thickness, and continuity of the deposits; and assumptions on the parameters for certain mining methods. The most data exist for the Wasatch Plateau coal field; and the least are available for the Henry Mountains. The estimated unleased coal resources with development potential at each coal field are as follows: more than 290 million tons at the Wasatch Plateau, 199 million tons at the Emery, and 1,750 million tons at the Henry Mountains. The coal at the Wasatch Plateau would be mined by underground methods; the Emery, underground mostly (190 million tons); the Henry Mountains, surface and underground methods (466 million tons and 1,284 million tons, respectively).

Federal coal leases were authorized at all 3 coal fields in the past, mainly in the 1970s and early 1980s. Development has only occurred at the Wasatch Plateau coal field. At present, the Wasatch Plateau coal field is the only coal field within the planning area with a producing coal mine. The SUFCO Mine in Sevier County includes 7 federal coal leases and accounts for about one-quarter of the total coal production in Utah; the coal production exceeds any other coal mine in Utah. Approximately, 24,000 acres of public lands are under lease at the SUFCO Mine.

BLM acknowledges that the Flat Canyon Tract for the Skyline Mine is located on the Manti-LaSal National Forest and contains lands in Sanpete County (located in the west part of T. 13-14 S., R. 6 E.) with federal coal reserves. This new tract could have the potential for coal development that is not considered in the current unsuitability reports (Appendix 8).

Production and revenue figures are contained in Table 3-28.

Table 3-28. Sevier County Coal Production[1] (1984–2001)

Year	Units[2]	Revenues[3]
1984	2,141,000	$96,113,384
1985	1,797,000	$74,079,461
1986	2,360,000	$94,657,512
1987	2,228,000	$80,983,867
1988	2,625,000	$82,325,371
1989	3,059,000	$88,794,500
1990	2,887,000	$79,919,360
1991	3,079,000	$81,211,800
1992	2,580,000	$67,144,882
1993	3,553,000	$87,581,011
1994	3,569,000	$81,639,793
1995	3,906,000	$83,269,860
1996	4,214,000	$85,263,758
1997	4,939,000	$97,173,834
1998	5,719,000	$107,867,625
1999	5,763,000	$104,468,169
2000	5,906,000	$102,298,887
2001	6,111,000	$108,531,360

Notes:
1—No coal production was reported in Garfield, Piute, Sanpete, or Wayne counties between 1980 and 2001.
2—Units are shown in short tons (2000 pounds).
3—Revenues are in 2001 dollars.
Source: BLM 2003b.

On the basis of coal resource evaluations prepared in 2004–2005, exploration and development of coal resources in the Wasatch Plateau coal field are anticipated; however, coal resources in the Emery and Henry Mountains coal fields are not anticipated to be developed within the planning time frame, i.e., before 2030. This forecast for coal resources is likely to change because market conditions for coal are likely to change.

Non-Energy Solid Leasable Minerals

Non-energy solid minerals include sodium and potassium. Such minerals in the RFO include salt and alunite. There are currently no prospecting permits or leases for non-energy solid leasable minerals in the RFO. The Sevier and Sanpete valleys, in part, are underlain by deposits of salt and other evaporitic

minerals, and near Marysvale, alunite deposits are associated with the volcanic rocks. Salt is currently mined on private land near Redmond, but there is no current interest in leases on BLM-administered lands. Alunite is an alteration of volcanic rock as clay. Depending on the composition and the proposed use, alunite could be a leasable mineral.

Salt

Saline deposits are loosely defined to include all minerals that have precipitated through evaporation from waters of either marine or continental origin (USGS 1969). Saline potassium minerals, such as sylvite and carnallite, are often referred to as potash, and the most common sodium mineral is halite, which is composed of sodium chloride. Other valuable salts include potassium sulfate, sodium carbonate, sodium sulfate, and salts of magnesium, lithium, bromine, and boron. Saline deposits, explored and prospected for their sodium and potassium content, would be considered as non-energy solid minerals. Within the planning area, salt deposits occur in the Arapien Shale in Sevier and Sanpete valleys and in the Pennsylvanian Paradox Formation in the subsurface in the eastern part of the planning area.

Salt mining has a long history in the Sevier Valley, dating back to 1879; it was the first mineral resource produced in the valley. Salt has been prospected at several locations in the Arapien Shale in the Sevier and Sanpete valleys, but there is only 1 mine now operating, which is the RCS salt mine located on private land near Redmond. This is the only current salt-producing mine in Utah besides those on the Great Salt Lake (UGS 2002).

Areas of high salt occurrence potential were identified in the Sevier-Sanpete Valley and in eastern Wayne County. Development of salt deposits on BLM-administered lands within the planning area is considered unlikely in the next 15 years.

Potassium (Alunite)

Alunite may be a non-energy leasable mineral if it is explored and developed for its potassium content. Alunite is either a vein deposit or a clay alteration product, both associated with Tertiary volcanic terranes near Marysvale. The altered alunite deposits are closely associated with other clays such as kaolinite. In the *Mineral Potential Report*, clays including alunite were considered as clay only, rather than differentiating specific clays as alteration types.

Alunite was historically mined near Marysvale. The vein deposits, southwest of Marysvale, were extensively mined during World War I, as were some altered alunite deposits north and east of Marysvale. The alunite was mined for potassium for use as an explosive material. Subsequently, during World War II, the alunite deposits were investigated as a possible source for alumina; however, alumina deposits in the Pacific Northwest were more prevalent and cheaper to process into aluminum. Following World War II, primarily in the 1950s and 1960s, the deposits were still evaluated as an alumina source as well as for potassium for fertilizer. Since then, given the variable chemical composition of alumina, potassium, and other constituents, the deposits have generated only limited interest.

3.4.6.2 Locatable Minerals

Locatable minerals include base metals (such as copper, lead, and zinc), precious metals (such as gold and silver), and some industrial minerals. Locatable minerals are subject to the U.S. mining laws, including the 1872 Mining Law, and are subject to location as mining claims and mineral entry (patenting). Open, unappropriated public land is open to entry and location, unless it has been withdrawn from the operation of the mining laws. Operations under the mining laws are subject to the "undue and unnecessary" standard in the regulations at 43 CFR Part 3809, and operations in WSAs are subject to the provision under the *Interim Management Policy for Lands Under Wilderness Review (IMP)* regarding non-

impairment of suitability for inclusion in the Wilderness Preservation System. Another locatable mineral management tool is 43 CFR 3715 regulations. These regulations limit use and occupancy of public lands for locatable development to that which is reasonably incident.

Developers of these minerals stake a mining claim (location) over the deposit and then acquire the necessary permits to explore or mine. As of October 2004, there were 4,199 active (recorded) mining claims in the planning area, and 3,158 of those are located on BLM-administered lands (March 2007, LR2000 database) (Map 3-13). In addition, 9 authorized Mining Law Notices are filed in the RFO, 1 plan of operation is pending approval, and 1 plan of operations is pending closure when reclamation is complete (May 2007, LR2000 database).

Metals

Historically, metals have been prospected near Marysvale, the Henry Mountains, and the Colorado Plateau. Historically, gold, lead, and zinc have been mined in the vicinity of the Tushar Mountains near Marysvale; gold and copper have seen limited development in the Henry Mountains; and uranium has been mined in the Antelope Range north of Marysvale and in the Colorado Plateau. These mines were generally small-scale, underground operations.

The *Mineral Potential Report* assigns high, moderate, and low potential for the occurrence of metals in the planning area. The Colorado Plateau in the eastern part of the planning area is rated as having high potential for metals, including uranium, vanadium, and copper (due to favorable sedimentary deposits, known occurrences, and historic mining), as well as gold (due to known occurrences and favorable intrusive rocks). The western part of the planning area, generally near Marysvale, is assigned high potential for metals, including uranium, due to the presence of volcanic and intrusive rocks, known occurrences of precious and base metals and uranium, and historic mining. In the western part of planning area, moderate potential is assigned to the volcanic terrane outside the area of prevalent mineral occurrences and historic mining, and low potential is assigned to the area not associated with volcanic deposits.

The *Mineral Potential Report*, prepared in 2005, is based largely on market conditions in 2003 when metal prices were generally low. Since that time, the market value of uranium and other metals, including gold, has increased significantly, and exploration and development for metals are more likely under current market conditions. A substantial number of new mining claims have been located since 2005, most notably for uranium, and exploration activity for uranium in the RFO has increased. Between October 2004 and March 2007, the number of mining claims increased from approximately 1,000 to 5,000. In September 2007, the RFO granted an operating permit for the Tony M Mine uranium mine in Ticaboo in Garfield County. A few exploratory permits were also issued in 2007. Although development was considered unlikely in the *Mineral Potential Report*, exploration activity is likely to increase, and development is more likely than that reflected in the *Mineral Potential Report* due to current market conditions in 2007.

Gypsum

Gypsum is formed by the evaporation of seawater and precipitation of calcium sulfate. Gypsum frequently occurs interbedded with limestone and calcareous shales. Most gypsum mined in Utah, as well as in the United States, is processed for plaster and used in the manufacture of wallboard, lath, and other prefabricated gypsum products. Raw gypsum is used in Portland cement as a setting retardant and in agriculture as a soil amendment.

Within the planning area, exploration and development of gypsum resources has been focused in the Sevier and Sanpete valleys. Gypsum has been mined from the Arapien Shale since 1918. The gypsum deposits in the Sevier Valley are centrally located in Utah, and wallboard and other products are shipped

to regional markets. Mills for processing gypsum are operated by U.S. Gypsum and Georgia-Pacific Corporation near Sigurd; the primary product being wallboard. In addition, Diamond K has constructed a mill at Richfield that processes pulverized gypsum for pharmaceutical uses; the gypsum for that use is mined within the San Rafael Swell. In Utah, gypsum production was 500,000 tons in 2000 and 390,000 tons in 2001.

In the *Mineral Potential Report*, high potential for the occurrence of gypsum was assigned within the planning area. In the Sevier and Sanpete valleys in the western part of the planning area, high potential is assigned to the known occurrence of gypsum associated with the Arapien Shale. In the eastern part of the planning area, gypsum also occurs in the Summerville and other formations; however, gypsum does not occur in beds that are economic to develop at this time.

Development in the Sevier and Sanpete valleys will likely continue over the next 20 years. The *Mineral Potential Report* considers commercial development elsewhere unlikely.

3.4.6.3 Salable Minerals

Salable minerals are mineral materials, subject to the Materials Act of 1947, the Surface Resource Act of 1955, and the regulations at 43 CFR 3600. Mineral materials include sand, gravel, clay, and stone. These minerals are disposed by sale contracts and by free use to government agencies and non-profit organizations. Disposal sites may be authorized for exclusive use and non-exclusive use; non-exclusive use disposal sites are community pits and common-use areas. The BLM will not dispose of salable minerals in areas not available by law (e.g., wilderness areas) or in areas identified in LUPs as not appropriate for disposal.

As of May 2007, 18 authorized community pits in the RFO provide commodities such as sand, gravel, topsoil, fill material, and stone. There are 7 exclusive, negotiated sales that provide riprap, sand and gravel, oyster shell, humate, and stone; and also 15 exclusive, free-use permits in the RFO that provide sand and gravel and fill material. Most of these mineral material sites are for the disposal of sand and gravel material (LR2000 database).

The FHWA also obtains sand and gravel and other mineral materials for federal highways and federal aid highways. These disposal sites are not authorized as salable minerals under the regulations at 43 CFR 3600. The disposals are authorized as a mineral material ROW under the regulations at 43 CFR 2800. These ROWs are obtained by the FHWA.

Sand and Gravel

Past and present exploration and development of sand and gravel deposits in the planning area has been for local public works projects. The largest single project was the construction of I-70 in the 1970s through the early 1990s. Because sand and gravel are generally the lowest-priced of industrial mineral products, transportation costs from the pit to the point of end use are a large part of the cost to consumers. Consequently, even short transportation distances can adversely affect the cost of the final product, and it is imperative that sand and gravel sources be located as close as possible to the point of use and major roadways. For this reason, the sand and gravel industry is widely dispersed across Utah, and disposal sites are generally associated with roadways and near population centers.

Most sand and gravel disposals in recent years have been to county road departments. Typically, the counties permit disposals between 10,000 and 20,000 cubic yards per year. Commercial disposals vary in volume, and most contracts are issued from community pits where the volume ranges from 30 to 500 cubic yards per individual sale.

Clay

Clay is generally a salable mineral and is used for a variety of commercial and industrial purposes, including bricks, drilling and quarrying mud, sealants, liquid dyes, paints, china, ceramics, absorbents, molecular sieves, fillers, binders, cosmetics, and inert ingredients in pharmaceutical tablets. The end use of the clay is determined by its physical properties and purity. Physical properties that determine clay usage include plasticity, bonding strength, color, vitrification range, deformation with drying and heating, gelation, crystal structure and size, viscosity, and swelling capacity (USGS 1969). Bentonite and bentonitic clays are among the most desirable; they swell when saturated with water and can be used as natural sealants for reservoirs, stock ponds, ditches, and landfills. High-swelling bentonite is used primarily by the petroleum industry as a component of drilling mud and by the iron industry as a binder in casting molds and casts. As discussed under Section 3.4.6.1, alunite may be a non-energy solid leasable mineral if it is explored and developed for its potassium content, or a salable mineral as a clay (as an alteration product of volcanic rocks).

In Utah, the most common use for clay is for brick and tile. Within the planning area, clay has been used for swelling clays such as bentonitic clay, reservoir liner material, Fuller's earth, and other applications. Most of the clay resources in the planning area have a volcanic association.

On the western side of the planning area, high potential for the occurrence of clay has been assigned near Marysvale because of the alteration zones in the Tertiary Volcanics and known clay deposits in the Sevier Valley, which are also associated with volcanic deposits. This high potential includes alunite deposits. Moderate potential is assigned to the area with volcanic rocks, but where clay alteration is unreported. Two active clay mines exist at Box Creek on the Sevier Plateau in the Fishlake National Forest and at the Redmond clay mine north of Redmond on private land. Other clay deposits have been explored and/or mined in the past on a small scale in the western part of the planning area. In the last 3 or 4 years, a clay prospect in the Antelope Range, north of Marysvale, has been explored for the manufacture of cement and other possible uses.

In the eastern part of the planning area, high potential for clay is associated with outcrop (surface exposure) of the Morrison Formation and Dakota Sandstone. These deposits have been prospected mainly for swelling clays with minor, small-scale development, mostly for local use.

As stated in the *Mineral Potential Report*, clay is likely to be developed on BLM-administered land during the planning horizon of 15 years, but such development is likely to remain relatively small scale.

Stone

Stone quarries are found throughout Utah and generally are small-scale operations. Transportation cost is a factor in the location of quarries. Most of the stone quarried in Utah and in the planning area is used by the construction industry for building stone, aggregate (crushed rock), or cement (pulverized limestone). Volcanic tuffs in Sevier and Sanpete counties have been quarried for use as dimension stone, crushed for lightweight aggregate in the manufacture of building block, and used as a soil amendment or as nutritional supplement for certain livestock animals, primarily poultry.

In the planning area, stone has been quarried from the following formations for the specified use:

- Limestone of the Green River Formation—building stone
- Sandstone of Crazy Hollow—building stone
- Limestone of the Flagstaff Formation—rock dust, kiln material, and cement manufacturing
- Tuff of the Moroni Formation—poultry feed and agricultural uses
- Tuff of the Joe Lott Tuff—building stone and crushed aggregate as an insulating block
- Tuff of the Bullion Canyon Volcanics—decorative rock (landscape and aquarium display)

- Sandstone of the Moenkopi Formation—building stone
- Navajo Sandstone—decorative rock.

In addition to quarried stone, the public has used pick-up stone or field stone. This material is generally boulders or cobbles and is present in numerous locations in the planning area. The areas that have the most use for collection are generally close to the population centers, and the material of interest has mainly included basalt, tuff, sandstone, or limestone. The demand has been relatively low, and the material is disposed in small tonnages. Although field stone is present throughout the planning area, the principal areas of interest have been in the Sevier Valley and near Loa.

Most of the stone quarries in the planning area are relatively small disposal sites, generally less than 5 to 10 acres. The disposals from BLM public lands range from a few tons to a few thousand tons per year. Development on a small scale at many quarries is likely to continue.

Humate

Humates are carbonaceous shale associated with weathered coal beds. The material is mined as a dietary colloidal mineral supplement and as a soil amendment for agricultural applications. Humate increases the water holding and ion exchange capacity of the soil, acts as a pH buffer for alkaline soils, and may aid animal and plant growth as humic acids. Most humate in Utah is mined from coal beds in the Ferron Sandstone of the Mancos Shale. The only active mining in the planning area is near Factory Butte in Wayne County.

In the planning area, high potential for occurrence of humate has been assigned to Ferron Sandstone outcrop in the vicinity of Factory Butte, north of the Henry Mountains and to the east side of the Wasatch Plateau. Moderate potential is assigned to the west side of the Henry Mountains, and low potential is identified in the central and western part the Wasatch Plateau.

As stated above, the only authorized active mining for humates in the planning area is north of Highway 24, near Factory Butte; 2 sites are BLM-authorized contracts, and 1 is on State land. The mines are relatively small and only active periodically. Exploration and development are likely to continue near Factory Butte on a small scale and are not considered likely elsewhere in the planning area.

Other Minerals

Other mineral materials considered in the *Mineral Potential Report* include oyster shell, petrified wood, jasper, agate, and chalcedony. Oyster shell from the Dakota Formation has been used for road surfacing in Wayne County. There is also interest in oyster shell for agricultural use. It is considered unlikely that the other mineral materials considered will be developed beyond hobby or casual use within the next 15 years.

3.5 SPECIAL DESIGNATIONS

3.5.1 Wilderness Study Areas

In 1964, Congress passed the Wilderness Act establishing (1) a national system of lands to preserve a representative sample of ecosystems in their natural condition for the benefit of future generations, and (2) a process for reviewing other lands for their wilderness potential. The act originally applied only to national forests, national parks, and national wildlife refuges. With the passage of FLPMA in 1976, Congress directed BLM to also inventory, study, and recommend which public lands under its administration should be designated wilderness.

In 1979, the BLM began a wilderness inventory of 22 million acres of public land in Utah. By 1986, following the inventory and public inventory process, and the settlement of appeals, the BLM designated 11 WSAs within what is now the RFO (Table 3-29 and Map 3-14). These WSAs total 446,900 acres, about 21 percent of the RFO. A discussion of the current resource values and uses in each WSA, established in 1980 under the authority of Section 603(c) of FLPMA, can be found in the *Utah BLM Statewide Wilderness Final Environmental Impact Statement* (BLM 1990b). Those values and resources described in the 1990 document have not changed significantly since that time, as documented in monthly WSA monitoring reports available in the RFO.

Although WSAs are, by definition, roadless, several of the WSAs in the RFO do include inventoried ways. During the 1979–1980 Utah Wilderness Inventory, it was necessary to divide routes used by motorized vehicles into "roads" and "ways." To be considered a road, 3 criteria must be met: (1) constructed; (2) maintained by mechanical means; and (3) regular and continuous use. All other motorized routes were defined as ways, which could be left open to motorized travel as long as their use did not "impair" the suitability of the area for wilderness designation. Decisions on which ways will remain open and which will be closed will be made as part of this land use planning process. The miles of inventoried ways are identified by WSA in Table 3-29. Map 3-10, Route Inventory for the RFO, depicts routes and how they overlay with WSAs.

Table 3-29. Wilderness Study Areas

Wilderness Study Area	Acreage	Number of Inventoried Routes	Miles of Inventoried Ways
Bull Mountain	13,200	7	3.9
Dirty Devil	72,100	21	15.6
Fiddler Butte	74,000	8	5.5
Fremont Gorge	2,800	1	0.2
French Spring/Happy Canyon	24,300	3	3.6
Little Rockies	40,700	3	1.3
Mount Ellen/Blue Hills	81,400	12	9.3
Mount Hillers	19,300	9	6.6
Mount Pennell	77,100	9	8.1
Horseshoe Canyon (south)	39,900	4	5.6
Portion of the Horseshoe Canyon (north)	2,100	0	0

Wilderness Study Area	Acreage	Number of Inventoried Routes	Miles of Inventoried Ways
Total	**446,900**	**77**	**59.7**

FLPMA Section 603(c) directs the BLM to manage the WSAs in a manner that does not impair their suitability for designation as wilderness. The *Interim Management Policy for Lands Under Wilderness Review* (BLM Handbook 8550-1) provides policy guidance to manage WSAs to a non-impairment standard. The wilderness characteristics that must be protected include the appearance of naturalness and outstanding opportunities for primitive and unconfined recreation. The status of the existing WSAs will not change as a result of the Richfield RMP. Only Congress can designate the WSAs as wilderness or release them for other uses.

BLM policies and guidance providing for management of existing WSAs and consideration of values associated with wilderness characteristics in land use planning are detailed in:

- Handbook H-1601-1, *Land Use Planning Handbook*
- Hand book H-8550-1, *Interim Management Policy and Guidelines for Lands Under Wilderness Review*.

The BLM's IMP provides specific policy and guidance for management of most resource values and uses in WSAs. However, VRM decisions and OHV designations and route designations are made during land use planning. A summary of some aspects of WSA management are as follows:

- The non-impairment standard applies to all uses and activities except those specifically exempted from this standard by FLPMA (grandfathered uses and valid existing rights).
- Activities that are permitted in WSAs (except valid existing rights and grandfathered uses) must be temporary, create no new surface disturbance, and not involve the permanent placement of structures. There are exceptions to this standard.
- Grazing, mining, and mineral leasing uses that existed as of the passage of FLPMA (October 21, 1976) may continue in the same manner and degree, even if this would impair wilderness suitability.
- WSAs may not be closed to location under the mining laws in order to preserve their wilderness character (although the wilderness character of the area cannot be impaired through actions to perfect claims located after October 21, 1976). Valid existing rights will be recognized.
- WSAs will be managed to prevent unnecessary and undue degradation, as required by law.

3.5.2 Wild and Scenic Rivers

The Wild and Scenic Rivers Act of 1968 established legislation for a National Wild and Scenic Rivers System to protect and preserve designated rivers throughout the nation in their free-flowing condition and to protect and preserve their immediate environments. The act includes policy for managing designated rivers and created processes for designating additional rivers for the National Wild and Scenic Rivers System. Section 5(d) of the Act directs federal agencies to consider the potential for national wild, scenic, and recreational river areas in all planning for the use and development of water and related land resources.

The first phase of the WSR review was to inventory all potentially eligible rivers within the RFO to determine which of those rivers were eligible for consideration as part of the National Wild and Scenic Rivers System. To be eligible, rivers must be free-flowing and possess at least one outstandingly remarkable value. Outstandingly remarkable values are evaluated in the context of regional and/or national significance, and must be river-related. Each river/segment determined to be eligible is then given a tentative classification based on the current level of human development associated with that river/segment. The tentative classification is based on the criteria listed in the classification table from *Wild and Scenic River Review in the State of Utah* (BLM 1996) as noted below.

- A "*wild*" river is free of impoundments, with shorelines or watersheds essentially primitive, and with unpolluted waters.
- A "*scenic*" river may have some development, and may be accessible in places by roads.
- A "*recreational*" river is accessible by road (or railroad), may have more extensive development along its shoreline, and may have undergone some impoundment or diversion in the past.

The BLM conducted a WSR review as part of this planning process. The BLM inventoried 304 drainages/rivers/streams in the lands managed by the RFO. Of those, 12 segments totaling 135 miles were determined to be free-flowing and possess one or more outstandingly remarkable values, making them eligible for further consideration for inclusion in the National Wild and Scenic Rivers System. The eligible rivers, along with their outstandingly remarkable values, tentative classifications, and river miles, are shown in Table 3-30 and on Map 3-15. Detailed descriptions and analysis can be found in Appendix 2 and Appendix 3. BLM policy requires protection of the outstandingly remarkable values, tentative classification, and free-flowing nature of eligible river segments on a case-by-case basis until a suitability determination is made. For rivers designated as suitable as a result of this planning effort, protections for wild and scenic values will continue, and the decisions in the RMP will support such protection. Rivers designated as not suitable will not be managed for wild and scenic purposes but rather in conjunction with other decisions in the RMP.

Table 3-30. Eligible Wild and Scenic Rivers

River or River Segment	Outstandingly Remarkable Value(s)	Tentative Classification	BLM Miles
Dirty Devil River	Scenic, recreational, geologic, fish and wildlife, cultural	Wild	54
Beaver Wash Canyon	Scenic, ecological	Wild	6.8
Larry Canyon	Scenic, recreational, wildlife, ecological	Wild	4
No Mans Canyon	Scenic, recreational, cultural	Wild	7.1
Robbers Roost Canyon	Scenic, recreational, historic, cultural	Wild	31
Sams Mesa Box Canyon	Scenic and wildlife	Wild	9.5

River or River Segment	Outstandingly Remarkable Value(s)	Tentative Classification	BLM Miles
Twin Corral Box	Scenic and wildlife	Wild	9
Fish Creek	Cultural	Scenic	.25
Fremont River—Fremont Gorge	Scenic	Wild	5
Fremont River—Capitol Reef NP to Caineville Diversion	Scenic and geologic	Recreational	4
Maidenwater Creek	Scenic, recreational, geologic, wildlife, ecological	Scenic	3
Quitchupah Creek	Cultural	Recreational	1.4
Total BLM Miles:			**135.05**

3.5.3 Areas of Critical Environmental Concern

FLPMA defines an area of critical environmental concern (ACEC) as an area "within the public lands where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards" (43 CFR 1601.0-5 (a)). Private lands and lands administered by other agencies are not included in the boundaries of ACECs.

FLPMA states that the BLM will give priority to the designation and protection of ACECs in the development and revision of LUPs. ACECs differ from some other special designations in that designation by itself does not automatically prohibit or restrict other uses in the area. The special management attention is designed specifically for the relevant and important values, and therefore varies from area to area. The one exception is that a mining plan of operation is required for any proposed mining activity that would create surface disturbance greater than casual use within a designated ACEC (in accordance with 43 CFR 3809).

To qualify as a potential ACEC, both relevance and importance criteria outlined in 43 CFR 1610.7-2 must be met. These criteria are defined as:

- **Relevance:** A significant historic, cultural, or scenic value; a fish or wildlife resource or other natural system or process; or a natural hazard must be present.
- **Importance:** The value, resource, system, process, or hazard must have substantial significance and value. This generally requires qualities of more than local significance and special worth, consequence, meaning, distinctiveness, or cause for concern.

3.5.3.1 Existing Areas of Critical Environmental Concern

There are currently 4 ACECs in the RFO. These ACECs, and their relevant and important values, are listed in Table 3-31. Refer to Map 3-16 for their locations.

Table 3-31. Existing Areas of Critical Environmental Concern

Area	Acreage	County	Relevant and Important Values
North Caineville Mesa ACEC	2,200	Wayne	Relict vegetation
South Caineville Mesa ACEC	4,100	Wayne	Relict vegetation
Gilbert Badlands Research Natural Area ACEC	3,680	Wayne	Natural systems or processes—badlands
Beaver Wash Canyon ACEC	4,800	Wayne	Natural processes, riparian
Total Acreage:	**14,780**		

North Caineville Mesa ACEC (2,200 acres)

The 1982 Henry Mountain MFP designated the North Caineville Mesa ACEC as an ACEC to protect the relict vegetation found on the top of the mesa. The ACEC is located north of Highway 24, about 12 miles west of Hanksville. Current management for this ACEC includes the following:

- Closed to OHV use
- Unavailable to livestock grazing
- Consider withdrawing from mineral entry

- Aquire inholdings within the ACEC
- Open to leasing for oil and gas with major constraints (NSO).

South Caineville Mesa ACEC (4,100 acres)

The 1982 Henry Mountain MFP designated the South Caineville Mesa ACEC as an ACEC to protect the relict vegetation found on top of the mesa, as well as the historic resources that include a circa 1920 bilevel stone cabin associated with early area sheep and goat grazing. South Caineville Mesa is located south of Highway 24, about 12 miles west of Hanksville. Located entirely within the Mount Ellen/Blue Hills WSA, the South Caineville Mesa ACEC is subject to management under the IMP (BLM H-8550-1). Current management for this ACEC includes the following:

- Closed to OHV use
- Unavailable for livestock grazing
- Closed to leasing for oil and gas
- Consider withdrawing from mineral entry.

Gilbert Badlands Research Natural Area ACEC (3,680 acres)

The Gilbert Badlands Research Natural Area (RNA) ACEC was designated in 1987 to protect the scientific and educational (research) values of the geomorphology found in the Gilbert Badlands. Located in Wayne County south of Highway 24, the Gilbert Badlands are about 15 miles west of Hanksville. Located entirely within the Mount Ellen/Blue Hills WSA, the Gilbert Badlands ACEC is subject to management under the IMP. Current management for this ACEC includes the following:

- Closed to OHV use
- Closed to leasing for oil and gas
- Consider withdrawing from mineral entry
- No surface disturbing activities
- Acquire inholdings within the ACEC boundary.

Beaver Wash Canyon ACEC (4,800 acres)

Beaver Wash Canyon contains a unique area identified as a cold riparian ecosystem located in an otherwise desert environment. In 1982, it was noted of Beaver Wash Canyon that, “special management is needed to prevent irreparable damage to the ecological refugia (e.g., an isolated habitat that has preserved suitable environmental conditions for those species adapted to it and is unique in its ecological and geographical position in the region), which could be significantly impaired from certain surface disturbing activities” (BLM 1982). Beaver Wash Canyon is a tributary of the Dirty Devil River, east of Highway 95 and about 13 miles southeast of Hanksville. The majority of the Beaver Wash Canyon ACEC (99 percent) is located within the Dirty Devil WSA and is subject to management under the IMP. Current management for this ACEC includes the following:

- Closed to OHV use
- Unavailable for grazing in the majority of the ACEC
- Closed to oil and gas leasing
- Consider withdrawing from mineral entry
- Acquire inholdings within the ACEC boundary.

3.5.3.2 Potential Areas of Critical Environmental Concern

During scoping for the Richfield RMP, the public nominated 30 areas for designation as ACECs. Of these 30 areas, 4 were primarily within the Price FO (with small acreages within the RFO) and were evaluated for relevance and importance by the Price FO. The remaining 26 areas, totaling 1.6 million acres, were

evaluated for relevance and importance by the RFO staff as part of the planning process. Based on these evaluations, the RFO identified 16 areas totaling approximately 886,810 acres as potential ACECs (see Table 3-32 and Maps 2-43 and 2-44). Information concerning all 26 nominated areas, as well as their evaluations, is summarized in Appendix 1. More detailed information can be found in the *Evaluations of Areas of Critical Environmental Concern* report (2005), which is available for review in the RFO.

Table 3-32. Potential Areas of Critical Environmental Concern

Area	Acreage	County(ies)
Badlands Potential ACEC	88,900	Wayne
Bull Creek Archaeological District Potential ACEC	4,800	Wayne
Dirty Devil/North Wash Potential ACEC	205,300	Wayne and Garfield
Fremont Gorge/Cockscomb Potential ACEC	34,300	Wayne
Henry Mountains Potential ACEC	288,200	Wayne and Garfield
Horseshoe Canyon Potential ACEC	40,900	Wayne
Kingston Canyon Potential ACEC	22,100	Piute
Little Rockies Potential ACEC	49,200	Garfield
Lower Muddy Creek Potential ACEC	16,200	Wayne
Old Woman Front RNA Potential ACEC	330	Sevier
Parker Mountain Potential ACEC	107,900	Wayne
Quitchupah Potential ACEC	180	Sevier
Rainbow Hills Potential ACEC	4,000	Sevier
Sevier Canyon Potential ACEC	8,900	Piute and Sevier
Thousand Lake Bench Potential ACEC	500	Wayne
Special Status Species Potential ACEC	15,100	Wayne, Garfield and Sevier
Total Acreage:	**886,810**	

Badlands Potential ACEC (Includes North and South Caineville Mesas and Gilbert Badlands Existing ACECs) (88,900 acres)

Purpose: The purpose of the Badlands Potential ACEC is to recognize and provide special management for relevant and important scenic, special status plant, natural processes (wind erosion), and riparian and relict vegetation values.

Description: The potential ACEC is located in central Wayne County, east of Capitol Reef National Park, north and south of State Highway 24. Notable geographic features include North Caineville Mesa, South Caineville Mesa, Factory Butte, and the surrounding Mancos Shale badlands. Portions of the Badlands potential ACEC are within the Mount Ellen/Blue Hills WSA and, as such, are subject to management under the IMP.

Area: The potential ACEC is defined by Class A Scenery, and the badlands formations and relict vegetation areas within the nominated and existing ACECs named above. The potential ACEC contains additional acreage beyond that of the existing ACECs and overlaps the northern portion of the Mount Ellen/Blue Hills WSA.

Bull Creek Archaeological District Potential ACEC (4,800 acres)

Purpose: The purpose of the Bull Creek Archaeological District Potential ACEC is to recognize and protect the relevant and important archaeological values in the area.

Description: The Bull Creek Archaeological District is located along Bull Creek in the foothills of the Henry Mountains, directly south of Hanksville. It was listed on the NRHP in 1981.

Area: The potential ACEC boundary is coincident with the Bull Creek Archaeological District boundary for which the relevant and important cultural resource values were identified.

Dirty Devil/North Wash Potential ACEC (includes existing Beaver Wash Canyon ACEC) (205,300 acres)

Purpose: The purpose of the Dirty Devil/North Wash Potential ACEC is to recognize and provide special management for relevant and important scenic, cultural, paleontological, wildlife, and SSS values.

Description: The Dirty Devil River and side canyons are located southeast of Hanksville in Wayne and Garfield counties.

Area: The potential ACEC is defined by Class A Scenery, Mexican spotted owl suitable habitat, and desert bighorn sheep crucial yearlong habitat within the nominated areas. The potential ACEC includes the existing Beaver Wash Canyon ACEC. The potential ACEC overlaps portions of the Dirty Devil, French Spring/Happy Canyon, and Fiddler Butte WSAs; thus management would be governed by the IMP for these areas. The Dirty Devil River and several of its side canyons were determined to be eligible as WSRs.

Fremont Gorge/Cockscomb Potential ACEC (34,300 acres)

Purpose: The purpose of the Fremont Gorge/Cockscomb Potential ACEC is to recognize and provide special management for relevant and important cultural, scenic, riparian, plant, and wildlife resources. Relevant and important values were determined by evaluating the Fish Creek Cove/Cockscomb, Fremont Gorge/Miners Mountain, and Fremont Gateway nominated ACECs.

Description: The potential ACEC is located on public lands east of the Red Gate and west of Capitol Reef National Park in the Torrey-Teasdale-Grover area of central Wayne County.

Area: The potential ACEC is defined by mule deer crucial habitat within the boundary of the 3 nominated ACECs. The potential ACEC contains the entire Fremont Gorge WSA, which is subject to management under the IMP. The potential ACEC also contains the Fremont River in Fremont Gorge, identified by the BLM as an eligible WSR.

Henry Mountains Potential ACEC (288,200 acres)

Purpose: The purpose of the Henry Mountains Potential ACEC is to recognize and provide special management for relevant and important scenic, wildlife (bison and deer), SSS (i.e., Townsend's big-eared bat, ferruginous hawk, burrowing owl, and hole-in-the-rock prairie clover), and ecological values. The No Man's Mesa portion of the ACEC would be designated as an RNA.

Description: Discovered by the Powell Expedition in the 1870s, the Henry Mountains, south of Hanksville, tower over the surrounding desert country.

Area: The potential ACEC is defined by crucial bison habitat, crucial mule deer habitat, and Class A Scenery. Other relevant and important values are included within this boundary. The potential ACEC includes portions of the following nominated ACECs: Bull Creek/Birch Creek, Bullfrog Creek, Granite

Creek, Mount Hillers, No Man's Mesa, Ragged Mountain/Slate Creek, and Upper Sweetwater/Tarantula Mesa. The potential ACEC also overlaps all or parts of 4 WSAs: Mount Hillers, Mount Pennell, Bull Mountain, and Mount Ellen/Blue Hills; management of these lands would be governed by the IMP.

Horseshoe Canyon Potential ACEC (40,900 acres)

Purpose: The purpose of the Horseshoe Canyon Potential ACEC is to recognize and provide special management for relevant and important scenic and cultural values, notably Cowboy Cave. Other relevant and important values include riparian corridors and SSS (e.g. Townsend's big-eared bat).

Description: Horseshoe Canyon is a tributary of the Green River in northeastern Wayne County and is noted for its rock art. Part of the canyon is included within Canyonlands National Park.

Area: The Horseshoe Canyon Potential ACEC is defined by the Class A Scenery within the nominated area. Cultural, riparian, and SSS (e.g. Townsend's big-eared bat) values are included within this boundary. The potential ACEC overlaps portions of the Horseshoe Canyon North and Horseshoe Canyon South WSAs, which would be governed by the IMP.

Kingston Canyon Potential ACEC (22,100 acres)

Purpose: The purpose of the Kingston Canyon potential ACEC is to recognize and provide special management for relevant and important riparian and mule deer habitat in the area.

Description: The potential ACEC encompasses the canyon north and south of the Sevier River between the towns of Kingston and Antimony in Sevier County.

Area: The potential ACEC is defined by the mule deer habitat within the nominated ACEC. The riparian area is included in the mule deer habitat boundary. (**Note:** The riparian area is largely in state and private ownership.)

Little Rockies Potential ACEC (49,200 acres)

Purpose: The purpose of the Little Rockies Potential ACEC is to recognize and provide special management for scenic and wildlife values, notably desert bighorn sheep. Other relevant and important values within the ACEC include SSS (Townsend's big-eared bat and hole-in-the-rock prairie clover), and ecologic values.

Description: The potential ACEC is located in the southwest corner of Garfield County, north of Ticaboo. It overlaps the entire Little Rockies National Natural Landmark and most of the Little Rockies WSA, which would be governed by the IMP.

Area: Class A Scenery defines the ACEC boundary.

Lower Muddy Creek Potential ACEC (16,200 acres)

Purpose: The purpose of the Lower Muddy Creek Potential ACEC is to recognize and provide special management for the relevant and important scenic, riparian, and special status plant values in the area.

Description: The potential ACEC is located along Lower Muddy Creek in north-central Wayne County and south-central Emery County.

Area: Class A Scenery defines the ACEC boundary.

Old Woman Front RNA Potential ACEC (330 acres)

Purpose: The purpose of the Old Woman Front RNA Potential ACEC is to recognize and protect the relevant and important relict vegetation in the area. This RNA ACEC would complement the existing National Forest RNA.

Description: The potential ACEC is located in eastern Sevier County adjacent to the Fishlake National Forest.

Area: The potential ACEC is on public land adjacent to the USFS Old Woman Cove RNA in the Fishlake National Forest.

Parker Mountain Potential ACEC (107,900 acres)

Purpose: The purpose of the Parker Mountain Potential ACEC is to recognize and provide special management for sagebrush-steppe habitat and wildlife values, notably Greater sage-grouse, Utah prairie dog, and pygmy rabbit.

Description: Parker Mountain, also known as the Awapa Plateau, is located in western Wayne County, southwest of the town of Loa.

Area: The potential ACEC includes all of the area that was nominated by the public.

Quitchupah Potential ACEC (180 acres)

Purpose: The purpose of the Quitchupah Potential ACEC is to recognize and provide special management for relevant and important cultural resource and riparian values.

Description: Quitchupah Creek is located in eastern Sevier County. The creek flows off the Fishlake National Forest across public lands managed by the Richfield and Price BLM FOs.

Area: The potential ACEC boundary includes the riparian corridors and associated cultural resource sites and areas that have spiritual value to Native Americans.

Rainbow Hills Potential ACEC (4,000 acres)

Purpose: The purpose of the Rainbow Hills Potential ACEC is to recognize and provide special management for relevant and important mule deer habitat, natural systems, and SSS values in the area.

Description: The Rainbow Hills are located just east of Richfield, in a colorful Arapien shale formation. The potential ACEC nomination includes the shale and other lands adjacent to it.

Area: The potential ACEC boundary is defined by the crucial mule deer range. Plant and natural system values are included within this boundary.

Sevier Canyon Potential ACEC (8,900 acres)

Purpose: The purpose of the Sevier Canyon Potential ACEC is to recognize and provide special management for relevant and important mule deer habitat, riparian, and SSS values in the area.

Description: Sevier Canyon (also known as Marysvale Canyon) is a gorge bordering the Sevier River between the towns of Sevier and Marysvale. Big Rock Candy Mountain (privately owned) is located in the canyon.

Area: The potential ACEC boundary is defined by the mule deer habitat and the riparian corridor on public land along the Sevier River. (**Note:** The riparian area is largely in private ownership.)

Thousand Lake Bench Potential ACEC (500 acres)

Purpose: The purpose of the Thousand Lake Bench Potential ACEC is to recognize and provide special management for relevant and important cultural resources, special status plants, and riparian areas.

Description: The potential ACEC is located in southeastern Sevier County, south of Interstate 70 and east of Thousand Lake Mountain.

Area: The potential ACEC is defined by riparian areas and the locations of cultural resources and special status plants.

Special Status Species Potential ACEC (15,100 acres)

Purpose: The purpose of the Special Status Species Potential ACEC is to recognize and provide special management for isolated and scattered locations of specific plant and wildlife species identified in the evaluations of the various ACEC nominations as relevant and important and not included in other potential ACECs. Species include Winkler cactus, Wright fishhook cactus, last chance townsendia, rabbit valley gilia, Cronquist wild buckwheat, basalt milkvetch, hole-in-the-rock prairie clover, Psoralea globemallow, Jane's globemallow, Townsend's big-eared bat, Allen's big-eared bat, big free-tailed bat, fringed myotis, ferruginous hawk, bald eagle, burrowing owl, long-billed curlew, southwestern willow flycatcher, Greater sage-grouse, bluehead sucker, flannelmouth sucker, leatherside chub, and desert night lizard.

Description: See "Purpose" above.

Area: The Special Status and Endemic Species ACEC is represented by documented locations of the above-listed species. In contrast with the other potential ACECs, this ACEC is composed of many small, discrete areas rather than a large contiguous area.

3.5.4 Other Designations

National Trails

National Historic Trails are "extended trails which follow as closely as possible and practicable the original route or routes of travel of national historical significance" (NPS 2001a). The purpose of the National Historic Trails is "the identification and protection of the historic route and its historic remnants and artifacts for public use and enjoyment" (NPS 2001a).

The Old Spanish National Historic Trail, designated December 4, 2002, by the Old Spanish Trail Recognition Act of 2002, is a 2,700-mile trade route extending from Santa Fe, New Mexico, to Los Angeles, California, passing through the states of Colorado, Utah, Arizona, and Nevada. The trail splits into 2 routes before entering Utah and continues through the State of Utah within the planning area (Map 3-24). The trail corridor is defined topographically based on local land features because no actual trail tread or associated sites have been identified within the decision area.

The Northern Route of the Old Spanish National Historic Trail enters Utah near Moab, splits into two sections at Fremont Junction near I-70, and rejoins near the town of Circleville. From there, the Northern Route continues southwest along the Sevier River and U.S. Highway 89, through the Markagunt Plateau along SR 20 in the decision area, and into the Parowan Valley, where it heads southwest out of Utah to rejoin the Armijo Route south of St. George, Utah.

National Scenic Byways

The National Scenic Byways Program was established under the Intermodal Surface Transportation Efficiency Act of 1991 and reauthorized in 1998 under the Transportation Equity Act for the 21st

Century. Under the program, the U.S. Secretary of Transportation recognizes certain roads as National Scenic Byways or All-American Roads based on their archeological, cultural, historic, natural, recreational, and scenic qualities. All-American Roads must exhibit multiple intrinsic qualities. For a highway to be considered for inclusion within the National Scenic Byways Program, it must provide safe passage for passenger cars year-round, it must be designated a State Scenic Byway, and it must have a current corridor management plan in place. Installation of offsite outdoor advertising (e.g., billboards) is not allowed along byways. There are two national scenic byways in the planning area.

All American Road-Scenic Byway 12 (State Route 12). Scenic Byway 12 takes the visitor to the heart of the American West. This exceptional 124-mile route negotiates an isolated landscape of canyons, plateaus, and valleys ranging from 4,000 to 9,000 feet above sea level. The visitor encounters archaeological, cultural, historical, natural, recreational, and scenic qualities while driving this exhilarating byway. The portion on the RFO is the descent from the forested slopes of Boulder Mountain past scenic views of Miners Mountain, the Cocks Comb ridge, and the Red Gate formation to the junction with Utah State Highway 24 at the town of Torrey (near Capitol Reef National Park).

Trail of the Ancients (State Route 95). This allows the visitor to explore the long and intriguing occupation of the Four Corners region by Native American peoples, traveling through the archaeological heartland of America while crossing the beautiful and diverse landscapes of the Colorado Plateau. The RFO portion begins at Hanksville. The Bicentennial Highway, which is a portion of the Trail of the Ancients, runs south with expansive views of the Burr Desert and the Henry Mountains. The Dirty Devil Scenic overlooks at Burr Point and west Angel Point are accessible from the Highway, as is the Bull Creek Pass Backcountry Byway, the Poison Springs road, and the Hog Springs Picnic area and hiking trail.

Utah Scenic Byways

Highways that have been designated by official state declaration for their scenic, historic, recreational, cultural, archaeological, or natural qualities. The byways are paved roads that are generally safe year-round for passenger cars. Installation of offsite outdoor advertising (e.g., billboards) is not allowed along byways.

Capitol Reef Country Scenic Byway. Highway 24 is the only route through the heart of Capitol Reef National Park and leads to Fishlake National Forest, the sprawling San Rafael Swell, and the colorful Maze District of Canyonlands National Park.

Fishlake Scenic Byway (U-25). Fishlake Scenic Byway U-25 runs through the Fish Lake Basin, which is about 8,850 feet in elevation. In the basin lies a geological wonder, a 2,500 acre lake, formed by the shifting of the Earth‘s faults.

BLM Back Country Byways

The Back Country Byway Program was developed by BLM to complement the National Scenic Byway Program. These byways highlight the spectacular nature of the western landscapes. Back Country Byways vary from narrow, graded roads that are passable only during a few months of the year to two-lane paved highways with year-round access. There is 1 BLM Back Country Byway in the planning area.

Bull Creek Pass National Back Country Byway. This Byway winds for 68 miles through Utah’s Henry Mountains. The view from the route includes colorful canyons, steep cliffs, vast badlands, and rugged alpine mountains. The Byway climbs nearly a mile as it loops through this colorful, vibrant mountain range set between Capitol Reef and Canyonlands National Parks.

Utah Scenic Backways

State Scenic Backways are roads that do not generally meet federal safety standards for safe year-round travel by passenger cars and have been designated by official state declaration for their scenic, historic, and recreational qualities. Utah Scenic Backways often require use of four-wheel drive, and road conditions vary with factors such as season and weather. There are 7 Utah Scenic Backways within the planning area.

Cathedral Valley Scenic Backway. The road starts at I-70, runs south approximately 55 miles to Highway 24 one-half mile west of Caineville past the Limestone Cliffs, through the Red Desert, and the Last Chance Desert. There are striking views of the Mussentuchit badlands, and on the NPS lands, the Temple of the Moon and Sun formations are accessible. The road is a single-lane road with a dirt base. High clearance vehicles are recommended.

Cove Mountain Road. The Cove Mountain Road in the Fishlake National Forest extends from Koosharem on SR-62 north to Glenwood on SR-119. The route is particularly popular because of its spectacular autumn scenery and panoramic views of the Sevier and Koosharem Valleys.

Gooseberry/Fremont Road. Beginning 2 miles north of Fremont on SR-72, this Backway runs 40 miles through the Fishlake National Forest to its end at I-70 in Salina Canyon. The abundance of trees makes this road a popular fall color trek.

Kimberly/Big John Road. The route begins at the city of Junction on US-89. Turning onto SR-153, it continues past Puffer Lake and Elk Meadows. On Fishlake National Forest Road, the Backway turns north to Big John Flat and climbs over the Tushar Mountains. The route continues through the historic Kimberly mining district to the freeway interchange near Fremont Indian State Park at I-70.

Notom Road and Burr Trail Backway. Notom Road runs from Utah Highway 24 at the eastern boundary of Capitol Reef National Park to the junction of Burr Trail Road. The Burr Trail runs south to Bullfrog on Lake Powell. The Notom Road segment parallels the Waterpocket Fold and provides an excellent opportunity to view the magnitude of this colorful and desolate rock spine. East of the Backway are expansive views of the Henry Mountains and Mancos Mesa foothills. The Burr Trail road crosses softly rolling Mancos hills and then follows a deeply incised canyon to Lake Powell.

Posey Lake Road Backway. The Scenic Backway starts at the town of Bicknell and ends at the town of Escalante. The portion of the Scenic Backway managed by the RFO crosses the Awapa Plateau, also known as Parker Mountain. This road is primarily single-lane dirt with gravel in places. It is closed in winter. The lands are sagebrush steppe and home to pronghorn antelope, sage-grouse, pygmy rabbits, as well as prairie dogs.

Thousand Lake Mountain Road. From SR-72, 5 miles north of Fremont, this Backway travels southeast through the Fishlake National Forest to join the Cathedral Valley Scenic Backway. The route provides access to Elkhorn Campground in Fish Lake National Forest and continues back to its point of origin at SR-72.

National Heritage Areas

A “national heritage area” is a place designated by Congress where natural, cultural, historic and recreational resources combine to form a cohesive, nationally distinctive landscape arising from patterns of human activity shaped by geography. These areas tell nationally important stories about the nation and are representative of the national experience through both the physical features that remain and the traditions that have evolved within them. There is 1 national heritage area in the planning area.

National Mormon Pioneer Heritage Area. The national designation recognizes the history, architecture, and culture along "the heritage highway," and includes U.S. Highway 89 from Fairview to Kanab, the Boulder Loop (state highways 12 and 24), the All American Road (Highway 12) and the 6 counties through which the route passes: Sanpete, Sevier, Piute, Wayne, Garfield, and Kane.

3.6 SOCIAL AND ECONOMIC CONDITIONS

The socioeconomic study area includes all of 4 counties (Piute, Sanpete, Sevier, and Wayne) and the eastern portion of Garfield County. (As stated previously, there are also 21,500 acres of Kane County within the RMP planning area. However, because those lands lie entirely within Glen Canyon NRA and no decisions within this RMP will affect those lands, Kane County is not included within the socioeconomic study area.) This section summarizes demographic and economic trend information, including descriptions of the key industries in the 5 county socioeconomic study area that could be affected by BLM management actions. Study area industries most affected by BLM land management policies and programs are (1) production agriculture, in particular cattle grazing and production, (2) mining and oil and gas production, and (3) travel, tourism, and recreation. BLM lands provide areas for activities such as hunting and fishing, hiking, camping or picnicking, traditional natural resource uses (e.g., firewood or pine-nut gathering), and sightseeing.

Although some resources managed by the RFO may be of regional or national interest, this Proposed RMP/Final EIS assumes that RFO management decisions primarily affect the economies of the counties and towns within the 5 counties encompassed by the planning area boundary. This section presents baseline information used to help analyze the socioeconomic impacts of the alternatives considered in this Proposed RMP/Final EIS. More detailed information is provided in the *Baseline Socioeconomic Profile* (BLM 2003b), and this section refers to numerous figures and tables from that document.

3.6.1 Social Background

The *Baseline Socioeconomic Profile* (BLM 2003b) discusses characteristics of the study area in some detail. The 5 counties in the study area are predominantly rural, with large land areas and dispersed populations. The number of persons per square mile ranges from 0.9 in Garfield County to 14.3 in Sanpete County, well below state and national averages.

At least half of the lands in each county within the socioeconomic study area are publicly owned and federally managed. As shown in Table 3-33, the socioeconomic study area comprises more than 80 percent federally managed land, with 12.5 percent in private ownership. Lands managed by the RFO total 2.1 million acres, about 39 percent of the planning area.

Table 3-33. Land Ownership in the Socioeconomic Study Area

Area	Total Population (2000 Census)	Land Area (Sq. Miles)	Persons Per Square Mile	Federally Owned Land	Privately Owned Land
Garfield County	4,735	5,176	0.9	90.0%	5.1%
Piute County	1,435	757	1.9	74.3%	12.7%
Sanpete County	22,763	1,598	14.2	51.7%	42.5%
Sevier County	18,842	1,910	9.9	76.0%	19.1%
Wayne County	2,509	2,464	1.0	85.6%	3.5%
Socioeconomic Study Area	**50,284**	**11,905**	**4.2**	**80.7%**	**12.5%**
Utah	**2,193,000**	**84,583**	**25.9**	**63.9%**	**21.6%**

Note: The Garfield County figures include all land in the socioeconomic study area, not just land in the field office study area.
Source: Utah Division of Travel Development 2004; U.S. Census Bureau 2004.

The socioeconomic study area has sustained human populations for thousands of years. The people of this region, dating back to the origins of the Ute, Paiute, Navajo, and Hopi tribes, and even earlier civilizations such as the Fremont and ancestral Puebloan peoples, maintained very close connections to the land. As these native people lived in or moved through the area, the area's plants and animals provided them with food, medicine, and clothing.

European settlement began in 1849 with the establishment of Manti in Sanpete County. Settlement expanded throughout the area over the next 30 years, with Hanksville in eastern Wayne County being settled in 1882. Settlers supported themselves by irrigating the valleys, running livestock on the rangelands, and, to a lesser extent, mining and lumbering. Settlements were closely tied to locations where water was available for farming and forage available for livestock. The Sevier-Sanpete Valley proved fertile land for farm production, whereas the areas around Parker Mountain and Monroe Mountain and extending through what is now Capitol Reef National Park into the Henry Mountains were used for grazing livestock. Some of the current livestock permittees are heirs of families who have grazed stock on the public land for generations.

As early pioneers labored to make a living with agricultural products, prospectors were exploring the mountains of the area in search of metals and minerals that could be sold for a profit. Specifically, what is now Piute County supported a rich mining boom in the late 1800s. With industrialization and mechanization of agriculture, many of the initial pioneer settlements in the region matured. Throughout the 20th century, the roots of the natural resource–related industries and the persons associated with them became well established in the area. Although today, few families earn their livelihoods solely from these basic industries, agriculture and, to a lesser extent, mining are still an integral part of the social structure of the area. Over time, the connection to public lands has changed from economic to social and traditional. The historical uses of public lands that continue today include hunting, wood gathering, pine-nut collecting, family picnics and other family gatherings, wildlife viewing, Christmas tree cutting, and other traditional activities. These uses provide opportunities for socialization within and between families and other social groups. Large population centers resulting from industrialization and urbanization have heightened social regard for areas without much human development. The socioeconomic study area provides several opportunities for such areas. Use of these areas for outdoor recreation activities has increased over the past 20 years. Major recreational resources in the area, such as the Paiute and Great Western Trails, hiking and canyoneering opportunities in the Dirty Devil region, and bison viewing and hunting in the Henry Mountains attract many people each year to the region. Hunting and fishing opportunities in the socioeconomic study area and in the nearby Fishlake and Manti-LaSal National Forests complement camping, wildlife viewing, and other recreational activities, as people look for a break from urban life. Residents in the socioeconomic study area understand and enjoy the lifestyle that comes with living in the area. The recreation component has created yet another connection to the public lands that is important not only to local residents but also to those who come from other areas in Utah, other states, and other countries to enjoy these natural resources.

A statewide social survey was conducted by Utah State University (USU) in 2007 to assess the ways in which Utah residents use and value public land resources and their views about public lands management. A complete analysis of the results had not been completed as of February 2008. "Public lands." as described in the study, consist of all federal and state managed lands, not just BLM lands. Surveys were mailed to a random sample of residents of all 29 Utah counties. According to the authors, the study and sample sizes are designed to produce results generalizable at the statewide level, with generalization increasingly risky as the sample area diminishes. For example, the data may lose much of their statistical validity at the individual county level. The areas sampled do not necessarily coincide with FO planning area boundaries—that was not the focus of the study. Nonetheless, the study provides current and interesting results not available elsewhere and shows the dependence of Utah residents on public lands for a variety of economic and recreational pursuits. Appendix 17 contains initial summary results for

Garfield, Piute, Sanpete, Sevier, and Wayne counties. Due to the considerations noted above, these results cannot be used as the basis for significant conclusions regarding the relationship of local residents to RFO lands. Thus, the preliminary USU results do not affect the formulation of alternatives in Chapter 2 or the analysis of impacts in Chapter 4.

USU also reviewed the socioeconomic analysis in the RFO DRMP/DEIS in a report under contract to the Six County Association of Governments, which includes Piute, Sanpete, Sevier, and Wayne counties. A section of the report contains summaries of two earlier social surveys, both also conducted by USU for (or included portions of) Wayne and Garfield counties in 2001 and 2004. These two studies show Wayne and Garfield County residents have similar dependence on public lands for a variety of economic and recreational pursuits as found in the results in the 2007 statewide social survey.

Another section of the report summarizes a large body of information on OHV users that provides additional insights into the social significance of OHV use in the socioeconomic study area. It cites several regional studies, not in the socioeconomic study area, that found that riders place great importance on the social and environmental aspects of the OHV experience, OHV activities tend to be more popular with rural residents than those from urban areas, and OHV management concerns vary on topics such as facility development, enforcement, and environmental items. The report also cites national studies that show there has been a large increase in OHV participants and riders over the past 20 years. This body of OHV-related research suggests OHV recreation has become an important way for local residents, and OHV recreationists worldwide, to connect to the public lands.

3.6.1.1 County Perspectives

The following statements, taken from county plans, represent county perspectives on the management of public lands occurring in the 5 county area. County plans are summarized in Appendix 13.

Garfield County: "The county deems it critical that Resource Management Plans provide for range improvements, that current grazing on public lands be preserved, that county water rights be maintained, that public lands timber harvesting be continued, and that mining leases be considered and encouraged" (Garfield County 1998).

Piute County: "It is in the county's best interest that BLM and USFS lands be managed for multiple use and that access is maintained on public lands" (Piute County 1994).

Sanpete County: "The culture and sentiment of Sanpete County residents is such that they…will want input on the management and use of public lands in the county" (Sanpete County 1997).

Sevier County: "Multiple use activities on public lands in Sevier County should continue and should include uses such as agricultural grazing, fishing and hunting, mineral exploration and mining, recreation, wildlife habitat, and timber sales"(Sevier County 1998).

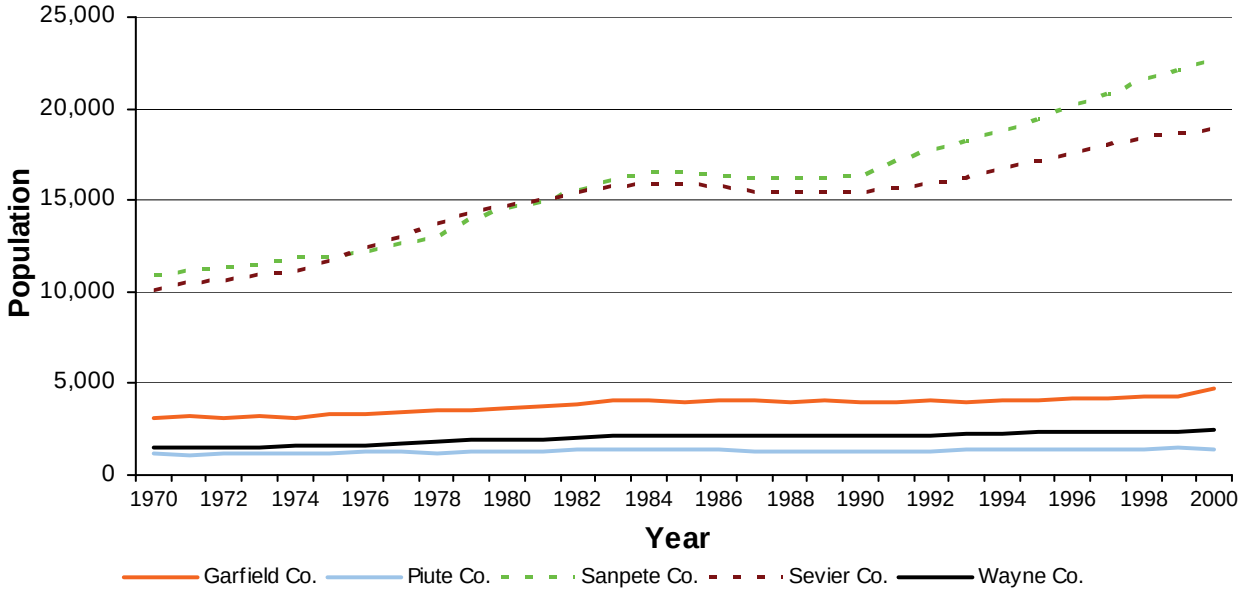
Wayne County: "It is the county's desire that each resource be managed for the optimal economic return, but in ways which do not sacrifice the county's natural aesthetic values" (Wayne County 1994).

3.6.1.2 Population

Approximately 85 percent of the people residing in the socioeconomic study area live in Sanpete and Sevier counties. In contrast, the eastern portion of the socioeconomic study area is very sparsely populated because of its isolation, aridity, and ruggedness.

Population trends for the 5 counties are plotted in Figure 3-20. Population growth in the 5 counties is on an upward trend, although Garfield, Piute, and Wayne counties are growing at a very slow rate. The higher growth rates of Sanpete and Sevier counties have been sustained by increased business opportunities following the construction of I-70, construction of an annex of the Utah State Prison, and expansion of other business related to retail trade.

Figure 3-20. Population Estimates, 1970–2000



Source: BLM 2003b.

The population of the socioeconomic study area increased by almost 8 percent during the 1980s and grew by 24.9 percent in the 1990s. Population growth in the socioeconomic study area lagged significantly behind the state's population growth during the 1980s but outpaced the state's growth during the 1990s (BLM 2003b). The 1980s were marked by a 6.5-percent decline in net migration (i.e., the net result of persons moving in and out of the area). However, the 1990s showed a marked change in this trend. Net migration increased in the socioeconomic study area by nearly 16 percent. These trends are similar to the statewide pattern during both the 1980s and 1990s, with the socioeconomic study area doubling the statewide trends (BLM 2003b).

3.6.2 General Economic Characteristics

All of the counties within the socioeconomic study area, as well as the entire State, showed large increases in the civilian labor force throughout the 1990s. Only Sevier and Garfield counties had percentage increases lower than the State of Utah as a whole, and their increases were more than 20 percent and nearly 19 percent, respectively. The 9-year average annual increase in the civilian labor force for the socioeconomic study area was 2.53 percent, slightly higher than the State's 2.49 percent average. The increases varied within the socioeconomic study area, from a 2.1-percent annual increase in Garfield County to a 3.75-percent increase in Wayne County (BLM 2003b).

Total employment in the socioeconomic study area increased more than 50 percent over the last decade, from 17,202 jobs in 1990 to 25,876 jobs in 2000. This growth rate exceeded the national rate but lagged behind the Utah growth rate.

Throughout the 1990s, unemployment in the socioeconomic study area showed a downward though sometimes unsettled trend. Except for 1993, when the national and socioeconomic study area rates were the same, the unemployment rate for the socioeconomic study area was higher than the national and state rates. All trends show a reversal between 2000 and 2001, with marked increases in the unemployment rate. The yearly average unemployment rate for the years 1990–2001 was 7 percent for the socioeconomic study area, 5.5 percent for the nation, and 3.9 percent for the State of Utah (BLM 2003b).

Total personal income for the socioeconomic study area well exceeded $844 million for 2000, an increase of more than $254 million since 1990. This represents a total growth in real (inflation-adjusted) personal income of more than 43 percent in 10 years (BLM 2003b).

The socioeconomic study area has shown minor changes in how income is earned. Labor income (e.g., wages, salaries, and self-employment income) during 2000 was 63.6 percent of total personal income, whereas investment income was 17.1 percent. These numbers represent small decreases over the last two decades. During the same period, transfer payment income (largely derived from Social Security or other retirement benefits, Medicare and Medicaid benefits, and other income support and assistance) has absorbed the decreases in investment and labor income, growing from 14.6 percent of total personal income in 1980 to 17.5 percent in 1990 and 19.3 percent in 2000 (BLM 2003b). These trends are similar to state and national trends.

Per capita income (in 2002 dollars) in the socioeconomic study area has increased at a much slower rate than statewide per capita income, resulting in an increasingly large disparity between socioeconomic study area and state income levels. In 1990, socioeconomic study area per capita income was 79.3 percent of the per capita income throughout the state. That percentage decreased to 70 percent of state per capita income in 2000. In 2000, the socioeconomic study area per capita income was $16,793, significantly below the national figure ($30,150) and state figure ($23,977).

All 5 counties had a higher poverty rate (percentage of individuals living in households with an income below thresholds defined by the U.S. Census Bureau) than state or national rates in 1989, but in 1999, Sevier County and Garfield County each had a lower poverty rate than the United States. The percentage of individuals within the socioeconomic study area living below the poverty level declined from 17 percent in 1989 to 13 percent in 1999 (BLM 2003b).

3.6.2.1 Employment and Earnings by Industry

Rural areas like the socioeconomic study area are often more dependent on traditional natural resource-based industries, such as mining and agriculture. For example, the socioeconomic study area is more dependent on mining and agriculture jobs than the State of Utah as a whole. Mining and farm employment made up just over 2 percent of Utah's total employment in 2000, whereas those same industries provided for just over 11 percent of jobs in the socioeconomic study area. The mining and agriculture industries are also important as an economic base for the socioeconomic study area because they export their goods outside the region and in turn support ancillary industries such as retail trade, construction, and services (BLM 2003b).

Services, government, and retail trade comprised more than 60 percent of employment in the socioeconomic study area in 2000 (BLM 2003b). Figure 3-21 shows the trends in employment by industry during the last decade. Industries showing the greatest numerical increase in employment from 1990 to 2000 included services (2,744 new jobs), trade (1,751 new jobs), government (1,253 new jobs), and construction (815 new jobs). Industries reporting the slowest growth in the socioeconomic study area included farm and agricultural services and mining, both increasing by 12 percent over the last decade.

Transportation and utilities; construction; and finance, insurance, and real estate (F.I.R.E.) showed significant growth but accounted for relatively small percentages of total employment.

Mineral development, transportation, and utilities continue to provide the highest-paying jobs in the socioeconomic study area, although both industries have experienced a decline in average real earnings per job over the last decade, as shown in Figure 3-22. The government and manufacturing sectors have shown growth in average real earnings per job and now provide the third and fourth highest paying jobs in the area. Farm and agricultural services, trade, and F.I.R.E. reported the lowest earnings per job throughout much of the latter part of the 1990s. Agriculture and mining showed the most volatility in average earnings per job over the course of the decade.

Gross real earnings for all socioeconomic study area industries grew by more than 40 percent from 1990 to 2000. Earnings from government jobs have consistently been higher than all other industries, totaling more than $157 million in 2000 and accounting for nearly 29 percent of all earnings. The service sector has become an integral part of the economy, growing from $59 million and 16 percent of total earnings in 1990 to $104 million and 21 percent of total earnings in 2000. After growing sharply (207 percent) in the 1980s, earnings from jobs in the farm sector dipped (by 36 percent) in the 1990s. The farm sector accounted for $38 million and 7.2 percent of total socioeconomic study area earnings in 2000. Mining also reported a decline in real earnings during the last decade, falling by 6 percent, from $18 million in 1990 to $17 million (3.1 percent of total earnings) in 2000 (BLM 2003b).

3.6.2.2 Government Revenue from Natural Resources

Revenues to the Federal Government

The Federal Government's Minerals Management Service (MMS) collects royalties and rents from leases of federal lands for production of coal, oil, gas, and other leasable minerals. For coal leases issued or readjusted after August 4, 1976, the royalty rate is 8 percent of the value of production for underground mines and 12.5 percent for surface mines. However, there are no surface coal mines in the planning area at this time. Coal leases are offered competitively with a bonus bid in either dollars-per-acre or cents-per-ton; the minimum bid is $100.00 per acre or its equivalent in cents-per-ton. Annual rents on a coal lease are $3.00 per acre. For oil and gas leases issued after December 22, 1987, royalties are 12.5 percent of the amount or value of production. Oil and gas leases are offered competitively with a minimum bonus bid of $2.00 per acre. The rents for an oil and gas lease are $1.50 per acre for the first 5 years and $2.00 per acre for subsequent years. Royalties, bid prices, and rents are collectively referred to as lease revenue. Leases for non-energy solid leasable minerals are also subject to royalties, competitive bidding as required by regulation, and rents, but at this time, there are no non-energy solid mineral leases in the planning area.

Revenues, collected as royalties, rents, and bonus bids on a federal lease, are distributed within the Federal Government and to the State of origin of the revenue. The Federal Government returns 50 percent of the lease revenues to the State of origin of the revenues, and the other 50 percent is variously distributed within the Federal Government, depending on the type of lease, which varies depending on when the lease was issued. In Utah, the revenues distributed to the State flow through the Utah Department of Community and Economic Development to various state funds and other state and local agencies.

The Federal Government also receives bonus bid revenue from minerals underlying former federal lands exchanged with the State of Utah's SITLA in accordance with the Utah School and Lands Exchange Act of 1998 (Public Law 105-335). Only two counties in the state, Carbon and Emery, produce significant mineral lease revenue from exchanged lands. In the socioeconomic study area, only Sevier County has produced any such revenue in FY 2000 through FY 2004—a total of $500.00 in FY 2000. Because this was lease revenue and not bonus bid revenue, all of this revenue went to SITLA (none to the Federal Government).

Table 3-34 provides figures by county for mineral revenue collections by MMS and subsequent disbursements to the State, over the time period FY 2001 through FY 2004.[1] These figures encompass all federal lands in the included counties. Tracing revenues and disbursements to BLM lands in particular was not feasible for this study. Most of the revenue in Table 3-34 is generated in Sevier County as a result of coal production.

The RFO collects fees and other revenues for a variety of uses on BLM lands. These revenue sources include ROW rents, recreation fees, mineral material and vegetative material permit fees, and grazing fees.

Table 3-35 provides figures for the most significant local BLM revenue sources for FY 2002 to FY 2004. The table also indicates how each type of revenue is distributed. Most revenue from sales of land and materials, along with ROW rents, leaves the RFO. Recreation fees are retained. Fifty percent of grazing fees go to the BLM Range Improvement Fund and are returned to the district of origin.

1 *Revenue generated from oil production at the Covenant Field after FY 2004 is not included in the table.*

Table 3-34. Mineral Lease and Bonus Revenues Collected and Disbursed by the Federal Government, State of Utah Fiscal Years 2001–2004

State Fiscal Year and Collections/Disbursements	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County	Study Area Total	State Total
2001

Revenues to State Government

As noted above, the Federal Government, through the MMS, pays the State of Utah 50 percent of the mineral lease and bonus revenues it collects from federal leases in the state. These disbursements are shown in Table 3-36. State exchange lands, as noted above, produce negligible revenue in the socioeconomic study area. Other lands in the socioeconomic study area administered by SITLA may produce mineral revenues, but because these lands are not managed by the BLM, these data were not collected for this study.

The State of Utah collects several taxes and fees that derive from natural resources on both private lands and public lands:

- **Mining Severance Tax.** The tax is 2.6 percent of the taxable value of all metals or metalliferous minerals sold or otherwise disposed of (Utah Code 2004). Every person or business engaged in mining metals or metalliferous minerals must file an annual report with the Utah State Tax Commission. However, the first $50,000 of value is exempt from the tax.
- **Oil and Gas Severance Tax.** The tax is 3 or 5 percent, depending on the value at the well per barrel of oil or per million cubic feet of gas, and 4 percent for natural gas liquids, minus certain credits and reductions (Utah Code 2004). Statewide severance tax revenue totaled $18,893,082 in FY 2002 and $26,745,279 in FY 2003 (Utah State Tax Commission 2003). The state does not report this revenue by county. However, production from the socioeconomic study area for FY 2000 to FY 2003 was limited to Garfield County, averaging about 1.5 percent of state production for oil, and considerably less than 0.001 percent for gas (UDOGM 2004). Thus, oil and gas severance tax revenue to the State from the socioeconomic study area had been negligible. However, in FY 2004, the Covenant Field was discovered in Sevier County, providing a second source of oil production in the socioeconomic study area and a new severance tax revenue stream to the State. Statewide severance tax revenue totaled $71,513,869 in FY 2006 and $65,429,873 in FY 2007 (Utah State Tax Commission 2008). The large increase in severance tax is mainly due to increases in prices of crude oil (Utah State Tax Commission 2008). While oil and gas production in Garfield County slightly declined over the time period FY 2004 to FY 2007 compared with its production levels in FY 2003, Covenant Fields oil production increased dramatically accounting for about 1.1 percent of state production in FY 2004 and reaching 9.3 percent in FY 2007 after peaking at 11.5 percent of state production in FY 2006 (UDOGM 2008). As a result, oil severance tax revenue to the State from the socioeconomic study area has been growing in recent years.
- **Coal Severance Tax.** Utah does not have a state severance tax on coal.
- **Oil and Gas Conservation Fee.** The fee is 0.2 percent of the value at the well (Utah Code 2004). Statewide conservation fee revenue totaled $1,710,219 in FY 2002 and $1,943,755 in FY 2003 (Utah State Tax Commission 2003). The State does not report this revenue by county. Conservation fee revenue to the State from the 5 county area has been negligible in recent years for the same reason noted for the severance tax.
- **Income Taxes.** State income tax rates vary depending on individual or corporate status, type of corporation, taxable income, and other factors. The state requires 5-percent withholding on most mineral production income (Utah Code 2004). The State does not report state income tax revenue derived from income on natural resources in the 5 county area by county, and total revenue from this source cannot be reliably estimated for this study.

Revenues to Local Governments

Most of the federal and state mineral revenue is disbursed to local government. The major means for the disbursements are as follows:

- **UDOT.** Most of Utah's share of federal land mineral lease revenue is deposited in the state Mineral Lease Account. In addition, 39.5 percent of state exchange land mineral lease revenue (minus 3 percent taken by SITLA for administration) is deposited in the Mineral Lease Account. Forty percent of the funds in the Mineral Lease Account are returned to the county of origin through UDOT in proportion to the amount generated by that county.
- **Permanent Community Impact Fund.** A total of 32.5 percent of the revenue in the Mineral Lease Account (plus a remainder after other funds are paid, if available) goes to this special fund set up by the Utah Legislature to award grants and loans to state and local agencies that are socially or economically affected by mineral resource development. In addition, 12.16 percent of exchange lands bonus revenue goes into the Community Impact Fund. The funds are awarded competitively and can be used for planning, construction, and maintenance of public facilities, and provision of public services.
- **Special Service Districts.** Approximately 5 percent of the revenue in the Mineral Lease Account is distributed to 11 counties that are affected by mineral extraction but receive limited funds through UDOT or the Community Impact Fund. These counties include 4 of the 5 counties in the planning area—Garfield, Piute, Sanpete, and Wayne. Each county receives an equal base payment and a portion based on population.

Table 3-36 shows these distributions of mineral lease and bonus revenues by county for recent years.

Table 3-36. Distribution of Mineral Revenues by County, State of Utah Fiscal Years 2001–2004

Data Source	Revenue Source	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County	Study Area Total	State Totals
FY2001								
1	State Distribution to Counties—UDOT	$219,434	$458	$21,138	$2,073,944	$3,556	$2,318,530	$20,609,660

3. Utah Department of Community and Economic Development, Division of Community Development. Legislative Report of the Permanent Community Impact Fund. Reports for FYs 2001–2004 used.

The State of Utah assesses the value of natural resource properties—specifically oil and gas wells, metal mines, coal mines, sand and gravel mines, and nonmetal mines. County treasurers then set and collect taxes from these properties. On public lands, the taxes are based on either—(a) the value of equipment on the site or (b) discounted cash flow from production if the well or mine is producing—whichever is greater. Table 3-37 shows the natural resource property tax amounts collected by the 5 counties in the planning area in 2003 for all lands. A breakdown for BLM lands only is not available. Natural resource properties are a significant source of tax revenue for local government, totaling $1.3 million in the 5 county area in 2003. This represents 5 percent of all property taxes collected by local government (i.e., real and personal property taxes, taxes on utility and natural resource properties, and motor vehicle fees in lieu of taxes). Of this amount, coal mines contributed 70 percent, with nearly $908,144 in taxes paid on coal mines in Sevier County, the third-highest coal-producing county in the State.

Table 3-37. Property Taxes Charged Against Natural Resource Property, 2003

Area	Oil and Gas Extraction	Metal Mines	Coal Mines	Sand and Gravel	Non-Metal Mines	Total Natural Resource Taxes	Total as Percentage of Total Property Taxes
Garfield	$67,885	$53,556	$0	$8,582	$0	$130,023	3.2%
Piute	$0	$7,446	$0	$0	$1,557	$9,003	1.4%
Sanpete	$212	$347	$0	$22,113	$24,165	$46,837	0.5%
Sevier	$0	$477	$908,144	$21,429	$186,229	$1,116,279	11.0%
Wayne	$0	$0	$0	$1,131	$2,499	$3,630	0.3%
Total-Study Area	**$68,097**	**$61,826**	**$908,144**	**$53,255**	**$214,450**	**$1,305,772**	**5.1%**

Source: Utah State Tax Commission 2004

A source of local government revenue directly attributable to the public lands in each of the counties is Payments In Lieu of Taxes (PILT). PILT payments are made by the Federal Government to compensate counties for lost property tax revenue attributed to federal lands, which are not taxable. PILT payments are calculated using a complex formula that considers numerous factors, including acreage of eligible lands; population; and other federal transfers, such as mineral royalties. In FY 2004, PILT payments for all federal lands in the 5 county socioeconomic study area totaled nearly $2.5 million—$113,302 to Piute County, $240,126 to Wayne County, $428,693 to Garfield County, $724,561 to Sanpete County, and $951,083 to Sevier County (USDI 2004). These payments are from all federal lands and therefore cannot be readily attributed to BLM specifically.

Mineral Economics

The mineral industries produce direct and indirect labor earnings that circulate throughout the socioeconomic study area. Mining is a cyclical industry; in the past, mineral development has played a smaller role in the economy of the socioeconomic study area than at the present time. Coal production is at record levels, and there is continuing activity in mining of aggregate, salt, and gypsum. Mining and mining-related employment makes a significant contribution to Sevier County. There are undeveloped mineral resources located throughout the socioeconomic study area. Development of these resources is dependent on economic and other factors within and outside the area.

The main mineral production in the socioeconomic study area is the coal resource within Sevier County. Sevier County is the third-highest producer of coal in Utah and contains the highest-producing coal mine in the State: the SUFCO Mine in Convulsion Canyon. Between 1984 and 2001, coal production rose and

fell from year to year, with a low production value of $67.1 million in 1992 and a high production value of $108.5 million in 2001 (BLM 2003b).

Oil production in the 5 county area (Sevier, Garfield, and Sanpete counties are the only producing counties) generated nearly $5 million in sales in 2001 (BLM 2003b). Gas production, which occurs only in Garfield and Sanpete counties, is associated with the production of oil and generated $33,764 in sales in 2001 (BLM 2003b). Production in Sanpete County is from 1 well that has minor production on an intermittent basis. Production in Garfield County is primarily oil at the Upper Valley field in the western part of the county, outside the planning area. The Covenant Field in the Sevier Valley is the newest discovery of oil in the State, increasing production of oil in the State by more than 11 percent in FY 2006 then slightly decreasing to about 9 percent in FY 2007 (UDOGM, 2008). The discovery of oil at the Covenant Field has increased interest in leasing and exploration in the western part of the planning area. It should be noted that Garfield County's oil and gas production occurs in the western part of the county, outside the planning area, and a large portion of the oil production in the Sevier Valley is located on lands not managed by BLM. Recent drilling in the Sevier Valley area could lead to increased exploration and development within the planning horizon. Increased leasing activity has occurred in the Sevier–Sanpete Valley.

Grazing Economics

The farm sector, which includes grazing on public lands, provided 2,508 jobs in the 5 county area throughout 2000. Although this number is marginally higher than numbers for 1980 and 1990, total employment in the farm sector has dropped from nearly 16 percent in the area in 1980 to nearly 10 percent in 2000 (BLM 2003b). Total earnings in the farm sector were reported as approximately $38.6 million during 2000, or 7.2 percent of total earnings in the 5 county area (BLM 2003b). These figures result in an average yearly income of $15,385 for jobs in the farm sector. Total numbers of cattle in the 5 county area have remained mostly constant over the past 14 years, whereas the number of sheep has declined by more than 35 percent (BLM 2003b).

Within the RFO, the number of permitted AUMs available for livestock grazing has been constant at 109,951 to as far back as at least 1988. An AUM is a standardized measure of the amount of forage necessary for the sustenance of one cow unit or its equivalent (e.g., 5 sheep) for 1 month. Active use, as represented by the number of AUMs licensed (purchased) yearly, has increased from a low of nearly 38,000 in 1990 to a high of nearly 76,600 in 2001. The discrepancy between permitted AUMs and active AUMs can be attributed to the variability of range conditions year to year, fluctuations of prices in the livestock markets, individual permittees taking voluntary nonuse, or combinations of the 3. BLM grazing fees rose to their highest point ($1.98 per AUM) in the mid-1990s but quickly declined and have held steady at or near the base rate of $1.35 per AUM through 2004. The number of livestock operators using BLM lands managed by the RFO has increased steadily, from a low of 120 in 1990 to a high of 148 in 1999 (BLM 2003b).

Calculation of the value of livestock grazing within the RFO is based on the 10-year average of active AUMs (see the livestock grazing section of this chapter). Active AUMs in this period averaged 50,827 for cattle and 9,756 for sheep. The average value of production per AUM in 2003 dollars for the State of Utah is $41.22 for cattle AUMs and $22.93 for sheep AUMs, based on the methodology described in the *Socioeconomic Baseline Report*. Applying these values to the active AUM figures shows that the average value of production for livestock grazing within the RFO in recent years is about $2.1 million per year for cattle and $223,700 for sheep in 2003 dollars (Table 3-38). Combined with information on livestock production across the entire 5 county socioeconomic study area (BLM 2003b, USDA 2004; both updated to 2003 dollars), these data show that 1.5 percent of the $154.2 million 10-year annual average of cash receipts for livestock and livestock products can be attributed to grazing on BLM lands. However, this small figure may not reflect the full significance of grazing on BLM lands; for instance, this grazing could

be critical to certain operators at certain times of the year when other forage or feed is unavailable or expensive.

Table 3-38. Value of Grazing Output on Richfield Field Office Public Lands

Stock Type	Active (Licensed) AUMs*	Estimated Value of Production per AUM (2003$)*	Value of Grazing Output (2003$)
Cattle	50,827	$41.22	$2,095,100
Sheep	9,756	$22.93	$223,700
Total	**60,583**		**$2,318,800**

Notes: 10-year Average 1994–2003
Source: USDA 2004.

Recreation and Tourism Economics

Recreation visitation to the 5 county socioeconomic study area has declined in the past several years, mirroring trends for the state and nation. Figures from the Utah Division of Travel Development (2004) indicate visitation to most area state and national parks peaked in 1999 and in most cases has declined steadily through 2002 (Grand Staircase-Escalante National Monument—minus 41 percent, Yuba State Park—minus 22 percent since peak in 2000, Capitol Reef National Park—minus 19 percent, Glen Canyon NRA—minus 19 percent, Canyonlands National Park—minus 17 percent, Goblin Valley State Park—minus 13 percent, and Palisade State Park—minus 5 percent since peak in 2000). Visitation continued to decrease through 2007 with minus 17 percent in Capitol Reef National Park, 10 percent in Canyonlands National Park, and 26 percent in Glen Canyon NRA. Despite these declines, the recreation and tourism-related sectors have the greatest potential for growth among sectors that use public land resources. Long-term increases in recreation visits are likely a result of projected state and regional population growth and an aging population that will demand increased opportunities for leisure and recreation.

Employment and earnings provided by recreation and tourism are typically within the service and retail sectors, although not all employment and earnings from these sectors can be directly attributed to tourism and recreation. The Utah Division of Travel Development (2004) estimates that there were 2,979 travel and tourism-related jobs in the 5 county area in 2003. According to the Division, 44 percent of total employment in Garfield County in 2003 occurred in tourism-related jobs. Figures for this measure for other counties are as follows: Wayne County—26 percent; Piute County—17 percent; Sevier County—17 percent; and Sanpete County—7 percent. For all 5 counties, the *2007 Economic Report to the Governor* (Utah Governor's Office of Planning and Budget 2007) estimates that 15.4 percent of all jobs (in 2005) were in the leisure and hospitality industries; this is more than double the percentage for Utah as a whole (7.3 percent). The Division estimates that travelers spent a total of $92 million in the 5 county area in 2003, resulting in $1.9 million in tax revenues to local governments.

Recreation participation and visitor days (i.e., 12 hours of participation in any recreational activity) for the lands managed by the RFO for FY 2001 through FY 2004 are detailed in Table 3-23. For the FY ending September 30, 2004, the greatest number of recreationists participated in driving for pleasure (132,195), camping (105,128), picnicking (81,055), hiking/walking/running (66,189), and OHV/ATV use (63,834), whereas the greatest number of visitor days were spent camping (102,144), driving for pleasure (55,034), backpacking (51,610), hiking/walking/running (31,507), and using OHVs (cars/trucks/SUVs) (31,836).

3.6.3 Environmental Justice

"Environmental justice" refers to the fair and equitable treatment of individuals regardless of race ethnicity, or income level, in the development and implementation of environmental management policies and actions. In February 1994, President Clinton issued EO 12898, Federal Actions to Address Environmental Justice in Minority and Low Income Populations. The objective of this EO is to require each federal agency to "make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority and low income populations" (EO 12898, 1994).

Where the impacts of a proposed federal action may involve such populations, an analysis of the potential for disproportionate impacts and meaningful community outreach and public involvement is required.

3.6.3.1 Minority Populations

BLM IM 2002-164, Guidance to Address Environmental Justice in Land Use Plans and Related NEPA Documents, provides policy and guidance for addressing environmental justice in BLM land use planning. IM 2002-164 defines minority persons as "Black/African American, Hispanic, Asian and Pacific Islander, American Indian, Eskimo, Aleut and other non-white persons." Further, IM 2002-164 indicates that an area should be considered to contain a minority population when either the minority population of the affected area exceeds 50 percent, or the percentage of minority population in the affected area is meaningfully greater than the percentage in the general population.

Populations of the 5 counties encompassed within the socioeconomic study area are predominately Caucasian and non-Hispanic. All 5 counties have a larger proportion of Caucasian residents than does the State. Table 3-39 summarizes the population by race and ethnicity in 2004.

Table 3-39. Racial and Ethnic Groups for Richfield Planning Area Counties and Utah (Percentage of Population)

Race or Ethnicity	Garfield County	Piute County	Sevier County	Sanpete County	Wayne County	State of Utah
Caucasian persons	97.4%	98.4%	97.0%	96.6%	99.0%	93.8%
African American persons	0.2%	0.1%	0.3%	0.5%	0.2%	0.9%
American Indian/Alaska Native	1.8%	1.2%	1.8%	1.0%	0.3%	1.3%
Asian persons	0.4%	0.1%	0.3%	0.7%	0.0%	1.9%
Native Hawaiian, or Pacific Islander	0.0%	0.0%	0.1%	0.7%	0.3%	0.7%
Persons reporting two or more races	0.2%	0.1%	0.5%	7.6%	0.2%	1.3%

Race or Ethnicity	Garfield County	Piute County	Sevier County	Sanpete County	Wayne County	State of Utah
Persons of Hispanic or Latino origin	3.3%	5.0%	2.8%	7.6%	2.6%	10.6%
White persons, not Hispanic	94.5%	93.7%	94.5%	89.4%	96.4%	83.8%

Source: U.S. Census Bureau, 2004.
Notes:
1—Detail may not add up to 100% due to rounding.
2—Hispanic breakout is separate because Hispanics can be of any race.
3—Figures for Garfield County represent the entire county, not just the portion within the planning area.

As Table 3-39 shows, the percentage of minority residents does not exceed 50 percent of the total population in any of the 5 counties in the socioeconomic study area. Thus, none of the 5 counties contain a minority population that is meaningfully greater than the general population.

3.6.3.2 Low-Income Populations

With respect to low-income populations, IM 2002-164 indicates that low income populations can be identified according to poverty thresholds published by the U.S. Census Bureau. In addition, the IM notes that "when considering these definitions, it is important to recognize that some low-income and minority populations may comprise transitory users of the public lands and thus not be associated with a particular geographic area."

As shown in Table 3-40, 10 percent of the persons living in Utah had incomes below the poverty level in 2003. Persons with incomes below the poverty level in the counties within the planning area ranged from 10 to 13.8 percent. For the purposes of this analysis, this range was not determined to represent a substantial concentration of persons living in poverty or to be meaningfully greater than the statewide percentage.

Table 3-40. Persons Below the Poverty Level for Richfield Socioeconomic Study Area by County (Percentage of Population, 2003)

Income	Garfield County	Piute County	Sevier County	Sanpete County	Wayne County	State of Utah
Persons below poverty level	10.0%	13.8%	11.8%	13.5%	11.5%	10%

3.7 HEALTH AND SAFETY

3.7.1 Introduction

A major priority in land management for the RFO is ensuring health and human safety on its public lands. The BLM's goals are to effectively manage hazardous materials and safety hazards on the public lands to protect the health and safety of public land users; protect the natural and environmental resources; minimize future hazardous materials and related risks, costs, and liabilities; and to mitigate physical hazards in compliance with all applicable laws, regulations, and policies. The BLM follows its national, state, and local contingency plans as they apply to emergency responses. These plans are also consistent with federal and state laws and regulations.

3.7.2 Hazardous Materials

Hazardous materials are generally defined as a usable product or substance that may cause harm to humans, natural resources, or the environment when spilled, released, or contacted. Hazardous materials are used in everyday activities and may be in the form of a solid, liquid, or gas. Regardless of their physical state, hazardous materials may be toxic, flammable, combustible, reactive, and/or corrosive. These can include, but are not limited to, discarded chemicals, chemical spills, and discarded wastes. Once hazardous materials are disposed of, spilled, or dumped, they are classified as "hazardous waste." Hazardous waste problems within the RFO can result from programs conducted by state and local governments, by local businesses and industries, and/or by illegal dumping of hazardous materials on lands administered by the BLM. In coordination with cooperating agencies, BLM-administered public land sites contaminated with hazardous wastes would be reported, secured, and cleaned up according to applicable federal and state regulations and contingency plans. Parties responsible for contamination would be liable for damage assessment, removal, and restoration costs as prescribed in federal and state regulations. Currently no hazardous waste sites listed on the National Priority List or Superfund Cleanup List exist within the RFO.

3.7.2.1 Potential Hazards

The various hazardous waste generators pose a potential threat to the health and safety of area residents, visitors, and to the physical environment itself. Both commercial and illegal activities can lead to the creation of hazardous waste sites. Spills, illegal dumping, and the discovery of abandoned hazardous materials are likely to occur within the RFO. Contaminants from these sites can pose an imminent threat to public safety and adversely impact the environment by affecting soils, ground water, air, and surface water quality. Potential hazardous waste generators within the RFO include the following: oil and gas drilling operations, natural gas pipelines, mining operations, uranium tailings, storage tanks, landfills, and illegal dumps.

3.7.2.2 Hazardous Materials Management

The RFO Hazardous Materials Program is responsible for hazardous materials handling, storage, transport, and emergency response. Several state and federal mandates, authorities, and handbooks provide the BLM with management guidelines, objectives, and actions pertaining to hazardous materials management. The federal and state prescribed mandates ensure the RFO's compliance with applicable laws and regulations.

3.7.3 Abandoned Mines

The early mining practices within the planning area were subject to minimal safety and environmental regulations. Prior to 1981, the BLM did not regulate surface disturbance related to mining operations and did not have regulations for public safety in association with mining operations. Prior to 1981, mine openings such as shafts, adits, and other access to mine workings, were left open in many cases when the mining operations ceased. These open, abandoned mine workings are a safety and/or health concern to the public because the workings can pose a risk of serious injury and/or toxic threat to humans. In addition, abandoned mines can contribute heavy metals and other contaminants to surface and ground water. This uncontrolled drainage can pose a health risk to humans and be a source of environmental degradation.

The BLM has conducted inventories of abandoned mine sites and some remediation, such as stabilizing sites, closing mine openings, and/or reclaiming mine-related land disturbances within the RFO. In the RFO, the areas most likely to have abandoned mine openings are near Marysvale and the Henry Mountains. In the 1990s, many abandoned mines around Marysvale were closed as part of Abandoned Mined Land projects completed by the State of Utah in cooperation with the BLM; however, many abandoned mine workings are still present. The BLM and the State will continue to inventory and close abandoned sites that are a safety and/or health concern for the public and an environmental concern.

3.7.3.1 Potential Hazards

Abandoned mine sites may pose hazards to human health, the environment, and physical safety. Threats to health and the environment include acid drainage, heavy metal contamination, metal-contaminated tailings impoundments, stored chemicals, and leaking containers. Changes in the chemical composition or soil loss near abandoned mine sites can result in alterations or loss of natural habitat for native wildlife. Abandoned mines may also affect surface and ground water. The impacts to water quality are generally the result of contaminated sediments or metal salts that can affect human health, fisheries, wildlife, and vegetation. Contaminants from tailings impoundments, waste rock piles near abandoned mill sites, and mine workings can become airborne or water transported and become a risk to public health. Releases of hazardous substances from waste piles and acid drainage can affect lands beyond abandoned mine sites.

Open, abandoned, underground mines are unstable; mine adits (horizontal openings at the surface) may collapse, internal supports for levels (passages within the mine) may fail, and mine shafts (vertical openings at the surface) and winzes or raises (vertical connections between mine levels) may be obstructed or unseen. Toxic or lethal air conditions may exist due to low concentration of oxygen or high concentrations of other gases. Exposure to radiation in the mine, particularly radon gas, can be a hazard, especially in abandoned uranium mines in southern Utah.

Abandoned, unreclaimed surface mines can include hazards related to physical safety. Such features could include abandoned unstable highwalls, waste dumps, and other slopes, and can also include equipment.

Water can be a hazard in flooded underground mines; the water may cover and conceal sharp or other hazardous objects and winzes or raises to a lower level. Water at surface mines can also be a hazard and safety risk by concealing objects or concealing abrupt changes in surface.

Hazardous wastes, such as explosive materials and chemicals could be present. Explosive materials can be a safety hazard and can be in a deteriorated, unstable condition. Containers of chemicals can be damaged, in a state of deterioration, or otherwise leaking. Tanks, holding or processing ponds, or other fluid containment structures may have lost integrity and may allow for leakage and seepage into soils,

transport by surface and ground water, or other contamination of the environment and threat to human health. Illegal dumping of hazardous wastes within abandoned mines is also a possibility.

3.7.3.2 Abandoned Mine Management/Reclamation Activities

The BLM has recently developed the Abandoned Mine Lands program (AML) that addresses the environmental and safety hazards associated with AML sites on public lands. Once the sites are identified, they are prioritized and appropriate actions are taken on those historic mine sites that pose health and safety risks. The BLM's priority for reclamation of environmentally contaminated sites is based on risk assessments that address threats to human health and the environment. For example, abandoned mine land sites that affect water quality are usually a greater concern and receive a higher priority for reclamation than those that do not affect water quality. See Chapter 2 for AML program priorities.

Richfield Field Office
Proposed Resource Management Plan & Final Environmental Impact Statement

Volume 2 of 3

August 2008

BUREAU OF LAND MANAGEMENT | UTAH

Richfield Field Office

BLM Mission

To sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations.

BLM-UT-PL-08-004-1610
UT-050-2007-090 EIS
FES 08-25

United States Department of the Interior
BUREAU OF LAND MANAGEMENT

Utah State Office
P.O. Box 45155
Salt Lake City, UT 84145-0155
http://www.blm.gov

IN REPLY REFER TO:

UT-050-1610-012J

Dear Reader:

Enclosed is the Proposed Resource Management Plan (PRMP) and Final Environmental Impact Statement (FEIS) for the Richfield Field Office. The Bureau of Land Management (BLM) prepared the PRMP/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort. This PRMP/FEIS provides a framework for the future management direction and appropriate use of BLM-administered lands and resources located in Sanpete, Sevier, Piute, Wayne, and Garfield counties, Utah. The document contains both land use planning decisions and implementation decisions to guide the BLM's management of the Richfield Field Office. The PRMP/FEIS is open for a 30-day review and protest period beginning the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the *Federal Register*.

This PRMP/FEIS has been developed in accordance with the National Environmental Policy Act of 1969 (NEPA) and the Federal Land Policy and Management Act of 1976 (FLPMA). The PRMP/FEIS is largely based on Alternative B, the Preferred Alternative in the Draft RMP and EIS, which was released in October 2007. This PRMP/FEIS contains the proposed plan and potential impacts of the proposed plan. The alternatives presented in the Draft RMP/EIS are also provided for comparative purposes. Major comments received during the public review period of the Draft RMP/EIS and responses to these comments are provided on an attached CD. To aid the reader, substantive changes made between the Draft RMP/EIS and the PRMP/FEIS are described in Chapter 1 and are detailed in Appendix 20.

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this PRMP and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency publishes the Notice of Availability in the *Federal Register*. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment 1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.). To aid in ensuring the completeness of your protest, a protest check list is attached to this letter (labeled as Attachment 2). If your protest does not include all of the elements outlined in 43 CFR 1610.5-2 the BLM will not respond to your protest.

E-mailed and faxed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular or overnight mail postmarked by the close of the protest period.

Under these conditions, the BLM will consider the e-mailed or faxed protest as an advance copy and will afford it full consideration. If you wish to provide the BLM with such advance notification, please direct faxed protests to the attention of Brenda Hudgens-Williams- BLM protest coordinator at 202-452-5112, and e-mailed protests to: Brenda_Hudgens-Williams@blm.gov.

All protests, including the follow-up letter (if e-mailing or faxing) must be in writing and mailed to the following address:

Regular Mail:	Overnight Mail:
Director (210)	Director (210)
Attention: Brenda Williams	Attention: Brenda Williams
P.O. Box 66538	1620 L Street, N.W., Suite 1075
Washington, D.C. 20035	Washington, D.C. 20036

Before including your address, phone number, e-mail address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior.

Upon resolution of all land use plan protests, the BLM will issue an Approved RMP and Record of Decision (ROD). The Approved RMP and ROD will be mailed or made available electronically to all who participated in the planning process and will be available to all parties through the "Planning" page of the BLM national website (*http://www.blm.gov/planning*), or by mail upon request.

Unlike land use planning decisions, implementation decisions are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM's final approval allowing on-the ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations once the BLM resolves the protests to land use planning decisions and issues an Approved RMP and ROD. Implementation-level decisions in the PRMP/FEIS are indicated by *italic text* and an asterisk (*) in Chapter 2. The Approved RMP and ROD will also clearly identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Selma Sierra
Utah State Director

Attachment 1

[Code of Federal Regulations]
[Title 43, Volume 2]
[Revised as of October 1, 2002]
From the U.S. Government Printing Office via GPO Access
[CITE: 43CFR1610.5-2]

TITLE 43--PUBLIC LANDS: INTERIOR

CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR

PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents

Subpart 1610--Resource Management Planning

Sec. 1610.5-2 Protest procedures.

(a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.

(1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.

(2) The protest shall contain:

(i) The name, mailing address, telephone number and interest of the person filing the protest;

(ii) A statement of the issue or issues being protested;

(iii) A statement of the part or parts of the plan or amendment being protested;

(iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and

(v) A concise statement explaining why the State Director's decision is believed to be wrong.

(3) The Director shall promptly render a decision on the protest. The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested.

(b) The decision of the Director shall be the final decision of the Department of the Interior.

Attachment 2

Resource Management Plan Protest
Critical Item Checklist

The following items *must* be included to constitute a valid protest whether using this optional format, or a narrative letter.
(43 CFR 1610.5-2)

Before including your address, phone number, e-mail address, or other personal identifying information in your **protest**, be advised that your entire **protest**--including your personal identifying information--may be made publicly available at any time. While you can ask us in your **protest** to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so. All submissions from organizations and businesses, and from individuals identifying themselves as representatives or officials of organizations and businesses, will be available for public inspection in their entirety.

Richfield Field Office Planning Area
Proposed Resource Management Plan and Final Environmental Impact Statement

Lead Agency: U.S. Department of the Interior, Bureau of Land Management
Type of Action: Final, Administrative
Jurisdiction: Comprising all of Sanpete, Sevier, Wayne, Piute, and portions of Garfield and Kane Counties, Utah.

Abstract: The Richfield Proposed Resource Management Plan and Final Environmental Impact Statement (PRMP/FEIS) describes and analyzes the Proposed RMP and other alternatives presented in the Draft RMP and EIS (DRMP/DEIS) for the planning and management of public lands and resources administered by the Bureau of Land Management (BLM), Richfield Field Office in Utah. The Proposed RMP is open for a 30-day review and protest period beginning, August 8, 2008, the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability (NOA) of the Final EIS in the Federal Register.

The Proposed RMP was crafted primarily from the Preferred Alternative presented in the DRMP/DEIS (Alternative B) and includes other decisions within the range of alternatives (Alternatives N, A, C, and D) in response to public comments and internal review. The No Action Alternative (Alternative N) reflects current management. The BLM has removed the DRMP/DEIS Alternative B (Preferred Alternative) from the PRMP/FEIS. The other DRMP/DEIS Alternatives (Alternatives N, A, C, and D) and analyses are carried forward in the PRMP/FEIS only for comparative purposes and to correct some mistakes that were identified during the public comment period.

Protest: Protests must be postmarked or received no later than 30 days after publication of the NOA by the EPA in the *Federal Register*. The 30-day protest period (identified above) will not be extended. Refer to the instructions in the dear reader letter for additional information on how to protest. The close of the protest period will be announced in news releases, newsletters, and on the Richfield RMP website at http://www.blm.gov/ut/st/en/fo/richfield/planning.html.

CHAPTER 4—ENVIRONMENTAL CONSEQUENCES

4.1 INTRODUCTION

This chapter describes environmental consequences that may result from implementing each of the four DRMP/DEIS alternatives and the Proposed RMP described in Chapter 2. The purpose of this chapter is to analyze and disclose potential impacts of the federal action on the human environment. An impact is defined as a modification of the existing environment that is brought about by an outside action. The federal action for this Final Environmental Impact Statement (EIS) is the Bureau of Land Management (BLM) land use plan (LUP) revision for the Richfield Field Office (RFO), including the Proposed RMP that will direct future land management within the RFO.

This chapter is organized by resource topic and contains potential impacts that could or would result from the management actions under DRMP/DEIS Alternatives N, A, C, D, and the Proposed RMP. Topics are presented in the same order as in Chapter 3. Discussions of cumulative impacts, irretrievable and irreversible commitment of resources, unavoidable adverse impacts, and the relationship between local short-term and long-term uses concludes this chapter. The baseline data used for determining the potential impacts are the current resource conditions described in Chapter 3.

4.2 ANALYSIS BACKGROUND

4.2.1 Approach to the Analysis

This impact analysis identifies effects that result from a management action and discusses whether those effects would enhance and improve a given resource or would have the potential to degrade a resource. The analysis describes the actions that have direct and immediate effects, as well as those that result in indirect effects. If an activity or action is not addressed in a given section, no impacts are expected or the impact is expected to be negligible, based on existing knowledge.

The detailed impact analyses and conclusions are based on the BLM's knowledge of resources and the planning area, reviews of existing literature, and information provided by experts in the BLM, cooperating agencies, other agencies, interest groups, and concerned citizens. Impacts on resources and resource uses are analyzed and discussed in detail commensurate with resource issues and concerns identified throughout the process. Geographic information system (GIS) analyses and data from field investigations were used to quantify effects when possible. However, in the absence of quantitative data, qualitative information and best professional judgment were used. Acreage calculations and other numbers used in this analysis are approximate and provided for comparison and analytic purposes; they do not necessarily reflect exact, on-the-ground measurements. At times, impacts are described using ranges of potential impacts or in qualitative terms.

Many management actions presented in Chapter 2 would not result in direct, on-the-ground changes. However, the analysis considers impacts that could eventually result in on-the ground changes, by planning for uses on BLM-administered surface estate and federal mineral estate during the life of the Proposed Resource Management Plan (RMP). Impacts could occur from management of both BLM-managed surface estate and federal mineral estate. BLM-administered federal minerals occur beneath surface estate managed by BLM as well as beneath surface estate within state or private jurisdiction (known as split-estate lands). Some BLM management actions may affect only certain resources and alternatives.

4.2.2 Impact Analysis Terminology

This chapter describes the direct, indirect, and cumulative impact of implementing the DRMP/DEIS No Action Alternative and each of the four action alternatives including the Proposed RMP. Direct impacts are caused by an action and occur at the same time and place as the action. Indirect impacts are caused by the action and occur later or farther away but are still reasonably foreseeable. Cumulative impacts are the effects on the environment that result from the incremental impact of the action when added to other past, present, or reasonably foreseeable future actions, regardless of which agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

Impacts are also described as to their context, intensity, and duration. Context relates to environmental circumstances at the location and in the immediate vicinity of the impact, affected interests, and locality. Intensity refers to the severity or extent of the impact or the magnitude of change from existing conditions. Duration refers to the permanence or longevity of the impacts and is depicted as short term or long term. Short-term duration is defined as anticipated to begin and end within the first 5 years after the action is implemented. Long-term duration is defined as lasting more than 5 years.

4.2.3 Assumptions for Analysis

Assumptions regarding level of land use activity, resource condition, and resource response are made in the analysis. Potential impacts and their significance are determined based on these assumptions. The following assumptions were used in the analysis and apply to all DRMP/DEIS alternatives and the Proposed RMP, unless otherwise noted:

- Management actions proposed in the DRMP/DEIS alternatives and the Proposed RMP would apply to BLM-administered public lands and resources only. However, cumulative impacts analyses consider potential actions by individuals or entities other than the BLM.
- The DRMP/DEIS alternatives and the Proposed RMP would be implemented as described in Chapter 2 and would be implemented in accordance with applicable laws, regulations, and standard management guidelines.
- BLM policies, including *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, and Utah's *Standards for Rangeland Health* (SRH) and *Guidelines for Grazing Management* would be applied as appropriate across all DRMP/DEIS alternatives and the Proposed RMP. Rangeland health would be assessed according to the Standards, and the Guidelines would provide strategies to achieve Standards and other desired resource conditions and management objectives.
- Funding would be available to implement the Proposed RMP, as described in Chapter 2.
- Appropriate maintenance would be carried out to maintain the functional capability of all developments (e.g., roads, fences, and other facilities).
- Restrictions or prohibitions on activities in specific areas would protect sensitive resources.
- Mitigation requirements would be applied as described and would prevent or limit direct impacts associated with land use activities or would result in reclamation of the land after the activity has been completed.
- Monitoring would be completed as indicated, and adjustments or revisions would be made as identified.
- The level of activity on BLM-administered land would increase. This expectation is based on historical trends, existing land use agreements such as leases or permits, and statements of interest in land use by individuals and industry organizations.

4.2.4 Availability of Data and Incomplete Information

Council on Environmental Quality (CEQ) regulations for implementing the National Environmental Policy Act (NEPA) require that agencies that evaluate, in an EIS, the reasonably foreseeable significant adverse effects on the human environment identify incomplete or unavailable information, if that information is essential to a reasoned choice among alternatives (43 Code of Federal Regulations [CFR] 1502.22). As is typical in programmatic planning efforts, site-specific data are used to the extent possible but may not be entirely available. The best available information that is pertinent to management actions was used in developing this Proposed RMP. Considerable effort has been taken to acquire and convert resource data into digital format for use in this Proposed RMP. Data was acquired from both BLM and outside sources such as the Utah Division of Wildlife Resources (UDWR). However, certain information was unavailable for use in developing this Proposed RMP. The following types of data were unavailable for all or portions of the planning area:

- Field inventory of soils and water conditions
- Field inventory of wildlife and special status species (SSS) occurrence and condition
- Native American traditional use areas
- Baseline air quality data
- Baseline recreation data
- Surveys for cultural or paleontological resources.

For these resources (and others for which information was unavailable or incomplete), estimates were made regarding the number, type, and significance, based on previous surveys and existing knowledge. Additionally, some impacts cannot be quantified, given the proposed management actions. Where this gap occurs, impacts are projected in qualitative terms. In many situations, subsequent project-level analysis will provide the opportunity to collect and examine the site-specific inventory data required to determine appropriate application of RMP-level guidance. In addition, ongoing inventory efforts by BLM and other agencies within the planning area continue to update and refine information that will be used to implement this Proposed RMP.

4.3 IMPACTS TO PHYSICAL, BIOLOGICAL, AND CULTURAL RESOURCES

4.3.1 Air Resources

This section presents the impacts on air resources from management actions for the resources and resource uses discussed in Chapter 2. Existing conditions concerning air resources are described in Chapter 3.

A qualitative emission comparison approach was selected for the Richfield Proposed RMP analysis of impacts on air quality. This approach was selected because of uncertainties about the number, nature, and specific location of future sources and activities. The emissions calculations were based on the best available engineering data and assumptions; on air, visibility, and emission inventory procedures; and on professional and scientific judgment. However, assumptions were used when specific data or procedures were unavailable. A general statement about National Ambient Air Quality Standards (NAAQS) and Utah Ambient Air Quality Standards can be made for this qualitative analysis. This emission comparison approach is defensible and provides a sound basis for comparing base year air quality emissions with those expected to be produced from the alternatives.

For any future project, BLM will utilize BMPs and site specific mitigation measures, as appropriate and based on site specific conditions, to reduce emissions and comply with local, state, tribal, and federally enforced legal requirements and standards.

Impacts to air quality come primarily from sources outside the planning area, such as regional haze, or from activities on private lands within the planning area (including increased vehicle traffic on highways and roads and industrial development, such as coal-fired power plants) and are thus outside the scope of this Proposed RMP. However, short-term air quality effects could result from fugitive dust and smoke that both directly and indirectly relate to proposed management actions. Main sources of fugitive dust include vehicle and equipment use on unpaved roads, road construction and maintenance activities, and mineral operations. Main sources of smoke are wildland fire use and prescribed fires. Wildfire smoke is outside the scope of this document but will likely remain the largest source of emissions in the next 15 years.

Global Climate Change

The assessment of climate changing pollutant emissions and climate change is in its formative phase; therefore, it is not yet possible to know with confidence the net impact to climate. However, the Intergovernmental Panel on Climate Change (IPCC 2007) recently concluded that "warming of the climate system is unequivocal" and "most of the observed increase in globally average temperatures since the mid-20th century is very likely due to the observed increase in anthropogenic [man-made] greenhouse gas concentrations."

The lack of scientific tools designed to predict climate change on regional or local scales limits the ability to quantify potential future impacts. Currently BLM does not have an established mechanism to accurately predict the effect of resource management-level decisions from this planning effort on global climate change. However, potential impacts to air quality due to climate change are likely to be varied. For example, if global climate change results in a warmer and drier climate, increased particulate matter impacts could occur due to increased wind blown dust from drier and less stable soils. Cool season plant species' spatial ranges are predicted to move north and to higher elevations, and extinction of endemic threatened/endangered plants may be accelerated. Due to loss of habitat, or due to competition from other

species whose ranges may shift northward, the population of some animal species may be reduced. Less snow at lower elevations would be likely to impact the timing and quantity of snowmelt, which, in turn, could impact aquatic species. In the future, as tools for predicting climate changes in a management area improve and/or changes in climate affect resources and necessitate changes in how resources are managed, BLM may be able to re-evaluate decisions made as part of this planning process and adjust management accordingly.

Methods and Assumptions

The emissions inventory was developed for the RFO by using the best available information provided by the RFO about activities on BLM land. The calculations used emissions factors that are accepted and recognized by state and federal regulatory agencies. This analysis selected two time frames to evaluate future emissions. The time frames reflect the current base-year conditions and the long-term impacts. It is assumed that emission growth will always be constant and linear in time. The two inventory time frames are:

- Current emissions (using the year 2007 as a basis)
- 15-year potential emissions for the long term (2022).

The analysis is based on the following assumptions:

- The emission factors recommended by the U.S. Environmental Protection Agency (EPA) (EPA 1995b) would be appropriate for all activities.
- Activity factors would be appropriate for the base year and in future time frames.
- Any anticipated growth in recreation would follow growth trends for Utah during the past 10 years.
- For the qualitative analysis, only emissions from BLM-administered activities would be included.
- Coal production would be stabilized at 13.9 million tons per year. Because underground coal mining does not have specific emissions factors, appropriate factors from surface mining facilities would be used.
- Hydrocarbon emissions, also known as Volatile Organic Compounds (VOC), would include hazardous air pollutants (HAP).

The qualitative analysis used reasonable-but-conservative assumptions for air quality. When there were ranges of activity factors, the upper limit of the range was used to complete calculations for future time frames. BLM would consider performing quantitative dispersion modeling analyses for a project-specific EIS associated with a proposed project.

Visibility is potentially affected by many factors (including emissions), so the qualitative emissions analysis cannot be used to assess potential visibility impacts on nearby Class I areas from activities within the decision area. However, implementation and compliance with the State Implementation Plan, specifically with Section XVII Visibility Protection, is expected to meet visibility goals under all management alternatives. In addition, site-specific EISs and environmental assessments (EA) will include a quantitative visibility analysis, if warranted by the project.

Emissions were calculated for the following activities: conventional oil and coal mining, lands and realty actions, livestock grazing, off-highway vehicle (OHV) use, resource roads use, salable mineral development, and vegetation management. Activities related to cultural resources, paleontology, recreation, transportation and access, OHV use, noxious weed control, wild horses, and fish and wildlife are assumed to be minor sources of air emissions.

Impacts Common to the Proposed RMP and Draft Alternatives

Because this air quality analysis is qualitative, specific impacts of resource activities on air quality cannot be determined. However, it is BLM's judgment that several resource programs (cultural resources, paleontology, forestry and woodlands, wild horses and burros, and fish and wildlife) have only minor or negligible impacts on air quality and will not be discussed further in this analysis. Impacts on air quality would not be anticipated from implementing actions for soil, water, and riparian; visual resources management (VRM); SSS; special designations (Wilderness Study Areas [WSA], Areas of Critical Environmental Concern [ACEC], Wild and Scenic Rivers [WSR]); other special designations; and hazardous materials and waste.

Trucks and heavy equipment (e.g., fire engines, bulldozers) used in vegetation management and manipulation would produce dust when traveling over unpaved roads. Areas receiving vegetation treatment would also add to particulate matter (PM) emissions in the short term until the vegetation recovers sufficiently to stabilize exposed soil.

Wildland and prescribed fires would cause short-term emissions of particulate matter and carbon monoxide (CO) that could spread over large portions of the RFO area, depending on the size of the fire and the wind conditions. In addition, the use of heavy equipment during fire suppression activities would result in particulate emissions (i.e., CO, nitrogen oxides [NO_x], and VOCs).

Livestock grazing and support of grazing activities, which include trucking of livestock into and out of the RFO and checking or constructing livestock range improvements and fences, generate vehicular exhaust emissions and dust. These emissions are produced by both construction activities and regular travel on unpaved and paved roads.

The major recreation impact on air quality would be from OHV use. Use of equipment such as all-terrain vehicles and motorcycles would cause fugitive emissions of PM from traffic on unpaved trails, as well as causing vehicular emissions of PM, CO, NO_x, and VOCs. This impact is expected to peak during weekends and holidays.

The various construction activities authorized under lands and realty for rights-of-way (ROW) (e.g., wind power, communication sites, transmission lines, and pipeline projects) produce PM emissions. The main causes of short-term emissions are soil disturbing activities (e.g., grading, bulldozing, trench digging, traveling on unpaved roads). Exhaust emissions from vehicular travel and emissions from equipment use would also occur.

Air emissions would be produced during all phases of oil development, including exploration, well development, production, and well abandonment and reclamation. During exploration and development, traffic on unpaved and paved roads would cause emissions of PM, CO, NO_x, sulfur dioxide [SO_2], and VOCs. In addition, during well development, drilling activities and construction activities would cause particulate emissions and gaseous emissions as a result of heavy equipment use.

Air emissions would be produced during mining operations and reclamation activities. During mining activities, PM emissions would be produced from overburden removal, blasting, truck loading, bulldozing, grading, storage piles, railroad loading, and travel of heavy equipment over unpaved roads. Gaseous emissions from vehicular exhaust (CO, NO_x, SO_2, and VOCs) would occur from heavy equipment, trains, and vehicular travel.

Base Year

Emissions were calculated for all existing activities and oil well development for the base year (2007) to compare the potential increase in emissions from these activities over a 15-year time horizon (2022). Table 4-1 displays a summary of total emissions that BLM estimates for the base year (2007), broken down by activity. Emissions are calculated on an annual basis (tons per year). The total estimated emissions calculated for 2007 are 1,243 tons per year.

Table 4-1. Base Year Emission Summary

Activity	PM_{10} Tons	$PM_{2.5}$ Tons	NO_x Tons	SO_2 Tons	CO Tons	VOC Tons	HAPs[b] Tons
Oil Well Development and Exploration							
Oil Well Construction	21	5	61	3	36	4	0
Oil Well Operations	0	0	3	0	1	0	0
Oil Well Maintenance	0	0	0	0	0	0	0
Subtotal: Oil Well	**21**	**5**	**64**	**3**	**37**	**4**	**0**
Non-Oil Well Activities							
Coal Mining[a]	111	111	142	16	251	13	1
Lands and Realty	18	3	1	0	0	0	0
Livestock Grazing	5	1	3	0	7	0	0
OHVs[a]	5	5	2	0	353	153	15
Resource Roads	0	0	0	0	0	0	0
Salable Minerals	26	5	0	0	0	0	0

Subtotal: Non-Oil Well Activities	**171**	**125**	**148**	**16**	**611**	**166**	**16**
Grand Total	**192**	**131**	**213**	**19**	**648**	**171**	**16**

[a] $PM_{2.5}$ assumed = PM_{10} for this activity
[b] HAPs assumed = VOCs * 0.1
Note: The values in this table may not sum exactly due to rounding.

Alternative N: No Action

Emissions Calculations

Table 4-2 summarizes total and specific pollutant emissions for Alternative N. These emissions have been estimated for the base-year time frame (2007) and for the 15-year time horizon (2022). Under this alternative, total emissions would increase from the base-year level of 1,243 tons of pollutants per year to 2,250 tons per year by 2022.

Given the low ambient concentrations for some pollutants that exist in the RFO, it is expected that the increase in emissions of CO, NO_x, SO_2, PM_{10}, and $PM_{2.5}$ for Alternative N would not cause concentrations to exceed NAAQS or state ambient air quality standards.

Table 4-2. Alternative N Emissions Summary

Activity	PM_{10} Tons	$PM_{2.5}$ Tons	NO_x Tons	SO_2 Tons	CO Tons	VOC Tons	HAPs[b] Tons
Oil Well Development and Exploration							
Oil Well Construction	44	13	247	6	60	12	1

[a] $PM_{2.5}$ assumed = PM_{10} for this activity
[b] HAPs = assumed = VOCs * 0.1
Note: The values in this table may not sum exactly due to rounding.

Impacts from Air Quality, Soil Resources, and Water Resources

Application of best management practices (BMP) (as listed in Appendix 14) and specific mitigation measures identified in activity-level planning and NEPA-level review would prevent or reduce impacts to air quality. Mitigation during surface-disturbing projects would reduce or eliminate the potential for fugitive dust.

Impacts from Vegetation and Fire and Fuels Management

Wildland fires are a source of air pollutant emissions during combustion of vegetation. The amount of emissions depends on the size and intensity of the fire, the fuel type and moisture content, and the available fuel load. The level of resulting air quality impact depends on the amount and duration of emissions, atmospheric dispersions conditions, and terrain. Under the Proposed RMP and DRMP/DEIS Alternatives, BLM intends to comply with the *Utah Smoke Management Plan* (Utah Department of Air Quality [UDAQ] 2003); implementing actions and mitigations designed to minimize impacts from both wildland fire and prescribed fire.

Alternative N, under the *2005 Land Use Plan Amendment for Fire and Fuels Management*, allows for the full range of fire- and fuels-management actions to achieve ecosystem sustainability. This alternative allows a wide range of vegetation treatment (including mechanical, wildland or prescribed fire, and chemical methods). Some of the treatment methods proposed (e.g., mechanical, chemical) would result in localized and short-term impacts to air quality, including fugitive dust, emission/exhaust from equipment, and chemical fumes. The use of naturally ignited wildland fire and prescribed fire would result in smoke

emissions in the immediate area. In general, these impacts would be minor, although moderate-intensity impacts could be experienced in the immediate vicinity of the treatment areas. The effects on air quality from wildland fires would potentially be of longer duration than those from planned ignitions, depending on the vegetation types involved. Wildland fires would result in greater, direct impacts resulting from smoke and fire abatement efforts. Indirect impacts from wildfires could stem from reduced or eliminated vegetation cover, which would expose the underlying soil to wind and water erosion. Until the area revegetated, that erosion would increase levels of fugitive dust (in the short term) during wind events.

Alternative N's wildland fire use, prescribed fire, and non-fire fuel treatments would minimize smoke and other emissions in the short term but could result in increased fuel build-up, more frequent and larger wildland fires, and greater emissions in the long term, until enough treatment has occurred to bring ecosystems within properly functioning parameters.

Impacts from Travel Management

OHV use impacts air quality by increasing fugitive dust levels, particularly in heavily used areas during times of drought, when soil is drier and the potential to generate dust is greater. Because OHV use contributes to air impairments from fugitive dust and vehicular exhaust emissions, closing areas to cross-country, OHV use—except for authorized administrative and emergency purposes—and limiting travel to designated routes would limit impacts to air quality. OHV emissions would be minimal or nonexistent on 214,000 acres (10%) of the RFO that are closed to motorized vehicle use, although some emissions could be transported from adjacent routes along the boundaries of such areas.

The public would have access to 4,315 miles of unpaved routes in the RFO under Alternative N. Use of these routes would continue to create localized air pollution.

Because of their often rough condition, unimproved routes help keep vehicle speeds down, further reducing the levels of dust. Route-maintenance activities, although minimal and designed solely to correct those conditions that are unsafe or hazardous, would also result in fugitive dust. Watering and the use of chemical dust suppressants would greatly reduce the amount of dust emissions. Closing 65 miles of routes would result in reduced amounts of OHV emissions within the immediate vicinity of the closed routes. Overall impacts to air quality from travel on unpaved routes and maintenance or improvement activities would be localized and short term and could be rated from negligible to minor.

Under Alternative N, motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO. Because the vast majority of routes are unpaved, use of these routes would result in fugitive dust. In addition, 1,636,400 acres (77%) of public lands would be open to motorized cross-country vehicle use under Alternative N. Vehicle use, specifically OHV use, in open areas compared to designated and existing routes has the potential to cause the greatest amount of direct impacts to air quality. These impacts on the overall air quality of the planning area would be negligible to minor, depending upon the level of use, speed of vehicle, and climatic conditions (e.g., amount of wind, humidity, soil moisture). Route-maintenance activities, which would be limited to existing route types, maintenance levels, and frequencies, would also result in emissions. Watering and the use of chemical dust suppressants would greatly reduce the amount of dust emissions from maintenance and on haul roads from gravel pits, mines, and oil drilling sites.

Impacts from Minerals and Energy

Air quality could be impacted during all phases of oil and gas development, including exploration, well development, production, and well abandonment. Equipment used for exploration and development emits PM, CO, NO_x, SO_2, and VOCs, including HAPs. Heavy equipment used in well development, drilling, and construction activities could cause increases in PM and tailpipe emissions. Additionally, vehicle traffic on unpaved roads could cause increases in fugitive dust. Oil and gas production could cause

emissions of PM, CO, NO_x, SO_2, and VOCs, including HAPs. Glycol operations and flashing activities could produce PM, SO_2, NO_x, and VOCs. Additionally, flaring of gases would impact air quality from produced methane, hydrogen sulfide, soot or PM, CO, and NO_x.

Adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize such impacts (Appendices 10 and 14). Closing 459,700 acres to fluids mineral leasing, withdrawing 169,480 acres to mineral entry, and closing 459,700 acres to mineral material disposal would virtually eliminate emissions from mineral management within those areas. Overall impacts to air quality would be minor.

Alternative A

Emissions Calculations

Table 4-3 summarizes total and specific pollutant emissions for Alternative A. The total emissions for this alternative would increase from the base-year level of 1,243 tons per year of pollutants to 2,271 tons per year by 2022. Although the differences are small, Alternative A has the largest increase along with the Proposed RMP. Emissions would also increase relative to the No Action Alternative.

Given the low ambient concentrations that exist in the RFO for some pollutants, it is expected that the increase in emissions of CO, NO_x, SO_2, PM_{10}, and $PM_{2.5}$ for Alternative A would not cause concentrations to exceed NAAQS or state ambient air quality standards.

Table 4-3. Alternative A Emissions Summary

Activity	PM_{10} Tons	$PM_{2.5}$ Tons	NO_x Tons	SO_2 Tons	CO Tons	VOC Tons	HAPs[b] Tons

Note: The values in this table may not sum exactly due to rounding.

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N; although under Alternative A, maximum acreage limits would be set (averaging 73,600 annually for all treatments). Although no maximum treatment acreage limits exist under Alternative N, it is likely that more acres would actually be treated under that alternative in some years (active fire years) because Alternative N generally employs full use of wildland fire and allows for treatment of vegetation to reduce hazardous fuel and to restore ecosystem function. Impacts to air quality under Alternative A would likely result in reduced smoke and other emissions in the short term (compared to Alternative N) but would also likely result in increased fuel build-up, more frequent and larger wildland fires, and increased emissions in the long term.

Impacts from Travel Management

The types of impacts experienced as a result of travel-management decisions under Alternative A would be similar to those described under Alternative N. OHV use, which contributes to air impairments from fugitive dust and exhaust emissions, would continue on public lands within the RFO. Under Alternative A, motorized vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; 449,000 acres (21%) of public lands would be open to cross-country motorized vehicle use; and no areas would be closed to motorized use. The amount of open areas, although greatly reduced compared to Alternative N, would still result in the potential for air quality impacts (e.g., fugitive dust, emissions) from vehicle use in and near such areas. The remainder of the RFO would limit motorized use to designated routes (no areas would be closed). The public would have access to 4,312 miles of unpaved routes (slightly more than Alternative N), which could result in increased impacts to air quality. The BLM would close 68 miles of routes (slightly more than those closed in Alternative N). Impacts from route maintenance or improvement activities would be the same as those described under Alternative N. Overall impacts to air quality would be negligible to minor, depending upon the level of use, speed of vehicle, and climatic conditions (e.g., amount of wind, humidity, soil moisture).

Impacts from Minerals and Energy

Under Alternative A, similar amounts of BLM lands would be closed to fluid mineral leasing (446,900 acres), withdrawn from mineral location (154,700 acres), and closed to mineral material disposal (446, 900 acres) as proposed under Alternative N. Thus, impacts would be similar to those under Alternative A.

Proposed RMP

Emissions Calculations

Table 4-4 summarizes total and specific pollutant emissions for the Proposed RMP. The total emissions for this alternative would increase from the base-year level of 1,243 tons of pollutants per year to 2,271 tons per year by 2022, equivalent to Alternative A. Total emissions would also increase, relative to the No Action Alternative.

Given the low ambient concentrations that exist in the RFO for some pollutants, it is expected that the increase in emissions of CO, NO_x, SO_2, PM_{10}, and $PM_{2.5}$ for the Proposed RMP would not cause concentrations to exceed NAAQS or state ambient air quality standards.

Table 4-4. Proposed RMP Emissions Summary

Activity	PM_{10} Tons	$PM_{2.5}$ Tons	NO_x Tons	SO_2 Tons	CO Tons	VOC Tons	HAPs[b] Tons
Oil Well Development and Exploration							
Oil Well Construction	44	13	247	6	60	12	1
Oil Well Operations	8	2	44	1	10	1	0
Oil Well Maintenance	0	0	0	0	0	0	0
Subtotal: Oil Wells	**52**	**15**	**292**	**7**	**70**	**13**	**1**
Non-Oil Well Activities							
Coal Mining[a]	111	111	142	16	252	13	1
Lands and Realty	18	3	1	0	0	0	0
Livestock Grazing	5	1	3	0	7	0	0
OHVs[a]	11	11	5	-	877	322	32
Resource Roads	0	0	0	0	0	0	0
Salable Minerals	26	5	-	-	-	-	-
Vegetation	26	4	0	0	0	0	0
Subtotal: Non-Oil Well Activities	**198**	**135**	**151**	**16**	**1,136**	**335**	**33**
Grand Total: Proposed RMP Development	**250**	**150**	**443**	**23**	**1,206**	**348**	**35**

[a] $PM_{2.5}$ assumed = PM_{10} for this activity
[b] Assumed = VOCs * 0.1
Note: The values in this table may not sum exactly due to rounding.

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would the same as those described under Alternative A.

Impacts from Travel Management

The types of impacts experienced as a result of travel management decisions under the Proposed RMP would be similar to those described under Alternative N. OHV use, which contributes to air impairments from fugitive dust and exhaust emissions, would continue on public lands within the RFO. Under the Proposed RMP, motorized vehicles would be limited to designated routes on 1,908,210 acres (90%) of the RFO; 9,890 acres (less than 1%) would be open to motorized vehicle use; and 209,900 acres (10%) would be closed to motorized use. Although motorized vehicle use would be limited to designated routes on a similar number of acres as Alternative A, substantially fewer areas would be open to motorized vehicle use under the Proposed RMP; thereby eliminating impacts from vehicle use in open areas. In addition, 10% of the RFO would be closed to motorized use under the Proposed RMP, which would decrease the potential for emissions in those areas.

The public would have access to 4,277 miles of unpaved routes in the RFO. Use of these roads would continue to create localized air pollution. Substantially more miles of routes (280 miles) would be closed under the Proposed RMP than under Alternative N or A, further reducing the level of emissions near these

closed routes. Overall impacts to air quality would be negligible to minor, depending upon the level of use, speed of vehicle, and climatic conditions (e.g., amount of wind, humidity, soil moisture).

Impacts from Minerals and Energy

Under the Proposed RMP, similar amounts of BLM lands would be closed to fluid mineral leasing (447,300 acres), withdrawn from mineral location (176,200 acres), and closed to mineral material disposal (601,800 acres) as proposed under Alternative N, thus resulting in similar impacts.

Alternative C

Emissions Calculations

Table 4-5 summarizes total and specific pollutant emissions for Alternative C. The total emissions for this alternative would increase from the base-year level of 1,243 tons of pollutants per year to 2,254 tons per year by 2022. Although the differences are small, Alternative C includes the third smallest increase found in any of the alternatives. Emissions would also increase slightly relative to the No Action Alternative.

Given the low ambient concentrations that exist in the RFO for some of the pollutants, it is expected that the increase in CO, NO_x, SO_2, PM_{10}, and $PM_{2.5}$ emissions from Alternative C would not cause concentrations to exceed NAAQS or state ambient air quality standards.

Table 4-5. Alternative C Emissions Summary

Activity	PM_{10} Tons	$PM_{2.5}$ Tons	NO_x Tons	SO_2 Tons	CO Tons	VOC Tons	HAPs[b] Tons
Oil Well Development and Exploration							
Oil Well Construction	44	13	247	6	60	12	1
Oil Well Operations	8	2	44	1	10	1	0
Oil Well Maintenance	0	0	0	0	0	0	0
Subtotal: Oil Well	**52**	**15**	**292**	**7**	**70**	**13**	**1**
Non-Oil Well Activities							
Coal Mining[a]	111	111	142	16	252	13	1
Lands and Realty	18	3	1	0	0	0	0
Livestock Grazing	5	1	3	0	7	0	0
OHVs[a]	11	11	5	-	877	322	32
Resource Roads	0	0	0	0	0	0	0
Salable Minerals	26	5	-	-	-	-	-
Vegetation	10	2	0	0	0	0	0
Subtotal: Non-Oil Well Activities	**181**	**133**	**151**	**16**	**1,136**	**335**	**33**
Grand Total: Alternative C Development	**233**	**148**	**443**	**23**	**1,206**	**348**	**34**

[a] $PM_{2.5}$ assumed = PM_{10} for this activity
[b] Assumed = VOCs * 0.1
Note: The values in this table may not sum exactly due to rounding.

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A and the Proposed RMP, although under Alternative C fewer acres would be treated annually (as much as 26,000 annually for all treatments). Thus, impacts to air quality under Alternative C would result in decreased smoke and other emissions in the short term but could result in increased fuel build-up, more frequent and larger wildfires, and increased emissions in the long term, compared to Alternative A and the Proposed RMP.

Impacts from Travel Management

The types of impacts experienced as a result of travel management decisions under Alternative C would be similar to those described under Alternative N. OHV use, which contributes to air impairments from fugitive dust and exhaust emissions, would continue on public lands within the RFO. Under Alternative C, motorized vehicles would be limited to designated routes on 1,445,000 acres (68%) of the RFO; 683,000 acres (32%) would be closed to motorized use; and no areas would be open to motorized vehicle use. With a greater area closed to motor vehicle use and with no area open, overall emissions within the RFO would likely be reduced.

The public would have access to 3,192 miles of unpaved routes in the RFO. Use of these roads would continue to create localized air pollution. More miles of routes (1,188 miles) would be closed compared to Alternatives N, A, or the Proposed RMP, further reducing the level of emissions near these closed routes. Overall impacts to air quality would be negligible to minor, depending upon the level of use, speed of vehicle, and climatic conditions (e.g., amount of wind, humidity, soil moisture).

Impacts from Minerals and Energy

Under Alternative C, more BLM lands would be closed to fluid mineral leasing and to mineral material disposal (586,300 acres) and substantially more areas would be withdrawn from mineral location (331,100 acres)than under Alternative N or A, or the Proposed RMP. The impacts to air quality described for Alternative N would therefore occur over a smaller area. Overall impacts to air quality would be minor.

Alternative D

Emissions Calculations

Table 4-6 summarizes total and specific pollutant emissions for Alternative D. The total emissions for this alternative would increase from the base-year level of 1,243 tons of pollutants per year, to 2,240 tons per year by 2022, the lowest increase found among the alternatives. Emissions would also decrease relative to the No Action Alternative.

Given the low ambient concentrations that exist in the RFO for some pollutants, it is expected that the increase in emissions of CO, NO_x, SO_2, PM_{10}, and $PM_{2.5}$ for the Proposed RMP would not cause concentrations to exceed NAAQS or state ambient air quality standards.

Table 4-6. Alternative D Emissions Summary

Activity	PM_{10} Tons	$PM_{2.5}$ Tons	NO_x Tons	SO_2 Tons	CO Tons	VOC Tons	HAPs[b] Tons
Oil Well Development and Exploration							
Oil Well Construction	43	12	238	6	58	11	1
Oil Well Operations	8	2	44	1	10	1	0
Oil Well Maintenance	0	0	0	0	0	0	0
Subtotal: Oil Well	**51**	**14**	**282**	**7**	**68**	**12**	**1**
Non-Oil Well Activities							
Coal Mining[a]	111	111	142	16	252	13	1
Lands and Realty	18	3	1	0	0	0	0
Livestock Grazing	5	1	3	0	7	0	0
OHVs[a]	11	11	5	-	877	322	32
Resource Roads	0	0	0	0	0	0	0
Salable Minerals	26	5	-	-	-	-	-
Vegetation	10	2	0	0	0	0	0
Subtotal: Non-Oil Well Activities	**181**	**133**	**151**	**16**	**1,136**	**335**	**33**
Grand Total: Alternative D Development	**232**	**147**	**433**	**23**	**1,204**	**348**	**35**

[a] $PM_{2.5}$ assumed = PM_{10} for this activity
[b] Assumed = VOCs * 0.1
Note: The values in this table may not sum exactly due to rounding.

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would the same as those described under Alternative C.

Impacts from Travel Management

The types of impacts experienced as a result of travel management decisions under Alternative D would be similar to those described under Alternative N. OHV use, which contributes to air impairments from fugitive dust and exhaust emissions, would continue on public lands within the RFO. Under Alternative D, motorized vehicles would be limited to designated routes on 972,800 acres (46%) of the RFO; 1,155,200 acres (54%) would be closed to motorized use; and no areas would be open to motorized vehicle use. With a greater area closed to motor vehicle use and with no area open, overall emissions within the RFO would be reduced.

The public would have access to 3,043 miles of unpaved routes in the RFO. Use of these roads would continue to create localized air pollution. More miles of routes (1,242 miles) would be closed under Alternative D than under any of the other alternatives, further reducing the level of emissions near these closed routes. Overall impacts to air quality would be negligible to minor, depending upon the level of use, speed of vehicle, and climatic conditions (e.g., amount of wind, humidity, soil moisture).

Impacts from Minerals and Energy

Under Alternative D, substantially more BLM lands would be closed to fluid mineral leasing, closed to mineral material disposal (1,160,500 acres), and withdrawn from mineral location (903,900 acres), compared to any of the other alternatives. The impacts to air quality described for Alternative N would therefore occur over a much smaller area; overall impacts to air quality would be negligible.

Mitigation Options

BLM would consider mitigation for potential direct project impacts in an EIS for a proposed project. By identifying potential mitigation measures BLM is not prescribing a particular mitigation measure. In addition to specific mitigation measures for projects, the BLM may consider taking an outcome-based approach.

Mitigation may be applied to fugitive dust and NO_x impacts. Fugitive dust refers to any particulate matter that is not deliberately emitted by a well-defined source. Fugitive dust sources typically include windblown dust from unvegetated lands, construction, and unpaved roads. Table 4-7 shows several fugitive dust mitigation options available.

Table 4-7. Effectiveness and Costs of Fugitive Dusk Mitigation Measures (PM_{10})

	Dust Sources					
	Disturbed Areas	Unpaved Roads[1]				
Effectiveness	Level proportional to percentage of land cover	0–50% reduction in uncontrolled dust emissions	33–100% control efficiency	80% for 15 mph[3] 65% for 20 mph[3] 25% for 30 mph[3]	30% reduction	90% reduction
Estimated Cost	Unknown	$4,000/mile	$2,000 to $4,000/mile per year	Unknown	$9,000/mile	$11,000 to $60,000/mile

NO_x emissions are associated with combustion. Table 4-8 shows several potential mitigation measures that could reduce impacts from NO_x emissions. The appropriate level of control will be determined by the State of Utah during the construction permit process.

Table 4-8. Efficiency of Nitrogen Oxides (NO_x) Mitigation Measures

	NO_x Emissions Sources			
	Field Compressors	Sales Compressors	Temporary Diesel Generators[1]	Heavy Equipment
Mitigation Options/Efficiency	Implement BACT Typically results in a NO_x emission rate of about 1 g/bhp-hr	Implement BACT Typically results in a NO_x emission rate of about 1 g/bhp-hr	Register with state; WDEQ regulate as appropriate	Voluntary use of diesel engines

Wyoming is currently registering these generators to determine whether NO_x emissions are significant.

In addition, Table 4-9 shows additional mitigation measures to be considered in the planning area impact assessment. These are general mitigation opportunities that should be considered and applied as appropriate. BLM has no authority to require any application of these measures, although industry is encouraged to implement these measures on its own before they are required by the State of Utah. Advances in technology are likely to offer new mitigation options during the time covered by the RMP. Under NEPA, the planners of individual projects in the planning area must recommend mitigations measures that are appropriate for the projects. The State of Utah, as the permitting authority, will review permit applications and require specific emission control devices and measures. All costs shown in this table are approximate.

Table 4-9. Additional Mitigation Measures with Approximate Costs and Benefits

Type of Mitigation	Approximate Cost	Environmental Cost	Potential Limitations	Environmental Benefit
Selective Catalytic Reduction for Compressor Emissions	$4,000 to $27,000 per NO_x ton-year.	Possible NH_3 releases.	May be cost prohibitive for oil and gas applications.	NO_x emission rate reduced to 0.1 g/hp-hr; decreased visibility impact.
"Green Completions" and Flowback Units	Capital cost ranges from $1,000 to $10,000. Operating cost is $1,000/year. Payback 1–3 years.	Moving equipment to and from well completions. Fugitive dust from trucks.		Saves 100,000 cubic feet of gas per well per year. Reduces flaring emissions by 70–90% at completion.
Electrical Compressors	Capital cost is 40% of gas turbine cost. Operating costs depend on location of transmission lines.	Displaced air emissions from compressor unit to electric power plant.		Moving air emissions away from sensitive PSD Class I areas.
Fugitive Dust Road Treatment	$2,400–$50,000 per mile.	Possible vegetation effects.		20–100% dust control.
Fugitive Dust Administrative Control	$13,000 per well for remote telemetry. A few added work hours per year traveling at enforced speed limits.	Minor/unknown.	Difficult to enforce.	Reduced VMTs with related emission reductions. Slower speeds give 20–50% reductions in dust emissions.
Larger Diameter Sales Pipeline	Capital costs increase with larger pipes. Operating costs decrease with larger pipes.	Larger trench for burying line. Slightly more surface disturbance.	Probably applicable only for large producing operations.	Possibly resulting in lower compressor emissions.
Microhole Drilling	Cost of technology transfer; then potentially less than conventional drilling.	Additional impacts if duplicate drilling is necessary.		Lighter equipment on roads, smaller drilling sites, reduced gaseous emissions during drilling.
Condensate Pipelines	Cost of pipe and installation minus cost of eliminated storage tank and trucking.	Trench for burying line.	The cost may outweigh benefit.	Eliminate emissions from storage vessels; eliminate miles traveled by vacuum trucks.

Type of Mitigation	Approximate Cost	Environmental Cost	Potential Limitations	Environmental Benefit
Wind Farm Electric Generation	4 to 5 cents/kW-hr. Capital costs are large.	Visual impacts, impacts on raptors, maintenance.	Large capital costs required	Reduced power plant emissions. (VOC, NO_x, SO_2, CO, CO_2)
Phased oil and gas Development	Short-term loss of state and federal royalties	Emissions averaged over a longer period.		Peak emissions and impacts are reduced.

The relationship between VOC and nitrogen oxides to form ozone is complex. At this time it is unclear how ozone concentrations would change with VOC and NO_x mitigation. However, Table 4-10 outlines potential VOC mitigation measures.

Table 4-10. VOC Mitigation Measures

Type of Mitigation	Approximate Cost	Environmental Cost	Environmental Benefit
Condenser on Glycol Dehydrator	$1,000 to $10,000	Unknown	95% VOC and HAP reduction.
Activated Carbon Filter on Condensate Storage Tank	$1,000 and up	Energy required to recycle filter.	50–80% VOC reduction.
Stage I Vapor Controls for Condensate Transfer for Truck Loading	$1,000–$3,000	Potential fire risk with improper operation.	90% VOC emission reduction during transfer.

Summary

A qualitative emission comparison approach was selected for the air quality impact analysis. This analysis shows that under all alternatives, there will be little to no impacts. The emissions calculations were based on the best available engineering data and assumptions; on air, visibility, and atmospheric deposition data; on emission inventory procedures; and on professional and scientific judgment. However, where specific data or procedures were not available, assumptions were made. There are limitations associated with this approach. However, given uncertainties about the number, nature, and specific location of future sources and activities, the emission comparison approach is defensible and provides a sound basis for comparing alternatives.

Table 4-11 and Table 4-12 summarize total and specific pollutant emissions for all the alternatives. The range of total emissions is minor (Table 4-11) and the difference between the alternatives is not significant. Please note that the total numbers in Table 4-11 are derived from adding the $PM_{10,}$ $NO_{x,}$ $SO_{2,}$ CO, and VOCs. $PM_{2.5}$ and HAPs are not added in because they are subsets of the PM_{10} and VOC numbers, respectfully. Also note that the totals in Table 4-12 maybe slightly different than the sum of the values in Table 4-2 through Table 4-6 because of rounding.

Except for NO_x, oil development is not a major contributor to air emissions. Non-oil well activities that contribute to emissions include drilling and coal mining, which is the largest contributor to $NO_{x;}$ OHV activities are the largest contributor to CO, VOC, and HAP emissions; and coal mining is the largest

emissions source for PM. It is expected that the increase in CO, NO_x, SO_2, PM_{10}, and $PM_{2.5}$ emissions (Table 4-8) from any alternative would not cause concentrations to exceed NAAQS or state ambient air quality standards.

Table 4-11. Total Emissions for Alternatives (Tons Per Year)

Alternative	2007	2022
No Action Alternative	1,243	2,250
Alternative A	1,243	2,271
Proposed RMP	1,243	2,271
Alternative C	1,243	2,254
Alternative D	1,243	2,240

Note: Totals are all pollutants minus $PM_{2.5}$ and HAPs because $PM_{2.5}$ is a subset of PM_{10} and HAPs are a subset of VOCs.

Table 4-12. Increase in Annual Air Emissions From 2007 Conditions on BLM-Administered Lands Within the RFO Area (Tons Per Year)

Time Frame	PM_{10}	$PM_{2.5}$	NO_x	SO_2	CO	VOC	HAPs
No Action Alternative

4.3.2 Soil Resources

Soils within the RFO are susceptible to impacts from compaction and disturbance, which can lead to accelerated erosion, soil loss, and reduced productivity. Management actions that involve ground-disturbing activities, reducing vegetation cover, trampling, and using vehicles and heavy machinery can result in such impacts, especially in areas in which natural erosion rates are very high because of soil or geologic factors. The greatest impacts to soil come from cross-country vehicle travel, the use of vehicles on poorly constructed routes, mineral operations, and visitor use. The effects of cross-country travel include reduction or disturbance of surface cover (e.g., soil-holding vegetation, litter, rocks), displaced soil particles, increased soil compaction, creation of new flow paths and channels, and increased runoff. Combined, these effects increase soil erosion. The effects of travel on poorly constructed routes are similar to the effects of cross-country travel. Thus, the greater the number of poorly constructed routes that are left open, the greater the impacts through compaction and erosion.

Surface disturbances generally increase soil susceptibility to erosion and compaction, which in turn increases the potential for offsite movement, salinity and sediment delivery to streams, and adverse impacts on soil resources. However, short-term activities that disturb soils may sometimes be necessary to make long-term improvements in soil condition and vegetation cover. Activities such as land treatment are expected to slow erosion rates and improve soil productivity, water-holding capacity, and nutrient cycling capability.

Proposed decisions that allow surface-disturbing activities pose greater risks for adverse impacts to soils and, in some places and situations (e.g., OHV open areas and certain activities allowed under VRM Classes III and IV), to the associated biological crusts. Decisions that restrict surface disturbing activities (e.g., OHV limited and closed areas, restrictions to vegetation and surface disturbance under VRM Classes I and II, mineral withdrawals, special designations) are generally beneficial. Some surface disturbing activities (e.g., hazardous fuels treatments, other vegetation treatments) could have adverse short-term but beneficial long-term impacts. Sometimes soil disturbance could be required for successful restoration treatments (e.g., tillage to alleviate compaction, scarifying to incorporate seed). Although the implementation of SRH, BMPs, and other soil-protection measures to maintain long-term soil productivity is common to all alternatives, the risks of adverse soil impacts because of surface-disturbing activities varies by alternative.

Methods and Assumptions

This analysis was based on the following assumptions:

- Soil resources would be managed to meet Standard 1 of Utah's SRH and *Guidelines for Grazing Management*.
- Substantial surface disturbance to soil, including compaction of soil or loss of vegetative cover, could increase water runoff and downstream sediment loads and could lower soil productivity, thereby degrading water quality, altering channel structure, and affecting overall watershed health.
- The degree of impact attributed to any one disturbance or series of disturbances would be influenced by several factors, including location within the watershed, time and degree of disturbance, existing vegetation, and precipitation.
- An increase of pollutants in surface waters would affect other beneficial uses (e.g., stock watering, irrigation, drinking water supplies).
- Roads and trails would be properly designed.
- Surface disturbances would be restored or mitigated.

Impact analyses and conclusions are based on interdisciplinary team knowledge of resources in the RFO, review of existing literature, and information provided by other agencies. Effects are quantified when possible. Spatial analyses were conducted by using GIS data and analyses. Impacts are described by using ranges of potential impacts or in qualitative terms, if appropriate.

Environmental Consequences

Impacts to soils would likely result from actions proposed under the following resource management programs:

- Air Quality, Soil Resources, and Water Resources
- Vegetation and Fire and Fuels Management
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Wild Horses and Burros
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on soils.

Alternative N: No Action

Impacts from Air Quality, Soil Resources, and Water Resources

Specific stipulations and permit requirements, including reclamation plans to protect soils during and after surface-disturbing activities in the RFO, would minimize the types of impacts described above. These stipulations include the requirement that all surface-disturbing activities are the minimum necessary to complete the task; reclamation plans for road upgrades or realignments; specific soil-stability measures for all surface-disturbing activities and saline soils; and closing and reclaiming temporary roads, facilities, and improvements that are no longer necessary. Impacts would be minor RFO-wide but could be moderate at specific sites. In the long-term, these actions would reduce soil compaction and surface runoff.

Impacts from Vegetation and Fire and Fuels Management

Managing vegetation communities and associations to achieve the SRH could increase organic matter content, structure, and permeability, thereby improving the overall productivity of soils. In addition, Alternative N allows for only limited treatment of vegetation, although a full range of tools (including mechanical, wildland or prescribed fire, and chemical methods) would be available. Restoration and vegetation-treatment projects aimed at improving vegetation health and cover would reduce erosion potential and increase soil productivity. However, mechanical, manual, or chemical treatments could result in soil compaction, some loss in vegetation cover, erosion, and changes in soil chemistry and thus could result in erosion. Restrictions in sensitive areas would help protect fragile soil resources in such habitats. These management actions would improve soil stability and prevent soil loss because of erosion. Initially, vegetation treatments change the vegetation structure and increase local erosion and

sedimentation rates. In the long term, vegetation treatments would improve cover and increase plant diversity, thereby stabilizing soil, improving overall watershed function and condition, and allowing greater infiltration and soil moisture storage. Therefore, impacts would generally be beneficial overall.

Impacts to soils from vegetation management would occur from fire and fuels management. Impacts to soil resources related to wildland fires are complex and involve changes in nutrient cycling, water infiltration and runoff, and erosion potential. Impacts are a function of the severity of the burn, whether the vegetation community is adapted to fire and the fuel condition class of the vegetation community and the condition of soils (e.g., disturbed) before the burn. Alternative N allows for the full range of fire- and fuels-management actions to achieve ecosystem sustainability. High-severity fires remove vegetation and soil surface cover, which drastically increases the potential for wind and water erosion and sedimentation to streams. Off- and on-road use of heavy fire equipment to suppress fires would cause compaction, and chemical retardant could alter soil chemistry. Management prescriptions and post-fire rehabilitation would minimize some of these impacts. Suppressing fires in areas of excessive fuel buildup could minimize, in the short term, high-severity fires and the associated impacts of vegetation loss and erosion. However, continued suppression of wildland fires could result in increased fuel loading and could increase the risk of high-severity wildfires and adverse soil impacts in the long term. Impacts to soils associated with wildfire could be much greater because of a high percentage of vegetative cover loss and intense deep heating, resulting in soil sterilization and the creation of hydrophobic surface layers.

Impacts from Visual Resources

In general, VRM class designations would limit or allow surface-disturbing activities in certain areas, thereby affecting soil resources. VRM Classes I and II would be aimed at greater retention of existing landscape character than Classes III or IV would be. Under Alternative N, none of the lands managed by the RFO are classified as VRM Class I; 529,500 acres (25%) would be managed as VRM Class II; 569,000 acres (27%) would be managed as VRM Class III; and 1,029,500 acres (48%) would be managed as VRM Class IV. Managing areas as VRM Class II would reduce surface disturbance and would retain existing vegetation, thereby reducing soil erosion. Areas managed as VRM Class III or IV (75% of the RFO under Alternative N) would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which drastically increases the potential for wind and water erosion and sedimentation to streams.

Impacts from Special Status Species

Alternative N (and all the other alternatives) prohibits actions that destroy, adversely modify, or fragment federally listed species habitat; proposes habitat improvements for SSS; generally retains SSS habitat in federal ownership; and considers SSS habitat in all wildland fire-suppression efforts. The combined actions would have beneficial impacts on soils by helping to minimize surface disturbance, thereby maintaining soil productivity and limiting erosion. Springtime seasonal restrictions placed on surface-disturbing activities (e.g., to protect Greater sage-grouse breeding habitat) could also minimize compaction by reducing equipment operations when soils are moist and most susceptible.

Impacts from Fish and Wildlife

Proposed decisions for fish and wildlife, such as avoiding habitat fragmentation, reducing road densities, and restricting surface disturbance or surface occupancy within 500 feet of riparian areas, would have beneficial impacts on soils by reducing erosion, compaction, or vegetation loss within the riparian buffer zone. These management actions would improve soil stability and prevent soil loss caused by erosion.

Alternative N also proposes habitat treatments to meet terrestrial, aquatic, and riparian habitat objectives. These vegetation treatments would initially change the vegetation structure and would increase local

erosion and sedimentation rates. However, in the long term, vegetation treatments would improve cover and increase plant diversity, thereby stabilizing soil, improving overall watershed function and condition, and allowing greater infiltration and soil moisture storage. Therefore, impacts would be beneficial overall.

Impacts from Wild Horses and Burros

In general, the greater the number of burros, the greater the possibility of adverse impacts on soil resources because of trampling, compaction, and reduced vegetation cover. Under Alternative N, 100 animal unit months (AUM) are allocated to burros in the Canyonlands Herd Management Area (HMA), although no appropriate management level (AML) is established. These numbers are greater than Alternative A (which establishes an AML of zero and allocates no AUMs) but less than the Proposed RMP, C, or D (which establish a herd size of between 120 to 200 head). Impacts to soils under Alternative N would be minimal because of the small herd size.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for soils.

Impacts from Forestry and Woodland Products

Conducting commercial timber harvests on a case-by-case basis west of Capitol Reef National Park could result in localized surface disturbance, soil compaction, and changes in vegetation community composition and structure. Soil compaction would reduce water infiltration and could reduce plant growth and nutrient cycling. Indirectly, this could increase sediment loading in streams and could reduce riparian-wetland function. Implementing mitigation measures would reduce the long-term effects of these impacts. Removal of dead and down material would reduce large-size fuels and could alter the physical properties of soil resources.

Alternative N allows for harvesting of forest and woodland products across most of the RFO (i.e., all areas, outside of WSAs, on a case-by-case basis). Harvesting of forest and woodland products would have localized minor-to-moderate impacts on soils from vehicle use to access the harvesting site and from loss of vegetative cover. Indirect effects would include reduced soil infiltration, increased erosion and sedimentation, increased soil surface temperatures, and short- or long-term changes in species composition or community structure. However, removal of pinyon and juniper trees from areas in which they have invaded or areas in which canopy densities have increased would result in reduced amounts of bare ground and increased litter at the soil surface. Because pinyon pine and juniper vigorously compete with other plants for available soil water, their removal allows for regrowth of grasses and shrubs in the understory vegetation. This regrowth provides a protective vegetative cover for the soil surface, resulting in decreased erosion.

Impacts from Livestock Grazing

Under Alternative N, 138,952 acres would continue to be unavailable to livestock grazing, while 1,989,048 acres would continue to be available to grazing. Livestock grazing can increase soil compaction in trailing, watering, and mineral-supplement areas. However, livestock grazing within the RFO would be managed in keeping with applicable laws and regulations and with the *Fundamentals of Rangeland Health* and the *Standards and Guidelines for Grazing Administration*. Adhering to these standards and guidelines would minimize impacts from livestock grazing by maintaining plant vigor and by increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, and productivity. This maintenance or improvement would ensure that upland soils would exhibit infiltration, permeability, and erosion rates that are appropriate to soil type, climate, and landform. Impacts would therefore be minor area-wide but potentially moderate in specific areas in which livestock tend to congregate.

Impacts from Recreation

Recreational activities have site-specific impacts to soil resources near frequent and high-use areas such as campgrounds, parking lots, trailheads, and other recreation-related use areas. Long-duration trail use (e.g., walking, equestrian, OHV, mountain biking), especially during wet periods, could result in soil compaction and loss of vegetation cover, and could lead indirectly to increased erosion and loss of soil resources. Large-group recreation events and camping could compact soils, which could change infiltration rates and the distribution of water in soil and could increase surface runoff. Increased runoff and soil erosion would lower the functioning condition of the riparian area. These impacts would be site-specific and localized (Hammitt and Cole 1998).

Visitor use is expected to increase throughout the RFO. Under Alternative N, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore Field Office [FO]) is identified and managed as an extensive recreation management area (ERMA). Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions that would affect soils identified. Thus, intensively used recreation sites (such as near Otter Creek, Big Rock, Factory Butte, or Dirty Devil/Robbers Roost) would experience more intense, regular impacts to soils. Impacts to soils in these areas occur from OHV use and use by large numbers of visitors in a limited space. These activities result in loss of vegetation cover and soil compaction, leading to increased wind and water erosion. These impacts to soils would continue under Alternative N or might increase as visitor use increases.

Impacts from Travel Management

Generally, the more area open to OHV use, the greater the potential for adverse impacts to soil resources from trampling of vegetation and biological soil crusts, which leads to compaction and accelerated erosion. Limiting travel to designated routes confines the impacts to areas already disturbed or hardened for vehicle use. Under Alternative N, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing potential impacts to soil over a large portion of the RFO; motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO; and 214,000 acres (10%) of the RFO would be closed to motorized vehicle use. The public would have access to 4,315 miles of unpaved routes in the RFO. Use of these routes would continue to create the potential for soils impacts in the immediate vicinity of these routes.

Among the alternatives, Alternative N would have the greatest adverse impacts to soils because of the large amount of lands open to cross-country motorized use.

Impacts from Lands and Realty

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws would provide protection to soils from the mining exploration and development impacts that could cause soil compaction and erosion. Alternative N proposes a total of 169,480 acres of withdrawals. Mining disturbance and associated soil-resource impacts would therefore not occur in these areas.

Retaining habitat for listed and candidate species in federal ownership would continue to provide protection to soils in these areas. Identifying 760 acres as available for sale, compared with retaining the land in federal ownership, could make these lands susceptible to increased impacts to soils because the BLM would implement BMPs for the protection of soils in any actions it authorizes.

Any new land use authorizations (e.g., ROWs, permits, leases, easements) could impact soils through compaction and vegetation removal, which could lead to erosion. Under Alternative N, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (no surface occupancy [NSO]) (22,600 acres) would be managed as ROW avoidance areas. Exceptions would be granted only when the proposed

authorization would not create substantial surface disturbance or would create only temporary impacts. Thus, impacts to soils in these avoidance areas would be negligible-to-minor and localized.

Impacts from Minerals and Energy

Disturbance of soils associated with mineral resource development would contribute to adverse impacts to soils, including loss of vegetative cover and soil productivity. In particular, noxious weed infestation resulting from disturbance of reclamation-limited soils would impact soil productivity. Biological soil crusts would potentially be crushed during surface disturbance and would no longer be protected from wind or water erosion.

The acreage in each leasing category would quantify impacts to soils, in terms of acres of surface disturbance. The categories, listed from greatest to least amount of surface disturbance, are as follows: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (timing limitation [TL], controlled surface use [CSU]), open to leasing subject to major constraints [NSO], and closed to leasing. Generally, areas that are closed to leasing or open to leasing subject to major constraints (NSO) would experience little or no surface disturbance caused by minerals development; thus, negligible or no adverse impacts to soils would occur. Areas open to leasing subject to standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) would experience short- and long-term impacts to soils from surface disturbance associated with minerals development. These short- and long-term adverse impacts would include destruction of biological soil crusts, erosion and subsequent sedimentation of surface waters, changes in surface hydrology and infiltration, and possible alteration of soil chemistry or productivity by noxious weeds.

Under Alternative N, 459,700 acres would be closed to leasing; 22,600 acres would be open to leasing subject to major constraints (NSO); and 1,645,700 acres would be open to leasing subject to standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). Closing or withdrawing areas from mineral operations would prevent impacts to soils within those areas. In addition, adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to soils.

Impacts from Special Designations

Wilderness Study Areas

Managing WSAs pursuant to the Interim Management Policy (IMP) for Lands Under Wilderness Review would prevent most ground-disturbing activities. This management would result in protection for soil resources.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect soil by preventing ground-disturbing activities in the river corridors. All eligible segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative N. This management would benefit soils by limiting ground disturbance in these areas.

Areas of Critical Environmental Concern

Although ACEC designation alone does not necessarily provide protection for soils, management actions included in ACECs are often more restrictive, thus indirectly providing protection. ACEC-associated protections that would affect soils include managing oil and gas leasing as closed to leasing or open to leasing subject to major constraints (NSO), implementing more restrictive VRM designations, restricting livestock grazing,; and implementing travel limitations. Alternative N continues the designation of four

ACECs (14,780 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would involve closing the ACECs to OHV use; managing the ACECs as closed to leasing or as open to leasing subject to major constraints (NSO), depending on the ACEC; making three of the four ACECs unavailable for livestock grazing; and acquiring inholdings. These restrictions would reduce surface-disturbing activities within the four ACECs, thus protecting soil resources.

Alternative A

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N, although under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually for all treatments). No target (maximum or minimum) treatment acreage limits would be set under Alternative N. It is therefore likely that in some years, fewer acres would be treated under Alternative N; however, in other years (when there are numerous wildland fires) more acres could be treated because the 2005 Land Use Plan Amendment for Fire and Fuels Management allows the full range of fire and fuels management actions to achieve ecosystem sustainability.

Full suppression of wildland fires is not mandated under Alternative A. Thus, impacts to soils under Alternative A would likely result in decreased short-term impacts (altered vegetation structure and increased local erosion and sedimentation rates) compared to Alternative N. However, continued suppression of wildland fires could result in increased fuel loading and increase the risk of high-severity wildfires and adverse soil impacts in the long term. Impacts to soils associated with wildfire would then be much greater in the long term because of a high percentage of vegetative cover loss and intense deep heating from high-intensity fires, resulting in soil sterilization and creation of hydrophobic surface layers.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative A, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 0 acres would be designated as VRM Class II; 392,800 acres (18%) would be designated as VRM Class III; and 1,288,300 acres (61%) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically increase the potential for wind and water erosion and sedimentation to streams. Thus, Alternative A has the greatest potential to impact soils.

Impacts from Special Status Species

The types of impacts experienced as a result of SSS management would be similar to those described under Alternative N. However, Alternative A includes additional strategies (including employing directional drilling for oil and gas, closing and reclaiming roads, mitigating the effects of proposed projects that have the potential to cause long-term or permanent impacts or losses of habitat, and using species-specific buffers for surface-disturbing activities) to avoid or reduce fragmenting habitat. The combined actions would have beneficial impacts on soils by helping to maintain soil productivity and limit erosion. Springtime seasonal restrictions placed on surface-disturbing activities (e.g., to protect Greater sage-grouse breeding habitat) could also minimize compaction by reducing equipment operations when soils are moist and most susceptible.

Impacts from Fish and Wildlife

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under Alternative N. However, Alternative A proposes restricting surface disturbance or surface occupancy within 330 feet of riparian areas (versus 500 feet for Alternative N) and includes fewer restrictions on OHV use in crucial wildlife habitats. These management actions would increase the potential for soils impacts under this alternative.

Impacts from Wild Horses and Burros

In general, the greater the number of burros, the greater the possibility of adverse impacts on soil resources. Under Alternative A, no AUMs would be allocated to burros in the Canyonlands HMA, and the AML would be set at zero. Keeping the AML at zero would eliminate impacts that trampling, compaction, and reduced vegetation cover could cause to soils.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative A, resulting in no additional protection for soils.

Impacts from Forestry and Woodland Products

Alternative A allows for harvesting of forest and woodland products across most of the RFO (i.e., all areas, outside of WSAs) where sustainable and compatible with restoring, maintaining, or improving forest health. The types of impacts would be similar to those described for Alternative N. However, Alternative A includes objectives to emphasize woodland health, one component of which is maximizing soil productivity and minimizing soil loss. These objectives would be emphasized and addressed for harvesting and mitigation included as appropriate to reduce the potential for soil compaction and erosion. Thus, management of forestry and woodland products under Alternative A would have less potential to adversely impact soils than under Alternative N and may result in beneficial impacts by improving woodland health.

Impacts from Livestock Grazing

Under Alternative A, 102,002 acres would be unavailable to livestock grazing and 2,025,998 acres would be available for grazing. Livestock grazing can increase soil compaction in trailing, watering, and mineral-supplement areas. However, livestock grazing within the RFO would be managed in keeping with applicable laws and regulations, with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, and with BLM's riparian policy. Adhering to these statewide standards, guidelines, and policy would minimize impacts from livestock grazing by maintaining plant vigor and increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, and productivity. This would ensure that upland soils would exhibit infiltration, permeability, and erosion rates that are appropriate to soil type, climate, and landform. Impacts would therefore be minor area-wide, but potentially moderate in specific areas in which livestock tend to congregate.

Impacts from Recreation

Under Alternative A, five Special Recreation Management Areas (SRMA) (514,500 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Limiting OHV use in the Otter Creek Reservoir SRMA to designated routes would maintain existing soil, water, and riparian resource conditions by concentrating impacts to already disturbed areas and by reducing the extent of soil compaction. Maintaining the existing condition of riparian-wetland areas would reduce soil erosion. Reducing the extent of soil compaction would indirectly maintain existing infiltration and soil-water distribution patterns.

The construction of recreation facilities in the Big Rock SRMA could have localized short-term adverse impacts, including soil compaction, reduced infiltration, and changes in surface hydrology; long-term impacts to soils would be beneficial by concentrating use areas and thus limiting the extent of soil disturbance. Managing the Dirty Devil/Robbers Roost SRMA (290,000 acres) for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for soil disturbance from recreation. Limiting OHV recreation use in the Dirty Devil/Robbers Roost SRMA to designated routes would reduce potential surface disturbance and localized soil erosion. Managing the Sahara Sands SRMA (12,300 acres) for a roaded natural recreational opportunity and the development of facilities would have site-specific impacts, including soil compaction, changes in surface hydrology, and increased runoff. Managing the Factory Butte SRMA (199,700 acres) for a motorized recreational opportunity and allowing moderate-to-extensive landscape modification would have potentially major impacts, including vegetation removal, soil compaction, changes in surface hydrology, and increased runoff over a relatively large area.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative A designates 449,000 acres (21%) of the RFO as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; and 0 acres would be closed to motorized vehicle use. The amount of open areas, although greatly reduced compared to Alternative N, would still result in impacts to soil from vehicle use in those areas. The remainder of the RFO would have motorized use limited to designated routes: the public would have access to 4,312 miles of unpaved routes while 68 miles of routes would be closed (both of which are essentially the same as Alternative N). No areas would be closed to motorized use, with no accompanying benefits to soils.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty management would be similar to those described under Alternative N, although impacts to soils could occur over a larger area because of fewer acres proposed for withdrawal (154,700 acres under Alternative A), more acres proposed for disposal (13,400 acres), and fewer ROW avoidance areas (446,900 acres closed to oil and gas leasing). Thus, impacts to soils from surface disturbing activities (such as compaction and vegetation removal, which could lead to erosion) would be greater under Alternative A than under Alternative N.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. Development of oil and gas resources could affect soils because of the surface disturbances associated with such development. However, adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to soils. Closing or withdrawing areas from mineral operations would prevent impacts to soils within those areas. (See the Impacts from Lands and Realty section for a discussion of withdrawals.) Alternative A proposes fewer acres of mineral withdrawals (154,700 acres), which would provide less protection to soils, compared to Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible river segments would be recommended as suitable, and no special management to protect the outstandingly remarkable values of these rivers would be provided. Thus,

impacts to soils from surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion) could occur in the river corridors. Potential impacts to soils from WSR decisions could be greatest under this alternative. However, because most of the eligible river segments (98 of the 135 total miles) are within WSAs, none of the previously described ground-disturbing activities would occur in those river corridors.

Areas of Critical Environmental Concern

Under Alternative A, no areas would be designated as ACECs. Providing no special management prescriptions would allow surface-disturbing activities within those areas, which could result in impacts to soils.

Proposed RMP

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same for all alternatives (as described in Alternative N).

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative A.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under the Proposed RMP, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 249,800 acres (12%) would be designated as VRM Class II; 393,100 acres (18%) would be designated as VRM Class III; and 1,038,200 acres (49%) would be designated as VRM Class IV. Although the majority of the RFO would be designated as VRM Class III or IV (which could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying surface disturbance and potential for wind and water erosion and sedimentation to streams), less of the RFO would be designated in these VRM classes than in Alternatives N or A, resulting in less potential impacts to soils, compared to those alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts to soils under the Proposed RMP would be similar to those described for Alternative A. However, the Proposed RMP also proposes temporal (i.e., winter and/or spring, depending on species) restrictions on surface-disturbing activities (to protect wildlife during critical life stages) and restricts OHV use in deer and elk crucial habitats. These management actions would also benefit soils by limiting activities during wet seasons (which would reduce soil compaction) and restricting activities that could result in vegetation loss. These management actions would improve soil stability and prevent soil loss caused by erosion.

Impacts from Wild Horses and Burros

Under the Proposed RMP, 600 AUMs are allocated to burros in the Canyonlands HMA to meet an AML upper limit of 100. These numbers are greater than either Alternative N or A, but less than C or D (which establish a herd size of between 120 and 200 head). Because more burros results in a greater possibility of adverse impacts on soil resources because of trampling, compaction, and reduced vegetation cover, the Proposed RMP would potentially impact soils more than Alternatives N or A but less than Alternatives C or D.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres would be managed to maintain wilderness characteristics. Management actions to achieve this objective include designating the area as closed to leasing or open to leasing subject to major constraints (NSO), limiting motorized uses to designated routes, and designating the area as VRM Class II. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to soils from surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion).

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forest and woodland products management would be similar to Alternative A, although more lands would be closed to this type of use under the Proposed RMP (one WSR segment—5 miles, compared to zero segments under Alternative A). Thus, localized surface disturbance, soil compaction, and changes in vegetation community composition and structure would be less under the Proposed RMP than under Alternative A.

Impacts from Livestock Grazing

The types of impacts experienced as a result of livestock grazing decisions would be similar to Alternative A, although less land would be available for grazing under the Proposed RMP (1,989,048 acres, compared to 2,025,998 acres under Alternative A). Thus, impacts to soils from livestock grazing (i.e., increased soil compaction in trailing, watering, and mineral-supplement areas) could occur over a larger area, although the difference between alternatives is negligible.

Impacts from Recreation

Under the Proposed RMP, five SRMAs (860,390 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Establishing a Factory Butte SRMA would limit the impacts of cross-country OHV use on soils to a 8,500 acre area. Construction of facilities in the Big Rock SRMA would have localized short-term impacts including soil compaction, reduced infiltration, and changes in surface hydrology. Managing the Dirty Devil/Robbers Roost SRMA (290,500 acres) for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for surface disturbance from recreation. Closing canyons within the Dirty Devil/Robbers Roost SRMA to OHV recreation use and limiting OHV recreation use to designated routes would reduce potential surface disturbance and localized soil erosion. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities would have site-specific impacts, including soil compaction, changes in surface hydrology, and increased runoff. Managing the Henry Mountains SRMA for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for soil disturbance.

The Proposed RMP, which establishes more areas as SRMAs than either Alternative N or A but less than either Alternative C or D, therefore would provide more protection to soils as a result of recreation decisions than either Alternatives N or A and would provide less protection than Alternatives C or D.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, the Proposed RMP designates only 9,890 acres (less than 1% of the RFO) as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,908,210 acres (90%) of the RFO; and 209,900 acres (10%) would be closed to motorized vehicle use. The amount of open areas, although greatly reduced as compared to Alternative N, would still result in impacts to soil from vehicle use in those areas. The remainder of the RFO would limit motorized use to designated routes—the public would have access to 4,277 miles of unpaved routes. Under the Proposed RMP, 345

miles of routes would be closed, allowing these areas to revegetate, which would benefit soils by reducing compaction, reducing runoff, increasing infiltration, and reducing erosion.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty management would be similar to those described under Alternative N. However, impacts to soils could occur over a smaller area because more acres would be proposed for withdrawal (176,200 acres under the Proposed RMP) and more acres would designated ROW avoidance areas (including 601,800 acres closed to leasing or open to leasing subject to major constraints [NSO], one suitable WSR segment—5 miles, and two ACECs—2,530 acres). Thus, impacts to soils from surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion) would be less under the Proposed RMP than under Alternative N.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. Development of oil and gas resources could affect soils because of the surface disturbances associated with such development. However, adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to soils. Closing or withdrawing areas from mineral operations would prevent impacts to soils within those areas. (See the Impacts from Lands and Realty section for a discussion of withdrawals.) The Proposed RMP proposes more acres of mineral withdrawals (176,200 acres) compared to Alternative N or A, which would preclude mineral and energy development in those areas and thus provide more protection to soils.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect soil by preventing ground-disturbing activities in the river corridor. One suitable segment (5 miles) would be managed to protect outstandingly remarkable values, free-flowing nature, and the wild classification under the Proposed RMP. This would benefit soils by limiting ground disturbance in this area. Of the remaining segments, 98 miles are within WSAs, leaving 32 miles on which ground-disturbing activities could potentially impact soils. The Proposed RMP would provide less protection to soils from WSR decisions than Alternative N, C, or D, but more protection than Alternative A.

Areas of Critical Environmental Concern

The Proposed RMP designates two ACECs (2,530 acres). Allowing no uses that would cause irreparable damage to the relevant and important values such as relic vegetation in these areas (i.e., closing to OHV use; managing as open to leasing subject to major constraints (NSO), depending on the ACEC; unavailable for livestock grazing; and acquiring inholdings) would reduce surface-disturbing activities within those areas, thus protecting soil resources.

Alternative C

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A, although under Alternative C fewer acres would be treated annually (averaging 26,000 annually for all treatments). In addition, Alternative C proposes using only natural processes to manage vegetation. Such processes could be less effective than conventional vegetation treatments and would not be effective in all vegetation communities. This approach could result in the loss of existing vegetation cover, indirectly increasing erosion. Thus, impacts to soils under Alternative C would likely result in reduced short-term impacts (altered vegetation structure and increased local erosion and sedimentation rates) compared to Alternative A, as well as reduced long-term impacts (improved vegetative cover and increased plant diversity, thereby stabilizing soil, improving overall watershed function and condition, and allowing greater infiltration and soil moisture storage).

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative C, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 230,600 acres (11%) would be designated as VRM Class II; 509,100 acres (24%) would be designated as VRM Class III; and 941,400 acres (44%) would be designated as VRM Class IV. Although the majority of the RFO would be designated as VRM Class III or IV (which could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying surface disturbance and potential for wind and water erosion and sedimentation to streams), less of the RFO would be designated in these VRM classes than in Alternative N or A or in the Proposed RMP, resulting in less potential impacts to soils compared to those alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under Alternative A. However, Alternative C proposes restricting surface disturbance or surface occupancy within 660 feet of riparian areas (versus 330 feet for Alternative A), includes more restrictions on OHV use in crucial wildlife habitats, and designates an ACEC in the Henry Mountains (288,200 acres) for the protection of wildlife values. These additional management actions would decrease the potential for soils impacts under Alternative C.

Impacts from Wild Horses and Burros

Under Alternative C, 1,200 AUMs are allocated to burros in the Canyonlands HMA to meet an AML upper limit of 200. These numbers are greater than Alternative N, A, or the Proposed RMP. Because more burros result in a greater possibility of adverse impacts on soil resources because of trampling, compaction, and reduced vegetation cover, Alternative C would potentially impact soils more than Alternatives N, A, or the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for soils.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forestry and woodlands management would be similar to the Proposed RMP, although more lands would be closed to this type of use under Alternative C (12 WSR

segments—135 miles). Thus, localized surface disturbance, soil compaction, and changes in vegetation-community composition and structure would be less under Alternative C than under the Proposed RMP.

Impacts from Livestock Grazing

Impacts would be the same as those described under the Proposed RMP.

Impacts from Recreation

Under Alternative C, four SRMAs (930,000 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Managing the Dirty Devil/Robbers Roost SRMA (375,800 acres) for dispersed recreation in a primitive setting would indirectly maintain or reduce the potential for surface disturbance from recreation. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities would have site-specific impacts including soil compaction, changes in surface hydrology, and increased runoff. Managing the Henry Mountains SRMA (533,900 acres) for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for soil disturbance. Managing the Sevier Canyon SRMA (7,500 acres) for scenic values would indirectly maintain and protect vegetation and soil resources that contribute to the scenic qualities of Sevier Canyon.

Alternative C, which establishes more areas as SRMAs than Alternative N, A, or the Proposed RMP but fewer areas than Alternative D, therefore would provide more protection to soils as a result of recreation decisions than Alternative N or A or the Proposed RMP and would provide less protection than Alternative D.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under the Proposed RMP. However, Alternative C designates no areas as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,445,000 acres (68%) of the RFO; and 683,000 acres (32%) would be closed to motorized vehicle use. The lack of open areas would eliminate impacts to soil from vehicle use in those areas. Limiting motorized use to designated routes—the public would have access to 3,192 miles of unpaved routes—would generally limit soils impacts to areas in the immediate vicinity of the designated route. Under Alternative C, 1,188 miles of routes would be closed, allowing these areas to revegetate, which would benefit soils by reducing compaction, reducing runoff, increasing infiltration, and reducing erosion.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty management would be similar to those described under Alternative N. However, impacts to soils could occur over a much smaller area because of an increase in acres proposed for withdrawal (331,100 acres under Alternative C) or designated as ROW avoidance areas; 735,000 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments (135 miles) and 16 ACECs (886,810 acres). Thus, impacts to soils from surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion) would be less under Alternative C, compared to Alternative N.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. Development of oil and gas resources could affect soils because of the surface disturbances associated with such development. However, adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to soils. Closing or withdrawing areas from mineral operations would prevent impacts to soils within those areas. (See the Impacts from Lands and Realty section for a discussion of

withdrawals.) Alternative C proposes more acres of mineral withdrawals (331,100 acres) than do Alternative N, A, or the Proposed RMP. This increase would preclude mineral and energy development in those areas and thus provide more protection to soils.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect soil by preventing ground-disturbing activities in the river corridors. All 12 suitable segments (135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative C. This would benefit soils by limiting ground disturbance in these areas.

Areas of Critical Environmental Concern

Alternative C designates 16 ACECs (886,810 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas (closing to OHV use; managing as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; designating as VRM Class II; making them unavailable for livestock grazing; and acquiring inholdings) would reduce surface-disturbing activities within those areas, thus protecting soil resources.

Alternative D

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N, although these impacts would occur over a much smaller area because of differences in VRM class designations between the two alternatives. Under Alternative D, 1,129,600 acres (53% of the lands managed by the RFO) would be designated as VRM Class I; 66,700 acres (3%) would be designated as VRM Class II; 355,100 acres (17%) would be designated as VRM Class III; and 576,600 acres (27%) would be designated as VRM Class IV. Just more than half of the RFO would be designated as VRM Class I or II, meaning that the existing character of the landscape must be preserved or retained. Thus, surface-disturbing activities would generally not be allowed in these areas, resulting in reduced potential for wind and water erosion and sedimentation to streams and less potential impacts to soils compared to Alternative N, A, or C or the Proposed RMP.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative C.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres would be managed to maintain wilderness characteristics. Management actions to achieve this objective include closing to oil and gas leasing, closing to OHV use, and designating as VRM Class I. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to soils from surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion). Therefore, of all the alternatives, Alternative D would therefore be most beneficial to soils.

Impacts from Forestry and Woodland Products

Impacts would be similar to those described for Alternative C, except that no commercial or non-commercial forest and woodland products resource use would be allowed within the 682,600 acres of non-WSA lands with wilderness characteristics. Thus, localized surface disturbance, soil compaction, and changes in vegetation community composition and structure would be greatly reduced under Alternative D, compared to all of the other alternatives.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative C.

Impacts from Recreation

Under Alternative D, seven SRMAs (1,358,100 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Managing these SRMAs for dispersed recreation in a primitive or semi-primitive setting would indirectly maintain or reduce the potential for surface disturbance from recreation. Associated management actions (closing or limiting OHV use and precluding development of facilities) would have minimize the potential for site-specific impacts including soil compaction, changes in surface hydrology, and increased runoff, which would indirectly maintain and protect soil resources.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. However, Alternative D designates 972,800 acres (46% of the RFO) as limited to designated routes and 1,155,200 acres (54%) as closed to motorized vehicle use. The lack of open areas would eliminate impacts to soil from vehicle use in those areas. Limiting motorized use to designated routes—the public would have access to 3,043 miles of unpaved routes—would generally limit soils impacts to areas in the immediate vicinity of the designated route. Under Alternative D, 1,242 miles of routes would be closed, allowing these areas to revegetate, which would benefit soils by reducing compaction, runoff, and erosion and increasing infiltration.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty management would be similar to those described under Alternative N. However, impacts to soils could occur over a much smaller area because more acres would be recommended for withdrawal (903,900 acres under Alternative D) and more acres would be designated ROW avoidance areas (1,203,800 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments, and 16 ACECs). Thus, impacts to soils from surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion) would be much less under Alternative D than under all the other alternatives.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. However, impacts to soils could occur over a much smaller area

because more acres would be recommended for withdrawal (903,900 acres under Alternative D) and more areas would be closed to leasing or open to leasing subject to major constraints (NSO) (1,203,800 acres). Closing or withdrawing areas from mineral operations would prevent impacts to soils within those areas. Thus, impacts to soils from mining-related surface-disturbing activities (such as compaction and vegetation removal, which could lead to erosion) would be much less under Alternative D than under all the other alternatives.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.3.3 Water Resources

This section presents potential impacts to water resources from management actions for other resource programs. Existing conditions for water resources are described in Chapter 3. The discussion of impacts to water resources is limited to the effects of surface-disturbing activities on water quality and watershed health. Activities that disturb the land surface, decrease vegetation cover, or otherwise alter land surface cover would potentially affect water quality and watershed health.

Water quality within the planning area is influenced by both natural and human factors. Water quality problems created by natural geologic conditions are almost impossible to control. Water quality is generally good in the upper reaches of streams. As water flows downstream, the chemical and biological quality of the water deteriorates as salts accumulate, ground cover diminishes, water temperatures increase, fecal coliform from livestock and wildlife increases, and sediments accumulate. Most of the sediment discharge by streams in arid and semi-arid regions is transported during brief periods, usually as a result of thunderstorms. Water quality relative to sediment content is best during periods of low flow; water quality relative to chemical content is best during high flow. The State Division of Water Quality (DWQ) is responsible for adopting, enforcing, and administering state and federal water quality regulations.

Compared to other natural and human-caused factors that affect water quality within the planning area, Proposed RMP decisions would have minor impacts on water quality.

Methods and Assumptions

The analysis is based on the following assumptions:

- Substantial surface disturbance to soil, including compaction of soil or loss of vegetative cover, could increase water runoff and downstream sediment loads, thereby degrading water quality, altering channel structure, and affecting overall watershed health.
- The degree of impact attributed to any one disturbance or series of disturbances would be influenced by several factors, including location within the watershed, time and degree of disturbance, existing vegetation, soil type, and precipitation.
- Restrictions on surface-disturbing activities should help to protect and maintain current water quality and to minimize erosion and sedimentation.
- An increase of pollutants in surface waters could affect other beneficial uses (e.g., stock-watering, irrigation, fisheries and aquatic life, recreation, drinking-water supplies).
- Proposed decisions that allow surface-disturbing activities that impact soils could also adversely impact water quality.
- Increased erosion does not necessarily result in increased sedimentation to a perennial stream.
- Some surface-disturbing actions, such as vegetation management projects, could cause short-term adverse impacts to water quality immediately following treatments but could benefit water quality in the long term as vegetation becomes reestablished.
- Proposed decisions that limit surface-disturbing activities or that protect or restore soil, water, and vegetation resources could protect or improve water quality.

Environmental Consequences

Impacts to water resources would likely result from actions proposed under the following resource programs:

- Soil Resources and Water Resources

- Vegetation
- Fish and Wildlife
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on water resources.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

Specific stipulations and permit requirements, including reclamation plans, to protect water resources during and after surface-disturbing activities in the RFO would minimize impacts. These stipulations include requiring that all surface-disturbing activities be the minimum necessary to complete the task; requiring reclamation plans for road upgrades or realignments; requiring specific soil-stability measures for all surface-disturbing activities and saline soils; closing and reclaiming temporary roads, facilities, and improvements that are no longer necessary; and maintaining a 500-foot buffer zone of no surface disturbance or surface occupancy around all springs to protect water quality. Impacts would be minor RFO-wide, but potentially moderate at specific sites. In the long term, these actions would reduce soil compaction, soil erosion, and surface runoff, which would protect water resources and maintain or improve water quality.

Impacts from Vegetation

Under Alternative N, vegetation treatments would be conducted in accordance with the *Fundamentals of Rangeland Health*, which require that water quality be protected. Initially, vegetation treatments change the vegetation structure and increase local erosion and sedimentation rates, which could adversely affect water quality. However, in the long term, vegetation treatments improve cover and increase plant diversity, thereby stabilizing soil, improving overall watershed function and condition, and allowing greater infiltration and soil moisture storage, which would help protect water quality.

Impacts from Fish and Wildlife

Under Alternative N, proposed decisions that recommend avoiding habitat fragmentation, reducing road densities, and mitigating surface disturbances would benefit water quality by reducing the potential for erosion and sedimentation of streams.

Impacts from Fire and Fuels Management

Alternative N allows for the full range of fire and fuels management actions to achieve ecosystem sustainability. This alternative also allows for treatment of vegetation (including mechanical, wildland fire use or prescribed fire, and chemical methods). This action would move vegetation communities more in line with the historic range of variability. Alternative N would better protect the soil and would increase water quality over the long term as more acres are treated.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness character on those lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for water resources.

Impacts from Forestry and Woodland Products

Under Alternative N, the timber harvest acreage and quantities of woodland products harvested (including fuelwood, fence posts, Christmas trees, and seed collection) would be small, so the overall effects on water quality would be negligible. There are more than 2 million acres of public land in the RFO, with the current average annual harvest of timber near zero board feet and other woodland product permits (averaging about 2 cords each) numbering in the hundreds. Additionally, all permits issued for forest and woodland products contain stipulations for the use of BMPs to minimize or eliminate impacts to all resources, including water.

Impacts from Livestock Grazing

Grazing has the potential to accelerate erosion rates and nutrient loads to surface water. As a result, contaminants such as nutrients and bacteria could wash directly into receiving waters from surface-water runoff in grazed areas. Livestock grazing in areas of low rainfall (less than 8 inches per year) generally does not contribute a significant amount of nutrients to surface water because of the aridity of the area, distance from perennial streams, plant uptake, and soil mineralization.

Livestock grazing in the RFO would be managed in keeping with applicable laws and regulations and with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration.* Adhering to these statewide standards and guidelines would minimize impacts from livestock grazing by maintaining plant vigor and increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, productivity, and riparian-wetland function. Alternative N would minimize impacts to water resources within the planning area.

Impacts from Recreation

Under Alternative N, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified that would affect water resources. Thus, intensively used recreation sites (such as those near Otter Creek, Big Rock, Factory Butte, and Dirty Devil/Robbers Roost) could experience impacts to water quality from OHV use and use by large numbers of visitors in a limited space. These activities could result in loss of vegetation cover and in soil compaction, leading to increased wind and water erosion. Under Alternative N, these impacts to water resources would continue or might increase as visitor use increases.

Impacts from Travel Management

OHV use has the potential to affect water quality by causing surface disturbance, channeling surface runoff, changing vegetation structure, and reducing riparian-wetland function. Roads and OHV routes can be primary sources of sediment and salinity delivery to rivers and streams. Of special concern are routes with a clay-based native surface and routes and cross-country vehicle use within riparian zones and Mancos shale areas. The magnitude and extent of motorized recreation has a greater impact on soil and water resources than non-motorized recreation does. OHV recreation use during periods of high soil-moisture conditions could accelerate localized erosion and damage vegetation.

Acreage open to cross-country OHV use under Alternative N would be 1,636,400 acres (77% of the RFO). Alternative N would therefore allow the greatest ground disturbance from cross-country OHV use and the greatest potential impacts to water quality from cross-country use. However, actual impacts would be dependent on where and when vehicles traveled. Generally, the more miles of open routes, the greater

the possibility of adverse impacts to water quality, although the location of routes (e.g., crossing streams, within riparian areas) is more important than sheer miles. Stream crossings by motorized vehicles could remove riparian vegetation, increase the amount of bare soil, increase localized soil erosion, change surface hydrology, and reduce infiltration, all of which can impact water quality. Alternative N would designate routes with the greatest number of stream crossings (Table 4-13), thus of all the alternatives, Alternative N would result in the most potential impacts to water resources.

Table 4-13. Off-Highway Route Designations and Stream Crossings

	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Miles of designated routes	4,315	4,312	4,277	3,192	3,043
Number of stream crossings	539	443	400	273	266

A specific water quality issue raised during scoping was the effect of cross-country OHV use in the Factory Butte area on water quality in the Fremont River. The lower Fremont River was listed on the State of Utah's 303(d) list as impaired for its agricultural beneficial use because of high concentrations of total dissolved solids (TDS). In 2002, a Total Maximum Daily Load (TMDL) plan was approved and the river was removed from the 303(d) list. The water quality goals for the lower Fremont River and tributaries were to reduce salt loading by improving the efficiency of irrigation systems (and thereby reducing return flows), to restore stream channel stability, and to eliminate TDS loading from the two artesian wells in Caineville Wash. BLM capped the two wells in 2004, fulfilling one of the three major goals.

The primary source of TDS in this watershed originates from the saline Mancos shale formation east of Capitol Reef National Park. Water flowing over, through, and under these shale badlands dissolves and transports salts to the Fremont River. Swing Arm City, north of Caineville, is an area of concentrated OHV use within the Mancos shale badlands. Erosion rates usually increase in areas heavily used by OHVs. However, increased erosion does not immediately result in the delivery of eroded solid particles and solutes to a perennial stream, especially in an arid environment. Swing Arm City drains into a broad alluvial fan before reaching the Fremont River. The lower Fremont is not listed as being impaired by sediment or selenium. Water quality standards and criteria adjacent to and downstream of Factory Butte are violated at very low flows when there is no upland runoff. This has persisted for a long period, predating the use of OHVs in the area.

Closing Swing Arm City to OHV use would not result in a significant improvement in downstream water quality. If concentrated OHV use expanded north into Neilson Wash, there would be a greater likelihood of increased sediment loading into the Fremont River because OHVs would impact previously undisturbed areas, increasing the soil erosion potential. Alternative N would allow OHV use to expand into Neilson Wash, possibly impacting water quality.

Impacts from Lands and Realty

Under Alternative N, 280 acres of public land are identified for Federal Land Policy and Management Act (FLPMA) land sales. Loss of these acres would have no effect on water quality. These lands are currently managed to meet state water quality standards as per the SRH. After disposal, use of these lands would be

beyond the control of BLM management, but it is assumed that any development that may occur would be regulated by the State and that state water quality standards would continue to be met.

Withdrawals protect land and other resources from mineral development or appropriation. Existing withdrawals shown in Chapter 3 (154,700 acres) would continue, with an additional 14,780 acres (developed recreation sites) recommended for withdrawal from mineral entry. Withdrawing developed recreation sites from mineral entry would not change water quality, assuming that no locatable mineral resource is located in these areas.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Development of oil and gas resources could affect water quality because of the surface disturbances associated with such development, although the permitting process would require potential impacts to water quality to be mitigated. Alternative N would have the most acres open under standard lease terms and 22,600 more acres than Alternative A closed to surface occupancy. However, mitigation at the time of leasing would preclude significant impacts to water quality. An estimated 8,180 acres would be disturbed over the next 15 years.

Leasable Minerals—Coal

Live water is protected by a buffer of 500 feet. Floodplains, alluvial valley floors, municipal watersheds, and other important water bodies would be protected under the unsuitability criteria. Water resources would be protected by mitigation to stabilize soil, to prevent unnecessary erosion, to revegetate disturbed surfaces, and to disallow any dumping of waste materials that would affect water quality.

Locatable Minerals

Exploration and development of locatable minerals creates surface disturbances that could adversely impact water quality through soil erosion and sedimentation. However, plan of operations-level development would be addressed in site-specific environmental analysis, and notice-level activity would be regulated to prevent undue and unnecessary degradation. Withdrawals (discussed under Impacts from Lands and Realty) would reduce the amount of land open to disturbance.

Salable Minerals

Proposed operations for salable minerals would be subject to a 500-foot buffer for live water. Water resources would be protected by mitigation to stabilize soil, to prevent unnecessary erosion, to revegetate disturbed surfaces, and to disallow any dumping of waste materials that would affect water quality.

Impacts from Special Designations

Wilderness Study Areas

Managing WSAs under non-impairment standards would prevent most ground-disturbing activities. This prevention would result in protection for water resources.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect water quality by preventing ground-disturbing activities in the river corridors. All eligible segments (12 segments—135 miles) would be protected under Alternative N, thus helping to protect water quality on those rivers.

Areas of Critical Environmental Concern

Protecting the relevant and important values of the potential ACECs would maintain or improve water quality in areas in which management prescriptions limit surface disturbance. In Alternative N, there are four existing ACECs comprising 14,780 acres. Protection for the relevant and important values includes travel restrictions (closed to OHV), recommended for withdrawal from mineral entry, unavailable for livestock grazing, and managed as open to leasing subject to major constraints NSO. These restrictions on surface-disturbing activities would provide protection for water resources in these areas.

Alternative A

Impacts from Soil Resources and Water Resources

Impacts would be similar to those described for Alternative N except that the buffer zone for no surface disturbance or surface occupancy around all springs, to protect water quality, would be 330 feet (rather than 500 feet). Thus, the protected area would be less (8 acres around all springs in Alternative A versus 18 acres in Alternative N), although the area immediately surrounding the springs would still be protected.

Impacts from Vegetation

Impacts would be the same as those described under Alternative N.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Under Alternative A, appropriate management response (AMR) would be implemented (as in Alternative N), but fewer acres would be treated. Over time, vegetation communities would be less in line with the historic range of variability, resulting in a reduced level of protection for soil and in reduced water quality. Hazardous-fuels reductions projects could have short-term adverse impacts on water quality. Depending on the timing and intensity of rainfall, increased runoff and soil erosion might originate from treated areas. However, in the long term, prescribed fire and other fuel treatments have been shown to decrease runoff and erosion through the rejuvenation of native grasses. The potential short-term impacts of prescribed fire and other fire treatments can be minimized by limiting their use on steep slopes and near riparian areas.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness character on those lands outside of WSAs are proposed under Alternative A, resulting in no additional protection for water resources.

Impacts from Forestry and Woodland Products

Alternative A allows for harvesting of forest and woodland products across most of the RFO (all areas, outside of WSAs) where sustainable and compatible with restoring, maintaining, or improving forest health. Harvest of commercial and non-commercial forest and woodland products based on sustainability and compatibility with forest and woodland health would have no impact on water quality. Permitted activities under Alternative A would incorporate BMPs into the stipulations, to minimize or totally eliminate any created impacts. These stipulations have been developed over time by using site-specific experience. The stipulations, coupled with the projected limited amount of activity in the forestry and woodland program in the RFO, would support the determination of no impact to water resources.

Impacts from Livestock Grazing

Impacts to water resources would be similar to those described under Alternative N, except that an additional 36,950 acres would be available to livestock grazing under Alternative A. However, because livestock grazing within the RFO would be managed in keeping with applicable laws and regulations, with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration,* and with BLM's riparian policy, impacts to water resources from livestock grazing would be minimal.

Impacts from Recreation

Recreational activities can have site-specific impacts to water quality because of surface-water runoff near frequent and high-use areas such as campgrounds, parking lots, trailheads, and other recreation-related use areas. There are five SRMAs proposed for Alternative A, comprising 516,500 acres. Limiting OHV use in the Otter Creek Reservoir SRMA to designated routes would maintain existing soil, water, and riparian resource conditions by concentrating impacts to already disturbed areas and reducing the extent of soil compaction. Maintaining the existing condition of riparian-wetland areas would reduce soil erosion. Reducing the extent of soil compaction would indirectly maintain existing infiltration and soil-water distribution patterns, reducing sedimentation into surface waters.

The construction of recreation facilities in the Big Rock SRMA could have localized adverse impacts from removal of vegetation in those areas; long-term impacts would be beneficial by concentrating use areas and thus limiting the extent of vegetation disturbance. Managing the Dirty Devil/Robbers Roost SRMA (290,000 acres) for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for vegetation disturbance from recreation. Limiting OHV recreation use in the Dirty Devil/Robbers Roost SRMA to designated routes would reduce potential surface disturbance and localized removal of vegetation. Managing the Sahara Sands SRMA (12,300 acres) for a roaded natural recreational opportunity and the development of facilities would have site-specific impacts, including soil compaction, changes in surface hydrology, and increased runoff. Managing the Factory Butte SRMA (199,700 acres) for a motorized recreational opportunity and allowing moderate-to-extensive landscape modification would have potentially major impacts on water resources by eliminating vegetation or altering plant communities (reducing species diversity or increasing the potential for introduction and spread of invasive species) over a relatively large area.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative A designates 449,000 acres (21% of the RFO) as open to motorized vehicle use; motor vehicles would be limited to designated routes on 1,679,000 acres. Actual impacts would depend on where and when vehicles traveled. Alternative A would designate approximately the same miles of routes but with 22% fewer stream crossings (443, compared to 539 under Alternative N). Thus, Alternative A should have less adverse impacts on water quality.

Impacts from Lands and Realty

Under Alternative A, 13,400 acres of public land are identified as available for FLPMA Section 203 sales (the same as under the Proposed RMP). Loss of these acres would have no effect on water quality—these lands are currently managed to meet state water quality standards as per the *Standards and Guidelines for Grazing Administration.* After disposal, use of these lands would be beyond the control of BLM management, but it is assumed that any development that may occur would be regulated by the State, and that state water quality standards would continue to be met.

Land withdrawals protect land and other resources from mineral development or appropriation. Alternative A proposes no new withdrawals (only the 154,700 acres currently withdrawn). Exploration and development of locatable minerals creates surface disturbances that could adversely impact water

quality through soil erosion and sedimentation. Because Alternative A would include the fewest acres withdrawn from mineral entry, impacts to water resources would be expected to be the greatest under Alternative A.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Development of oil and gas resources could affect water quality because of the surface disturbances associated with such development, although the permitting process would require potential impacts to water quality to be mitigated. Alternative A would have 375,900 fewer acres than Alternative N open under standard lease terms and the fewest amount of acres closed to surface occupancy. However, mitigation at the time of leasing would preclude significant impacts to water quality. Over the next 15 years, an estimated 8,180 acres would be disturbed.

Leasable Minerals—Coal

Impacts to water resources are the same as under Alternative N, except the buffer around live water and springs would be 330 feet.

Locatable Minerals

Exploration and development of locatable minerals creates surface disturbances that could adversely impact water quality through soil erosion and sedimentation. However, plan of operations-level development would be addressed in site-specific environmental analysis, and notice-level activity would be regulated to prevent undue and unnecessary degradation. Withdrawals (discussed under Impacts from Lands and Realty) would reduce the amount of land open to disturbance.

Salable Minerals

Proposed operations for salable minerals are subject to the oil and gas leasing restrictions. Live water and springs would be protected by a buffer of 330 feet, subject to an appropriate exception when there are no practical alternatives and impacts can be fully mitigated. Water resources would be protected by mitigation to stabilize soil, to prevent unnecessary erosion, to revegetate disturbed surfaces, and to disallow any dumping of waste materials that would affect water quality.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect water quality by preventing ground-disturbing activities in the river corridors. No eligible segments would be recommended as suitable under Alternative A, resulting in no additional protection for water resources. However, most of the eligible river segments (98 of the 135 total miles) are also within WSAs, which would provide protection for water resources because of lack of surface-disturbing activities within WSAs.

Areas of Critical Environmental Concern

Protecting the relevant and important values of the potential ACECs would maintain or improve water quality in areas in which management prescriptions limit surface disturbance. In Alternative A, there are no potential ACECs, and the four existing ACECs (comprising 14,780 acres of land) would be eliminated. Thus, there would be no protection of relevant and important values from irreparable damage

in these areas possibly posing a threat to water resources from various surface-disturbing activities such as open OHV use and mineral development.

Proposed RMP

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative A.

Impacts from Vegetation

Impacts would be the same as those described under Alternative N.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be similar to those described under Alternative A, except that more acres would potentially be treated, moving vegetation communities more in line with the historic range of variability which would better protect soil resources and increase water quality.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres would be managed to maintain wilderness characteristics. Management actions to achieve this objective include designating the area as closed to leasing or open to leasing subject to major constraints (NSO) for oil and gas leasing; limiting motorized uses to designated routes; and designating as VRM Class II. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to water quality from surface-disturbing activities (such as stream crossings by OHVs and vegetation removal, which could lead to erosion).

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative A, except that more lands would be closed to this type of use under the Proposed RMP (one WSR segment—5 miles, compared to zero segments under Alternative A, and the Old Woman Front ACEC—330 acres). Areas in which forest and woodland products harvest would occur would incorporate BMPs into permit stipulations to minimize or eliminate any impacts to water resources.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts to water quality would be similar to those described for Alternative A except that the Proposed RMP proposes five SRMAs comprising 860,390 acres. Recreation activities on these five SRMAs include motorized activities at Big Rocks and Factory Butte, which are open OHV areas (8,590 acres). The rest of the area varies from semi-primitive motorized to primitive recreation, with many protective measures for coincident WSA, WSR, and ACEC areas. Impacts from recreation management actions are considered negligible for the Proposed RMP and would not affect water quality beyond the natural "background" level of contaminants from erosion and runoff.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, the Proposed RMP designates only 9,890 acres (less than 1% of the RFO) open to cross-country OHV use. The Proposed RMP closes 209,900 acres and limits motorized use to

designated routes on 1,908,210 acres. Routes designated under this alternative would include 400 stream crossings—fewer than under Alternative N or A but more than under Alternative C or D.

Impacts from Lands and Realty

Under the Proposed RMP, 13,400 acres of public land are identified as available for FLPMA Section 203 sales. As described under Alternative A, loss of these acres would have no effect on water quality.

Land withdrawals protect land and other resources from mineral development. The Proposed RMP proposes 21,500 acres of new withdrawals and continuation of existing withdrawals (154,700 acres). Exploration and development of locatable minerals creates surface disturbances that could adversely impact water quality through soil erosion and sedimentation. Thus, withdrawing these lands from mineral entry could slightly reduce the potential impacts to water resources, compared with Alternatives N and A.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Development of oil and gas resources could affect water quality because of the surface disturbances associated with such development, although the permitting process would require potential impacts to water quality to be mitigated. The Proposed RMP would have 608,700 acres open to leasing subject to the standard terms and conditions and 154,500 acres open to leasing subject to major considerations (NSO), whereas Alternative A has 0 acres open to leasing subject to major constraints (NSO) and Alternative N has 22,600 acres closed to surface occupancy. However, mitigation at the time of leasing would preclude significant impacts to water quality. Over the next 15 years, an estimated 8,180 acres would be disturbed.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative A.

Locatable Minerals

Exploration and development of locatable minerals creates surface disturbances that could adversely impact water quality through soil erosion and sedimentation. However, plan of operations-level development would be addressed in site-specific environmental analysis, and notice-level activity would be regulated to prevent undue and unnecessary degradation. Withdrawals (discussed under Impacts from Lands and Realty) would reduce the amount of land open to disturbance, thereby helping to protect water resources.

Salable Minerals

Impacts would be the same as those described under Alternative A.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under the Proposed RMP, one segment with a tentative classification of Wild (the Fremont Gorge—5 miles) would be recommended as suitable. This would serve to protect water quality on that river segment. Protecting the outstandingly remarkable values of this WSR would help protect water quality by preventing ground-disturbing activities in the river corridors. Of the remaining segments, 98 miles are within WSAs, leaving 32 miles on which ground-disturbing activities could potentially impact water

resources. The Proposed RMP would provide less protection to water resources from WSR decisions than under Alternative N, C, or D but more than under Alternative A.

Areas of Critical Environmental Concern

Protecting the relevant and important values of the potential ACECs could improve water quality in areas in which management prescriptions limit surface disturbance. Under the Proposed RMP, two ACECS (2,530 acres) would be designated. Protection of the relevant and important values would include actions such as travel restrictions (closed to OHV), recommending for withdrawal from mineral entry, making the ACECs unavailable for livestock grazing, and managing them as open to leasing subject to major constraints (NSO). These restrictions on surface-disturbing activities would provide protection for water resources in these areas.

Alternative C

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative A.

Impacts from Vegetation

Impacts would be the same as those described under Alternative N.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be similar to those described under Alternative A, except that fewer acres would be treated.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness character on those lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for water resources.

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under the Proposed RMP, except that more lands would be closed to this type of use under Alternative C (12 WSR segments—135 miles, compared to 0 segments under Alternative A). Areas in which forest and woodland products harvest would occur would incorporate BMPs into permit stipulations to minimize or eliminate any impacts to water resources.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Recreational activities can have site-specific impacts to water quality because of surface water runoff near frequent and high-use areas such as campgrounds, parking lots, trailheads, and other recreation-related use areas. There are four SRMAs (comprising 930,000 acres) proposed for Alternative C. Recreation activities on these four SRMAs include dispersed recreation, emphasizing semi-primitive to primitive recreation activities as opposed to motorized activities. These areas have many coincident protective measures for overlapping WSA, WSR, and ACEC areas. Impacts from recreation management actions are considered negligible and would not affect water quality beyond the natural “background” level of contaminants from erosion and runoff.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N, except that Alternative C designates no areas as open to cross-country OHV use, designates 683,000 acres as closed to OHV use, and designates 1,445,000 acres in which motorized use would be limited to designated routes. Routes designated under Alternative C would include 273 stream crossings—fewer than Alternative N, A, or the Proposed RMP but slightly more than Alternative D.

Impacts from Lands and Realty

Under Alternative C, no lands are identified for FLPMA Section 203 sales. This would result in the continuation of management of water quality on all federal lands to meet state water quality standards as per the *Standards and Guidelines for Grazing Administration.*

Alternative C also recommends withdrawing 331,100 acres from mineral entry. Potential surface disturbance caused by mineral entry would therefore be reduced over Alternatives N, A, and the Proposed RMP, thus providing protection for water resources by minimizing erosion and sedimentation to surface waters.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Development of oil and gas resources could affect water quality because of the surface disturbances associated with such development, although the permitting process would require mitigation of potential impacts to water quality. Alternative C would designate 491,900 acres as open to leasing subject to standard terms conditions and 148,700 acres as open to leasing subject to major constraints (NSO);Alternatives A and N would designate 0 acres and 22,600 acres, respectively, as closed to surface occupancy. However, mitigation at the time of leasing would preclude significant impacts to water quality. Over the next 15 years, an estimated 8,180 acres would be disturbed.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N, except that the buffer for live water and springs would be 660 feet.

Locatable Minerals

Exploration and development of locatable minerals creates surface disturbances that could adversely impact water quality through soil erosion and sedimentation. However, plan of operations-level development would be addressed in site-specific environmental analysis while notice level activity would be regulated to prevent undue and unnecessary degradation. Withdrawals (discussed under Impacts from Lands and Realty) would reduce the amount of land open to disturbance.

Salable Minerals

Impacts would be the same as those described under Alternative A, except that the buffer for live water and springs would be 660 feet.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect water quality by preventing ground-disturbing activities in the river corridors. All 12 eligible segments (135 miles) would be protected under Alternative C, resulting in protection for water resources.

Areas of Critical Environmental Concern

Protecting the relevant and important values of the potential ACECs would maintain or improve water quality in areas in which management prescriptions limit surface disturbance. In Alternative C, 16 ACECs (886,810 acres) would be designated. Associated management of these ACECs to protect relevant and important values would include restricting travel (closed to OHV use), recommending the ACECs for withdrawal from mineral entry, making the ACECs unavailable for livestock grazing, and managing the ACECs as open to leasing subject to major constraints (NSO). Alternative C (along with Alternative D) would provide the most protection for water quality because of ACEC designations.

Alternative D

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative A.

Impacts from Vegetation

Impacts would be the same as those described under Alternative N.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be similar to those described under Alternative A, except that fewer acres would be treated.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres would be managed to maintain wilderness characteristics. Management actions to achieve this objective include closing to oil and gas leasing, closing to OHV use, and designating as VRM Class I. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to water quality from surface disturbing activities (such as stream crossings with OHVs and vegetation removal, which could lead to erosion). Of all the alternatives, Alternative D would therefore be most beneficial to water quality.

Impacts from Forestry and Woodland Products

Impacts would be the same as those described under Alternative C, except that no harvest would be allowed on lands with wilderness character. Areas in which forest and woodland products harvest would occur would incorporate BMPs into permit stipulations to minimize or eliminate any impacts to water resources.

Impacts from Livestock Grazing

Impacts would the same as those described under Alternative A.

Impacts from Recreation

Under Alternative D, seven SRMAs (1,358,100 acres) would be established. Recreation activities on these SRMAs include dispersed recreation, emphasizing semi-primitive to primitive recreation activities

as opposed to motorized activities. These areas have many coincident protective measures for overlapping WSA, WSR, and ACEC areas. Impacts from recreation management actions are considered negligible and would not affect water quality beyond the natural "background" level of contaminants from erosion and runoff.

Impacts from Travel Management

The types of impacts from travel management would be similar to those described under Alternative C—there are no open OHV areas under Alternative D. However, the amount of acres closed to OHV use (1,155,200) is the largest of all alternatives. Therefore, of all the alternatives, Alternative D would have the least impacts on water resources from travel management.

Impacts from Lands and Realty

Impacts from FLPMA land sales would be the same as those described under Alternative C.

The types of impacts would be similar to those described under Alternative N, except that Alternative D recommends substantially more acres (903,900 acres, or 42% of the RFO) for withdrawal from mineral entry. As a result, potential surface disturbance caused by mineral entry (and associated impacts to water resources) would be greatly reduced, compared to the other alternatives.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Development of oil and gas resources could affect water quality because of the surface disturbances associated with such development, although the permitting process would require mitigation of potential impacts to water quality. Alternative D would designate 290,200 acres as open to leasing subject to standard terms and conditions and 43,300 acres as open to leasing subject to major constraints (NSO); Alternatives A and N would designate 0 acres and 22,600 acres, respectively, as open to leasing subject to major constraints (NSO). However, mitigation at the time of leasing would preclude significant impacts to water quality. During the next 15 years, an estimated 8,180 acres would be disturbed.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative C.

Locatable Minerals

Exploration and development of locatable minerals creates surface disturbances that could adversely impact water quality through soil erosion and sedimentation. However, plan of operations-level development would be addressed in site-specific environmental analysis, and notice-level activity would be regulated to prevent undue and unnecessary degradation. Withdrawals (discussed under Impacts from Lands and Realty) would reduce the amount of land open to disturbance.

Salable Minerals

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.3.4 Vegetation

This analysis addresses the potential impacts to vegetation resources as described in Chapter 3—including desert shrub, sagebrush steppe, forests and woodlands, riparian resources, and invasive nonnative species—that could result from implementing the management actions under the alternatives described in Chapter 2. Vegetation is a fundamental and vitally important component of the biological resources in the RFO. The effects on vegetation that result from implementing any of the alternatives under consideration would also affect other resources. Impacts to the vegetation resource could result in reduced biological productivity, weed invasion, and unwanted changes in the composition, function, and structure of vegetation communities. These changes, in turn, could influence forage availability for wildlife and livestock. Where actions result in loss or reduction of vegetative cover or soil erosion or compaction, archaeological, paleontological, historic, wildlife, water, soil, and air resources could be impacted.

The effects of management actions on vegetative communities may vary, depending on a variety of factors such as the type of soils, moisture, topography, and plant reproductive characteristics. Impacts on vegetation resources also vary depending on the seral stage and composition of vegetation communities, as discussed in Chapter 3. The composition of a plant community changes over time as a result of interactions with factors such as climate, resource uses, and disturbance. Surface disturbance can result in the most immediate direct impact to an area, by removing existing vegetation and increasing opportunities for establishment of noxious weeds and invasive species. This could in turn reduce vegetation diversity, production, desirable plant cover, and overall ecological health of vegetation communities. Decreased ecological health would make vegetation communities less resilient to disease, drought, fire, invasive species, and other natural disturbances and stressors. Indirectly, surface disturbance could increase erosion rates, modify soil composition, and alter water flow patterns across the landscape. On the contrary, implementing vegetation treatments (mechanical, fire, biological, and chemical), managing vegetation and ecological resources to meet desired vegetation conditions, and limiting or restricting surface disturbances could serve to generally improve vegetation and ecological conditions. Although short-term losses of vegetation cover would occur, over the long term these actions would help remove undesirable species, increase species and age class diversity, improve vegetation composition and structure, and increase vegetation cover and improve ecological conditions. This would result in healthier vegetation communities that are more capable of retaining moisture and nutrients and of resisting disease, invasive species, drought, and other natural disturbances and stressors.

Methods and Assumptions

This analysis was based on the following assumptions:

- Adequate vegetative ground cover and species composition for site stabilization could typically occur within 5 to 10 years in sagebrush/grass communities depending on climate, soil, and site potential.
- Plant communities would be managed toward achieving a mix of species composition, cover, and age classes.
- The degree of impact attributed to any one disturbance or series of disturbances would be influenced by several factors, including location within the watershed; the type, time and degree of disturbance; existing vegetation; and precipitation.
- Noxious and invasive weeds would continue to try to invade and spread as a result of surface disturbing activities, vehicle traffic, recreational activities, wildlife and livestock grazing, and natural causes.
- Weed and pest control would be carried out in coordination with the appropriate county, public, and private interests.

- Climatic fluctuation would continue to influence the health and productivity of plant communities on an annual basis.
- Table 2-11a establishes estimated annual vegetation treatment acres for Alternatives A through D, to achieve the overall treatment acres for those alternatives over the life of the plan. Actual annual treatment acreage would vary depending on conditions, staffing, and similar factors. These acreage figures include all vegetation and fire and fuels treatments.

The analysis of vegetation, which includes structure, productivity, vigor, percent cover, density, and species composition, was based on likely changes relative to movement toward or away from desired vegetation conditions. In the absence of quantitative data, professional judgment was used, and impacts are sometimes described using ranges of potential impacts or in qualitative terms, if appropriate. Particular focus was placed on vegetation communities with the greatest sensitivity to changes in structure and species composition and at the most risk from potentially severe mortality events such as drought, insects, and disease infestation.

Environmental Consequences

Impacts to vegetation would likely result from actions proposed under the following resource management programs:

- Soil Resources
- Vegetation and Fire and Fuels Management
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Wild Horses and Burros
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on vegetation.

Alternative N: No Action

Impacts from Soil Resources

Implementing BMPs to minimize detrimental impacts to soils and water quality from ground-disturbing activities and maintaining or enhancing riparian areas through project design features or stipulations would help to reduce soil erosion, surface runoff, and sedimentation of streams. This reduction would help to maintain or improve upland vegetation and riparian and wetland communities. Making necessary management adjustments to meet watershed and riparian objectives (e.g., *Standards and Guidelines for Grazing Administration* and Utah BLM Riparian Management Policy) would reduce the potential for impacts on creeks, springs, and riparian areas associated with trampling and removal of understory vegetation, thus generally maintaining or improving riparian conditions as well as upland vegetation and wetlands.

Impacts from Vegetation and Fire and Fuels Management

Restoration and Vegetation Treatments

Impacts would vary by the method used to accomplish the treatment, whether manual, mechanical, chemical, biological, or fire. Vegetation treatments are designed to move plant communities towards desired conditions. Not implementing these treatments would inhibit or prevent attainment of ecological objectives and desired conditions for desert shrub, sagebrush steppe, forest and woodland, and riparian communities. Where fuel loads are excessive, failure to conduct vegetation treatments could increase the risk of catastrophic fire, which would put tens of thousands of acres at risk of vegetation loss and would impair riparian-wetland functioning condition. Catastrophic fire would also cause major, long-term indirect impacts in terms of wildlife habitat loss and long-term or permanent reduction in biomass productivity from erosion.

Vegetation treatments are designed to change vegetative composition and diversity from one state to another. As a result, most treatment methods initially remove some or all of the surface vegetation. This removal results in reduction of ground cover and increased erosion. Depending upon the method used, there may also be varying levels of surface disturbance, particularly when mechanical treatment methods are used. Because seeding success is greatest when seeds are covered by soil and protected from erosion and when moisture is held, treatment methods that disturb soils often have higher success rates compared to those methods that do not disturb soils. Successful treatments would increase ground cover and vegetative diversity, providing soil stability, reducing soil surface temperatures, increasing water-holding capability, and increasing food and cover for wildlife. These increases would improve the ecological health of desert shrub, sagebrush steppe, and forests and woodlands and would increase riparian-wetland functioning condition in treated areas.

The greatest level of environmental impact occurs when a vegetation treatment fails. A vegetation treatment is considered a failure when the existing vegetation is not removed or the target vegetative community does not become established. When the existing vegetation remains at the site, the environmental consequences to soil are minimal. However, when the treatment is successful in removing existing vegetation but the desired future vegetative community does not become established, a variety of consequences can result. In such cases, mechanical and other surface-disturbing treatment methods can lead to increased erosion because effective ground cover would be greatly reduced. Increased invasion of noxious weeds and other exotic weed species, decreased water availability, and long-term changes in habitat and species composition could occur. The duration of these effects would vary by treatment method, habitat and community type, availability of appropriate seed, and amount and timing of precipitation. Most such failed treatments would eventually be revegetated by either the former plant community or by some new and perhaps less-desirable community.

Because of the dynamic nature of vegetative communities, even those areas in which seedings are unsuccessful would eventually become filled in with vegetation. Treatment areas change over time as vegetation is re-established. Some areas treated early in the planning cycle would become completely re-vegetated and could conceivably require treatment maintenance prior to the next planning cycle. Failed treatments would not be considered permanently “lost” from the system unless the site became re-established with a highly stable, non-target plant community. Treatment methods that proved to be unsuccessful at achieving the desired results would be modified or discontinued. Because most treatments require at least two growing seasons to determine success, it is unlikely that unsuccessful methods would be used for more than 2 consecutive years. As a result, the potential for failed treatments to occur on the maximum number of acres available for treatment is considered negligible. Use of adaptive management should reduce or eliminate the potential for permanent loss of desired vegetation communities from treatments.

Manual Vegetation Treatments

Compared to other methods, manual treatments would have minimal effects to sensitive vegetative communities because these treatments would avoid destruction of non-target species and therefore would result in a lower likelihood of erosion, soil instability, sedimentation, or increased surface temperatures.

Mechanical Vegetation Treatments

Use of mechanical tools in most sites would reduce canopy cover, increase diversity of understory vegetation, increase soil moisture (because of a reduction of evapotranspiration), and change vegetation type. These impacts would be direct, would be both short- and long-term, and would positively affect some species while adversely affecting others. Creeks, springs, and riparian areas could be adversely affected from the increased run-off and erosion in the short-term until vegetation reestablishes. Long-term, indirect impacts would result from changes in habitat type, which in turn would result from the changes in vegetation density, canopy cover, structure, and the protection and maintenance of vegetation communities. Mechanical treatment methods could also result in localized, short-term impacts to air quality from fugitive dust, equipment emission and exhaust, and chemical fumes, which could lead to reduced plant vigor and fitness or to mortality among individuals or species.

Biological Vegetation Treatments

Target species would experience direct, short-term impacts caused by biological vegetation treatments. Depending upon the biological control agent, a variety of other direct and indirect effects could occur, including mortality of non-target species. As with other vegetation treatment methods, indirect effects would include reduced soil infiltration, increased erosion and sedimentation, increased soil surface temperatures, and short- or long-term changes in species composition or community structure. Creeks, springs, and riparian areas could be adversely affected from the increased run-off and erosion in the short term, until vegetation re-establishes.

Chemical Vegetation Treatments

Target and some non-target species would experience direct, short-term impacts, depending upon the chemical used and the application rate. Indirect effects would include reduced soil infiltration, increased erosion and sedimentation, increased soil surface temperatures, and short- or long-term changes in species composition or community structure. Creeks, springs, and riparian areas could be adversely affected from the increased run-off and erosion in the short term, until vegetation reestablishes. Direct and indirect effects from the use and application of specific chemicals are described in detail in the Final EIS for Vegetation Treatment on BLM Lands in Thirteen Western States (BLM 1991a), as well as the draft revision of the document (BLM 2005).

Prescribed Fire, Fire Use, and Management

The intensity of impacts from prescribed fire and fire use would depend on the size and severity of the fire, as well as the fuel type and quantity. Impacts from fires that cause injury or loss of individual plants and an increase in soil moisture caused by the reduction of evapotranspiration would be short-term and minor. Impacts from fires that change species composition, plant density, and vegetative structure and that increase the abundance of non-native invasive, fire-adapted plant species would be direct, major, and both short- and long-term. Reduced biomass productivity caused by accelerated erosion resulting from the reduction in effective ground cover, as well as reduced habitat suitability for seed dispersers, would represent indirect, major impacts. Creeks, springs, and riparian areas could be adversely affected from the increased run-off and erosion in the short term, until vegetation reestablishes. However, these projects are designed to minimize erosion and increase habitat suitability. If these major impacts cannot be mitigated, the project would not be approved or implemented.

Fire Suppression

Direct impacts from the removal of vegetation from hand-line construction would be short-term and minor. Impacts from using aerially-applied retardant as an alternative to hand-line construction would be negligible. Most impacts from fire suppression activities would be minor, short-term, and localized, particularly if activities in sensitive habitats are mitigated or avoided. Impacts in the arid desert-scrub communities could be longer term because these vegetation communities do not recover as readily.

Control of Noxious Weeds and Invasive Species

Impacts depend upon the method used. Alternative N would allow a full range of treatments for controlling noxious weeds and would help ensure a high degree of success. Direct impacts to the target species from manual techniques and herbicide applications would range from minor to moderate, with some non-targets experiencing impacts in the short term. Eradication of noxious weeds and invasive species and improved species composition for the remaining community would occur over the long term. Controlling noxious and invasive species would also benefit riparian habitat by reducing competition with native species and by allowing natural ecosystems to reestablish.

Collection and Use of Native Seed/Use of Non-native Plants

Under Alternative N, collection and use of native seed could be authorized with a permit. Collection of native seed could result in localized, minor short-term impacts to vegetation from trampling, loss of individuals, reduction in seed availability at the collection site, and potential reduction in plant vigor. The availability of local native seed would result in moderate indirect long-term impacts, which include improved ability to achieve desired conditions by improving the species composition in areas needing vegetation treatments.

Assuming that the criteria described in Chapter 2 are met, non-native plant species could be used in treatment or restoration efforts. The major short-term direct impact from the use of nonnative plant species is the stabilization of soils following disturbance when native species are ineffective, cannot be established, or are unavailable. The major short- and long-term indirect impacts from use of non-native plant species for re-seeding would be an undesirable change in species composition, resulting from introducing species that could out-compete natives or increase the frequency or intensity of wildfire.

Impacts from Visual Resources

Implementing VRM guidelines would increase the difficulty of accomplishing vegetation management actions and would limit the extent and effectiveness of the restoration efforts. Vegetation treatment projects would generally not occur in VRM Class I areas; however, under Alternative N, none of the lands managed by the RFO are classified as VRM Class I. Vegetation treatment, restoration, and weed treatment projects on 529,500 acres (25% of the RFO) within VRM Class II areas could be redesigned, moved, or otherwise restricted. The lack of vegetation treatments could result in increased vegetation density, increased density of late seral succession vegetation, and increased establishment of noxious and invasive species in VRM Class I and II areas. These increases could lead to lead to significant loss of unique vegetation characteristics, reduce resistance to disease and insect pest infestations, and increase the risk of uncharacteristically large or intense wildfires. Decreased ecological health of vegetation communities and riparian-wetland function could result. Managing for VRM Classes III and IV would allow the greatest flexibility for vegetation treatments. Because 569,000 acres would be managed as VRM Class III and 1,029,500 acres would be managed as Class IV, there would be various locations in which proposed projects could be relocated. These projects could assist in achieving desired conditions. See the discussion of restoration and vegetation treatments in the Impacts from Vegetation and Fire and Fuels Management section for a discussion of impacts.

Impacts from Special Status Species

Alternative N (along with all the other alternatives) prohibits actions that destroy, adversely modify, or fragment federally listed species habitat; proposes habitat improvements for SSS; and considers SSS habitat in all wildland fire suppression efforts. Restrictions on vegetation treatments in SSS habitats would reduce or eliminate potential impacts to vegetation from treatment projects. Impacts would vary according to the type of treatment proposed and the nature and extent of the restrictions. Failure to implement vegetation treatments, especially treatments to control noxious weeds, in these habitats could result in direct and indirect long-term impacts to vegetation. The lack of vegetation treatments could result in increased vegetation density, increased density of late seral succession vegetation, and increased establishment of noxious and invasive species in SSS habitats. This could lead to significant loss of unique vegetation characteristics, reduce resistance to disease and insect pest infestations, and increase the risk of uncharacteristically large or intense wildfires. Decreased ecological health of vegetation communities and riparian-wetland function could result.

Restricting authorized uses for SSS would reduce or eliminate disturbances that would otherwise have affected vegetation. All these actions would benefit vegetation by helping to maintain vegetation communities and riparian-wetland functioning condition.

Impacts from Fish and Wildlife

Proposed decisions for fish and wildlife management, such as avoiding habitat fragmentation, reducing road densities, and restricting surface disturbance or surface occupancy within 500 feet of riparian areas in the Cedar/Beaver/Garfield/Antimony Proposed RMP area and within 330 feet of riparian areas throughout the remainder of the RFO would reduce or eliminate potential impacts to desert shrub, sagebrush steppe, forest and woodland, and riparian communities. Closing routes would reduce introduction of noxious and invasive species, increase plant vigor, and reduce plant mortality associated with dust generation alongside the road. Compaction would also be eliminated along the closed route, which would increase infiltration and reduce erosion, thereby improving vegetative cover and riparian-wetland functioning condition.

Alternative N proposes habitat treatments to meet terrestrial, aquatic, and riparian habitat objectives. Implementation of these vegetation treatments would involve removing individual plants and altering species composition and vegetation structure. Impacts would vary according to the treatment method used (see Impacts from Vegetation Resources) and would initially change the vegetation structure and increase local erosion and sedimentation rates. However, in the long term, vegetation treatments would improve cover and increase plant diversity, thereby stabilizing soil, improving overall watershed and riparian function and condition, and allowing greater infiltration and soil moisture storage. Therefore, impacts to vegetation from proposed decisions for fish and wildlife would be beneficial overall.

Grazing by wildlife can alter vegetation communities and impair riparian-wetland functioning condition by removing portions of plants and seedlings, trampling plants, and compacting soils, and introducing noxious weeds and invasive species. The resulting impacts depend on the extent of the removal, length of grazing period, and climatic conditions. Transplanting big game species would increase the number of grazing animals; however, wildlife tends to disperse across a large area. Thus, impacts from these newly transplanted big game animals should be minor.

Impacts from Wild Horses and Burros

In general, the greater the number of burros, the greater the possibility of adverse impacts on vegetation and riparian-wetland areas because of grazing, trampling, compaction, and reduced vegetation cover. Under Alternative N, 100 AUMs are allocated to burros in the Canyonlands HMA, although no AML is established. These numbers would be the same as under Alternative A but less than under Alternative C

or D or the Proposed RMP (which establish a herd size of between 120 to 200 animals). Thus, impacts to vegetation under Alternative N would be minimal because of the small herd size managed.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs would be proposed under Alternative N, resulting in no additional protection for vegetation.

Impacts from Forestry and Woodland Products

Proposed decisions for managing forest and woodland products, based on the Healthy Forest Restoration Act, would generally improve the structure, composition, health, and vigor of forest and woodland vegetation. Alternative N allows for harvesting of forest and woodland products across most of the RFO (all areas outside of WSAs, on a case-by-case basis). Harvesting of forest and woodland products would have localized, minor-to-moderate, short-term impacts on soils because of vehicle use to access the harvesting site and because of loss of vegetative cover. Indirect effects would include reduced soil infiltration, increased erosion and sedimentation, increased soil surface temperatures, short- or long-term changes in species composition or community structure, and localized impairment of riparian-wetland functioning condition. However, removal of pinyon and juniper trees from areas in which they have invaded or areas in which canopy densities have increased would result in reduced amounts of bare ground and increased litter at the soil surface, improving vegetation cover and riparian-wetland conditions. Because pinyon pine and juniper vigorously compete with other plants for available soil water, their removal allows for regrowth of grasses and shrubs in the understory vegetation and in riparian areas.

Impacts from Livestock Grazing

Livestock grazing can directly affect vegetation communities and riparian-wetland conditions by reducing plant vigor, decreasing or eliminating desirable forage species, increasing soil instability and erosion, reducing water quantity and quality, and causing loss of or injury to individual plants from trampling, particularly near water sources. Impacts would be both short- and long-term and range from minor to major, depending upon the grazing intensity, duration, and season of use, and local climatic conditions. Long-term changes in vegetation may result if livestock use consistently exceeds established allocations or if drought or other environmental factors reduce range-carrying capacity. Improper grazing practices could lead to soil compaction, reduced infiltration rates, increased runoff and erosion, and declined riparian and watershed conditions. Livestock grazing could also increase the opportunity for exotic plant species and noxious weed infestations. Season-of-use adjustments could lessen the effects of grazing, particularly if grazing occurs during the non-growing season.

Under Alternative N, 1,989,048 acres would be available for livestock grazing and 138,952 acres would be unavailable for livestock grazing. Livestock grazing could increase soil compaction in trailing, watering, and mineral-supplement areas and could indirectly impact riparian and wetland areas and riparian functioning condition. However, livestock grazing within the RFO would be managed in keeping with applicable laws and regulations, with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration,* and with BLM's riparian policy. Adhering to these statewide standards, guidelines, and policy would minimize impacts from livestock grazing by maintaining plant vigor and increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, productivity, and riparian-wetland function. These improvements would ensure that upland soils would exhibit infiltration, permeability, and erosion rates that are appropriate to soil type, climate, and landform and that riparian areas achieve or maintain Proper Functioning Condition (PFC). Impacts therefore would be minor area-wide but potentially moderate in specific areas such as creek, springs, wetland, and riparian areas.

Construction of new range-water developments would permanently remove vegetation within the footprint of the structures. Surrounding vegetation could be damaged temporarily, but would likely recover, except in the immediate vicinity of the development. Water developments concentrate livestock use and reduce or eliminate vegetation in the immediate vicinity and increase compaction and erosion, which would lead to decreased biological productivity. Increased use of the area by livestock would increase foraging pressure on desirable species. This could result in increased or decreased vigor to the plants, depending upon the species and their phenology. Allotment scale impacts from properly planned water developments include better distribution of livestock and wildlife grazing use on the allotment, resulting in overall improvement in range conditions, increased vigor of vegetation, improved cover to soils, improved livestock performance, and reduced operational costs to permit holders. Maintenance of existing water developments would result in minor disturbance impacts to vegetation resources, similar in scope and nature to those described for new developments.

Impacts from Recreation

Recreational activities have site-specific impacts to vegetation and riparian/wetlands areas near frequent and high-use areas such as campgrounds, parking lots, trailheads, and other recreation-related use areas. Long-duration trail use (e.g., walking, equestrian, OHV, mountain biking), especially during wet periods, could result in loss of vegetation cover, could increase erosion, and could decrease the riparian ecological condition. Large group-recreation events and camping could compact soils, which could lead to changes in plant vigor and could increase erosion in riparian areas. These impacts would be site-specific and localized.

Visitor use is expected to increase throughout the RFO. Under Alternative N, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified that would limit or control recreational activities. Thus, intensively used recreation sites (such as those near Otter Creek, Big Rock, Factory Butte, Dirty Devil/Robbers Roost) would experience impacts to vegetation. Impacts to vegetation in these areas would occur from OHV use and use by large numbers of visitors in a limited space. These activities would result in loss of vegetation cover and soil compaction, as well as in a decrease in riparian ecological condition. Under Alternative N, these impacts to vegetation would continue or might even increase as visitor use increases.

Impacts from Travel Management

Generally, the more area that is open to OHV use, the greater the potential for adverse impacts to vegetation near the trails and in riparian areas. Limiting travel to designated routes would confine the impacts to areas that are already disturbed or hardened for vehicle use, particularly if sited away from riparian areas. Under Alternative N, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing potential impacts to vegetation over a large portion of the RFO. Vehicle use in riparian areas could affect riparian functioning condition by crushing vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species. Motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO; 214,000 acres (10%) of the RFO would be closed to motorized vehicle use.

Vehicles traveling on roads in the transportation system would deposit dust on roadside vegetation. This dust could lead to decreased plant vigor and increased mortality alongside the road. Dust settling on vegetation adjacent to roads would also reduce habitat suitability. Under Alternative N, 4,315 miles of unpaved routes in the RFO would be open to motorized use.

Routes within riparian areas remove and destroy riparian vegetation, increase the amount of bare soil, increase localized soil erosion, change surface hydrology, and reduce infiltration. Of all the alternatives,

Alternative N would designate routes with the greatest number of stream crossings (Table 4-13), which would result in the most impacts to riparian vegetation.

Impacts from Lands and Realty

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws would preclude future mineral location. This preclusion would reduce the potential for mining disturbance and associated impacts to vegetation and riparian conditions in these areas. However, the identified withdrawals, if established, would be subject to valid existing rights. Therefore, exploration and development impacts related to the exercise of valid existing mineral locations could occur in these areas. Alternative N proposes a total of 169,480 acres of withdrawals.

Land Tenure Adjustments (LTA) (i.e., acquiring or disposing of lands) could result in sensitive vegetative communities entering or leaving federal ownership. High-quality riparian areas are identified in the LTA criteria as areas BLM would retain or acquire, thereby increasing federal ownership of riparian areas and associated federal protection not afforded to lands in private ownership.

Impacts to vegetation resources could result from disposal of federal lands. Impacts associated with land disposals would depend upon the use of those lands by future owners. In the worst-case scenario, all vegetation would be removed from a parcel of land and the site would be paved or otherwise permanently altered to prevent future vegetation growth. This represents minor-to-moderate long-term impacts, depending upon the size and location of the parcel. Parcels that include listed threatened, endangered, or proposed species would not be identified for disposal. Identifying 280 acres as available for sale would make these lands susceptible to increased impacts to vegetation, compared with retaining the land in federal ownership, because the BLM would implement BMPs that protect the ecological health of vegetation communities in any actions it authorizes.

Impacts to vegetation resources could result from issuance of land use authorizations (e.g., ROWs, permits, leases, easements). Impacts from issuance of these authorizations would vary, based on the nature and purpose of the authorization. Impacts to vegetation and riparian areas would generally be minor to moderate and would be addressed in site-specific NEPA analysis. Under Alternative N, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas. (Exceptions would be granted only when the proposed authorization would not create substantial surface disturbance or would create only temporary impacts.) Thus, impacts to vegetation and riparian areas in these avoidance areas would be negligible-to-minor and would be localized.

Impacts from Minerals and Energy

Impacts to desert shrub, sagebrush steppe, forest and woodland, and riparian communities could result from locatable mineral development, oil and gas development, or mineral material sales and disposal. Although the actual footprint of a well pad or mine may be relatively small, production and development require additional infrastructure, such as roads and pipelines that extend beyond the development site. Mineral development activities are expected to impact vegetation communities and riparian-wetland ecosystems within the planning area because of resulting habitat modification, mortality of individual plants, and soil disturbances. Impacts associated with these actions would include loss or damage of plants because of excavation or trampling, burial under piles of waste material, toxic responses from use of chemicals in mineral extraction or waste pits, and increased exposure to dust and other contaminants associated with construction and use of access roads. Mineral development would impact riparian areas, seeps, and springs through increased runoff, by decreasing infiltration and evapotranspiration from reduction in vegetation cover and increasing the amount of impermeable surface associated with roads, structures, and compacted soil. In addition, disturbance of reclamation-limited soils could increase the

opportunity for exotic plant species and noxious weed infestations, which would impair the functioning conditions in vegetation communities and riparian areas. The severity of effects would depend on the amount of activity and the success of reclamation efforts for disturbed areas. These impacts would be associated with the estimated development of 454 wells and an associated 8,180 acres of disturbance for associated facilities and geophysical exploration on BLM lands under all alternatives, which constitutes less than 1% of BLM lands in the Planning Area. Effects from minerals management would be reduced by BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions within these areas, based on site-specific analysis. Additional Conditions of Approval (COA) could be applied to the lease terms as necessary to establish specific, necessary mitigation measures not covered by lease stipulations for resource and environmental protection.

The acreage in each leasing category would quantify impacts to vegetation in terms of acres of surface disturbance. These categories, listed from greatest to least amount of surface disturbance, are as follows: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (TL, CSU), open to leasing subject to major constraints (NSO), and closed to leasing. Generally, areas that are closed to leasing or open to leasing subject to major constraints (NSO) would experience little or no surface disturbance caused by minerals development; thus, negligible or no adverse impacts to vegetation and riparian resources would occur in these areas. Areas open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) would experience short- and long-term impacts to vegetation and riparian resources from surface disturbance associated with minerals development as described.

Leasable Minerals

Under Alternative N, 459,700 acres would be closed to leasing; 22,600 acres would be open to leasing subject to major constraints (NSO); and 1,645,700 acres would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). Withdrawing areas from mineral operations or categorizing areas as closed to leasing or open to leasing subject to moderate constraints (NSO) would prevent impacts to vegetation within those areas. (See Impacts from Lands and Realty for a discussion of withdrawals.) Exploration and development of oil and gas resources in areas open to leasing subject to moderate constraints (TL, CSU) or open to leasing subject to the standard terms and constraints could impact vegetation and riparian resources associated with the estimated development of 454 wells and the associated 8,180 acres of surface disturbance, particularly in the Sevier and Sanpete Valleys, where most of the development is expected.

Adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to vegetation and riparian resources. Under Alternative N, management actions that include permit requirements to revegetate disturbed sites and requirements for a 500-foot buffer around riparian areas would also minimize the impacts.

Locatable Minerals

Exploration and development of locatable minerals within the 1,958,520 acres of BLM land that are open to locatable mineral development (92% of the RFO) would create surface disturbances that could adversely impact vegetation and riparian resources. However, plan of operations-level development would be addressed in a site-specific environmental analysis, and notice-level activity would be regulated to prevent undue and unnecessary degradation. These actions would minimize adverse impacts associated with mineral development. Withdrawals would reduce the amount of land open to disturbance and would prevent associated impacts to vegetation and riparian resources in these areas.

Salable Minerals

Under Alternative N, 459,700 acres would be closed to disposal of mineral materials and 169,480 acres would be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts to vegetation and riparian resources within those areas. Adverse impacts to vegetation and riparian resources would occur where mineral material sales were authorized. Adherence to BMPs outlined in mining laws, plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to vegetation and riparian resources.

Managing riparian areas to preclude surface disturbance within 500 feet of riparian areas in the Cedar/Beaver/Garfield/Antimony Proposed RMP area and within 330 feet of riparian areas throughout the remainder of the RFO would minimize the impacts from surface disturbance associated with disposal of mineral materials to riparian and wetland communities.

Impacts from Special Designations

Wilderness Study Areas

Managing WSAs under the IMP would prevent most ground-disturbing activities. This prevention would result in protection for vegetation and riparian resources. However, opportunities for vegetation treatments could be limited, which would inhibit or prevent attainment of ecological objectives and desired conditions for desert shrub, sagebrush steppe, forest and woodland, and riparian communities in these areas.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect riparian vegetation by preventing ground-disturbing activities in the river corridors. All eligible segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative N. This protection would benefit riparian vegetation by limiting ground disturbance in these areas. However, opportunities for vegetation treatments could be limited, thereby inhibiting or preventing attainment of ecological objectives and desired conditions for desert shrub, sagebrush steppe, forest and woodland, and riparian communities in the river corridors.

Areas of Critical Environmental Concern

Although ACEC designation alone does not necessarily provide protection, management actions included in ACECs often are more restrictive, thus indirectly providing protection for vegetation and riparian-wetland communities. Protections associated with ACEC designation that would affect vegetation and riparian-wetland resources include managing oil and gas leasing as closed to leasing or open to leasing subject to moderate constraints (NSO), implementing more restrictive VRM designations, restricting livestock grazing, and implementing travel limitations. Alternative N continues the designation of four ACECs (14,780 acres). Vegetation was specifically identified as a relevant and important value in the North Caineville Mesa and South Caineville Mesa ACECs. Allowing no uses that would cause irreparable damage to the relevant and important values in these areas (closing to OHV use; managing as either closed to leasing or open to leasing subject to moderate constraints [NSO], depending on the ACEC; managing as unavailable for livestock grazing in three of the four ACECs; and acquiring inholdings) would reduce surface-disturbing activities within those areas and would protect vegetation and riparian-wetland resources. However, opportunities for vegetation treatments could be limited, thus inhibiting or preventing attainment of ecological objectives and desired conditions for desert shrub, sagebrush steppe, forest and woodland, and riparian communities in these areas.

Alternative A

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N. However, under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually for all treatments). No target (maximum or minimum) treatment acreage limits would be set under Alternative N. Therefore; fewer acres might be treated under that alternative during some years. However, more acres could be treated during years when numerous wildland fires occur, because the 2005 Land Use Plan Amendment for Fire and Fuels Management allows the full range of fire and fuels management actions to achieve ecosystem sustainability. Alternative A allows for the treatment of vegetation by using a full range of treatment types (including mechanical, wildland fire use or prescribed fire, and chemical methods). Additionally, full suppression of wildland fires is not mandated under Alternative A; this decision would reduce pinyon-juniper encroachment and decrease the risk of large or intense wildfires. Thus, impacts to vegetation and riparian-wetland resources under Alternative A would likely result in increased short-term impacts (altered vegetation structure) compared to Alternative N but decreased long-term impacts (improved vegetative cover and increased plant diversity, resulting in stabilized soil, improved overall watershed function and condition, and greater infiltration and soil moisture storage).

Impacts from Visual Resources

The types of impacts experienced as a result of VRM would be similar to those described under Alternative N. Under Alternative A, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 0 acres would be designated as VRM Class II; 392,800 acres (18%) would be designated as VRM Class III; and 1,288,300 acres (61%) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate-to-major modifications in the existing character of the landscape and could allow the greatest flexibility for vegetation treatments. This design would allow for increased short-term impacts to vegetation but could also result in long-term improvement in ecological condition of treated areas.

Impacts from Special Status Species

The types of impacts experienced as a result of SSS management would be similar to those described under Alternative N. However, Alternative A includes additional strategies (including employing directional drilling for oil and gas, closing and reclaiming roads, mitigating the effects of proposed projects that have the potential to cause long-term or permanent impacts or loss of habitat, and using species-specific buffers for surface-disturbing activities) to avoid or reduce fragmenting habitat. All these actions would benefit vegetation and riparian-wetland resources by reducing surface disturbance and by reducing the potential for invasion and spread of invasive species.

Impacts from Fish and Wildlife

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under Alternative N. However, Alternative A proposes restricting surface disturbance or surface occupancy within 330 feet of riparian areas (versus within 500 feet of riparian areas in the Cedar/Beaver/Garfield/Antimony Proposed RMP area and within 330 feet of riparian areas throughout the remainder of the RFO for Alternative N) and includes fewer restrictions on OHV use in crucial wildlife habitats. These management actions would increase the potential for degradation of riparian and upland habitats, as well as the potential for the spread of invasive species under Alternative A.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside WSAs are proposed under Alternative A, resulting in no additional protection for vegetation.

Impacts from Forestry and Woodland Products

Alternative A allows for harvesting of forest and woodland products across most of the RFO (all areas, outside of WSAs) when sustainable and compatible with restoring, maintaining, or improving forest health. Although the impacts would be similar to those described for Alternative N, Alternative A includes objectives to emphasize woodland health. Harvesting of forest and woodland products would involve vehicle use to access the harvesting site and loss of vegetative cover, thus resulting in localized, minor-to-moderate impacts on vegetation and riparian-wetland resources. Indirect effects could include short- or long-term changes in species composition or community structure as well as increased erosion and decreased riparian functioning condition. However, removal of pinyon and juniper trees from areas in which they have invaded or areas in which canopy densities would have increased results in reduced amounts of bare ground and increased litter at the soil surface. Because pinyon pine and juniper vigorously compete with other plants for available soil water, their removal allows for regrowth of grasses and shrubs in the understory vegetation. This regrowth acts as a protective vegetative cover for the soil surface, resulting in decreased erosion and improved ecological condition of the plant community. Thus, management of forestry and woodland products under Alternative A would have beneficial impacts to vegetation, compared to Alternative N.

Improvement in the ecological condition of forests and woodlands could also improve riparian-wetland function by improving soil stability, reducing excessive runoff, and increasing infiltration of water into root systems that could indirectly benefit riparian resources. However, because areas in which forest and woodland products tend to be harvested are generally not riparian areas, the overall effects of forestry and woodlands decisions on riparian resources would be negligible.

Impacts from Livestock Grazing

The types of impacts experienced as a result of livestock grazing management would be similar to those described under Alternative N. Under Alternative A, 102,002 acres would be unavailable to livestock grazing, and 2,025,998 acres would be available for grazing. Although livestock grazing could increase soil compaction in trailing, watering, and mineral-supplement areas and could indirectly impact riparian-wetland areas and riparian functioning condition, grazing within the RFO would be managed in keeping with applicable laws and regulations, the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration,* and BLM's Utah Riparian Policy. Adhering to these statewide standards, guidelines, and policy would minimize impacts from livestock grazing by maintaining plant vigor and increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, productivity, and riparian-wetland function. This would ensure that upland soils would exhibit infiltration, permeability, and erosion rates that are appropriate to soil type, climate, and landform and would ensure that riparian areas achieve or maintain proper functioning condition. Therefore, impacts would be minor area-wide but could be moderate in specific areas, such as in riparian areas.

Impacts from Recreation

Under Alternative A, five SRMAs (514,500 acres) would be established to manage recreational use and to mitigate the impacts caused by this use, such as uncontrolled camping, parking, and other activities. Limiting OHV use in the Otter Creek Reservoir SRMA to designated routes would maintain existing soil,

water, and riparian resource conditions by concentrating impacts to already disturbed areas and by reducing the extent of soil compaction. Maintaining the existing condition of riparian-wetland areas would reduce soil erosion. Reducing the extent of soil compaction would indirectly maintain existing infiltration and soil-water distribution patterns.

The construction of recreation facilities in the Big Rock SRMA could have localized, adverse, short-term impacts caused by removal of vegetation in those areas. However, long-term impacts would be beneficial by concentrating use areas and thus limiting the extent of vegetation disturbance. Managing the Dirty Devil/Robbers Roost SRMA (290,000 acres) for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for vegetation disturbance from recreation. Limiting OHV recreation use in the Dirty Devil/Robbers Roost SRMA to designated routes would reduce potential surface disturbance and localized removal of vegetation. Managing the Sahara Sands SRMA (12,300 acres) for a roaded natural recreational opportunity and the development of facilities would have site-specific impacts, including soil compaction, changes in surface hydrology, and increased runoff. Managing the Factory Butte SRMA (199,700 acres) for a motorized recreational opportunity and allowing moderate-to-extensive landscape modification would have potentially major impacts by eliminating vegetation or altering plant communities (reducing species diversity or increasing the potential for introduction and spread of invasive species) over a relatively large area.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative A designates 449,000 acres (21%) of the RFO as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; and 0 acres would be closed to motorized vehicle use. The amount of open areas, although greatly reduced compared to Alternative N, would still result in impacts to vegetation from vehicle use in those areas.

The remainder of the RFO would limit motorized use to designated routes, therefore limiting potential impacts to vegetation occurring in the immediate vicinity of the route. The public would have access to 4,312 miles of unpaved routes (essentially the same as Alternative N); 68 miles of routes would be closed, allowing these areas to revegetate. No areas would be closed to motorized use, with no accompanying benefits to vegetation.

Vehicle use in riparian areas could affect riparian functioning condition by crushing vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species. Alternative A would designate routes with 443 stream crossings (Table 4-13), the second-most crossings of all the alternatives.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty would be similar to those described under Alternative N, although impacts to vegetation could occur over a larger area because fewer acres would be proposed for withdrawal (154,700 acres under Alternative A), more acres would be proposed for disposal (13,400 acres), and fewer ROW avoidance areas (446,900 acres closed to leasing) would be proposed. Thus, impacts to vegetation from surface-disturbing activities would be greater under Alternative A than under Alternative N.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy would be similar to those described under Alternative N. Development of oil and gas resources could affect vegetation because of the surface disturbances associated with such development. However, adherence to BMPs outlined in mining laws,

plans of operation, pertinent restrictions, and standard terms and conditions would help minimize impacts to vegetation and riparian-wetland resources. Closing or withdrawing areas from mineral operations would prevent impacts to vegetation and riparian-wetland resources within those areas. (See Impacts from Lands and Realty for a discussion of withdrawals.) Alternative A proposes fewer acres of mineral withdrawals (154,700 acres), fewer areas closed to leasing and closed to disposal of mineral materials (446,900 acres), and fewer areas open to leasing subject to major constraints (NSO) (0 acres), thereby providing less protection to vegetation and riparian-wetland resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible river segments would be recommended as suitable. No special management to protect the outstandingly remarkable values of these rivers would be provided, so WSR designation would not apply to riparian vegetation within these corridors and such vegetation would not be protected from ground-disturbing activities. Opportunities for vegetation treatments would not be restricted, which could assist in attaining ecological objectives and desired conditions in the river corridors. However, most of the eligible river segments (98 of the 135 miles total) are also within WSAs. Consequently, none of the described ground-disturbing activities would occur in those river corridors.

Areas of Critical Environmental Concern

Alternative A designates no ACECs, so no special management to protect desert shrub, sagebrush steppe, forest and woodland, and riparian communities (including vegetation in the North Caineville Mesa and South Caineville Mesa potential ACECs, which was specifically identified as a relevant and important value in those areas) is proposed. Allowing uses that would cause irreparable damage to the relevant and important values in these areas could result in surface-disturbing activities that could impact vegetation resources within those areas. However, opportunities for vegetation treatments would not be limited, which would assist in attaining ecological objectives and desired conditions in these areas.

Proposed RMP

Impacts from Soil Resources

Impacts would be similar to those described under Alternative N. However, new BMPs would improve soil conditions.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative A, except allowing temporary non-renewable use of targeted livestock grazing to reduce site-specific fuels or noxious and invasive weeds could maintain or improve upland vegetation conditions and reduce cheatgrass and other invasive weeds. In forests and woodlands, this action would reduce fuel loads and noxious and invasive weeds, leading to improved health of these communities.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under the Proposed RMP, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 249,800 acres (12%) would be managed as VRM Class II; 393,100 acres (18%) would be managed as VRM Class III; and 1,038,200 acres (49%) would be managed as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of

moderate-to-major modifications in the existing character of the landscape and could allow the greatest flexibility for vegetation treatments. However, less of the RFO would be designated in these VRM classes than under Alternative N or A, resulting in less potential short-term impacts to vegetation and less long-term improvement in ecological condition of degraded areas, compared to those alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts to vegetation under the Proposed RMP would be similar to those described under Alternative A. However, the Proposed RMP would restrict surface disturbance or surface occupancy within the 100-year floodplain or 330 feet of riparian areas, whichever is greater (versus 330 feet for Alternative A). This alternative also proposes temporal (winter and/or spring, depending on species) restrictions on surface-disturbing activities (to protect wildlife during critical life stages) and restricts OHV use in deer and elk crucial habitats. The management actions would also benefit vegetation by limiting activities during wet seasons (which would reduce soil compaction and could reduce plant vigor) and by restricting activities that could result in vegetation loss.

Impacts from Wild Horses and Burros

Under the Proposed RMP, 600 AUMs are allocated to burros in the Canyonlands HMA, to meet an AML upper limit of 100. These numbers are greater than either Alternative N or A but fewer than DRMP/DEIS Alternative C or D (which establish a herd size of between 120 to 200 head). Because more burros result in a greater possibility of adverse impacts to vegetation because of trampling and reduced vegetation cover, the Proposed RMP would potentially impact vegetation more than DRMP/DEIS Alternative N or A but less than DRMP/DEIS Alternative C or D.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres would be managed to maintain wilderness characteristics. Management actions would include the following: designating the areas as closed to leasing or open to leasing subject to major constraints (NSO), restricting OHV use to designated routes; and designating the areas as VRM Class II. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize direct impacts from surface-disturbing activities to vegetation. The management prescriptions, specifically managing as VRM Class II, could also limit options of managing vegetation. The results would be less long-term improvement in the ecological condition of degraded areas, compared to DRMP/DEIS Alternatives N, A, or C because opportunities to perform vegetation treatments would be limited in their methods. However, these areas would be available for healthy lands initiative projects, which would reduce the magnitude of this impact, compared to Alternative D. This impact would be most pronounced in the Ragged Mountain, Mount Pennell, and Mount Ellen—Blue Hills, non-WSA lands in which vegetation treatments could be needed to improve buffalo habitat. Vegetation treatments could be completed using only fire or biological treatment methods, which may not obtain the results being sought for habitat manipulation in a timely manner.

The remainder of the non-WSA lands with Wilderness Characteristics (604,000 acres) would be managed according to other resource decisions of the Proposed RMP. Impacts would be the same as described under DRMP/DEIS Alternative A.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forestry and woodlands management would be similar to those described under DRMP/DEIS Alternative A, although more lands would be closed to this type of use under the Proposed RMP (one WSR segment –5 miles, compared to zero segments under Alternative

A). Thus, localized disturbance to vegetation and changes in vegetation community composition and structure would be less under the Proposed RMP than under Alternative A.

Impacts from Livestock Grazing

The types of impacts experienced as a result of livestock grazing decisions would be similar to those described under Alternative A, although less land would be available for grazing under the Proposed RMP (1,989,048 acres, compared to 2,025,998 acres under Alternative A). Livestock grazing would be managed in keeping with applicable laws and regulations the *Fundamentals of Rangeland Health*, and *Standards and Guidelines for Grazing Administration,* and BLM's Utah Riparian Policy. Therefore, impacts from livestock grazing would be minimized by maintaining plant vigor and by increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, productivity, and riparian-wetland function. Impacts would be minor area-wide but potentially moderate in specific areas such as riparian areas, although the difference between alternatives is negligible.

Impacts from Recreation

Under the Proposed RMP, five SRMAs (860,390 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Limiting OHV use to designated routes would maintain existing soil, water, and riparian resource conditions by concentrating impacts to already disturbed areas and by reducing the extent of soil compaction. Maintaining the existing condition of riparian-wetland areas would reduce soil erosion. Reducing the extent of soil compaction would indirectly maintain existing infiltration and soil-water distribution patterns.

Establishing a Factory Butte SRMA would limit the impacts of cross-country OHV use on vegetation to a 8,500 acre area. Construction of facilities in the Big Rock SRMA would have localized, adverse impacts caused by removing of vegetation in those areas; long-term impacts would be beneficial by concentrating use areas and thus limiting the extent of vegetation disturbance. Managing the Dirty Devil/Robbers Roost SRMA (290,500 acres) for primitive and semi-primitive recreation would reduce the potential for surface disturbance and localized vegetation removal caused by recreation. Closing canyons within the Dirty Devil/Robbers Roost SRMA to OHV recreation use and limiting OHV recreation use to designated routes would reduce potential impacts to vegetation. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities would have localized, adverse impacts caused by removal of vegetation in those areas; long-term impacts would be beneficial by concentrating use areas and thus limiting the extent of vegetation disturbance. Managing the Henry Mountains SRMA for primitive and semi-primitive recreation would indirectly maintain or reduce the potential for soil disturbance.

The Proposed RMP establishes more areas as SRMAs than does Alternative N or A but fewer areas than does Alternative C or D. Therefore, the Proposed RMP would provide more protection to vegetation as a result of recreation decisions than would Alternative N or A and would provide less protection than would Alternative C or D.

Impacts from Travel Management

The Proposed RMP designates only 9,890 acres (less than 1% of the RFO) as open to motorized vehicles, thereby minimizing direct impacts to vegetation, as a result of vehicles trampling plants. The amount of open areas, although greatly reduced compared to Alternative N, would result in direct and indirect impacts that vehicle use in those areas would cause to vegetation. The absence of vehicle use in riparian areas would benefit riparian functioning condition, by eliminating vehicles crushing vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species.

The Proposed RMP would close 209,900 acres (10% of the RFO) to motorized use, thereby eliminating all impacts that vehicles driving over plants and depositing dust on individual plants could cause to vegetation. This restriction would allow for revegetation and increased plant vigor in closed areas that had previously been open or limited.

The remainder of the RFO (1,908,210 acres) would limit motorized use to designated routes, thereby limiting potential impacts to vegetation in the immediate vicinity of the route. The public would have access to 4,277 miles of unpaved routes (slightly less than under Alternative N); 345 miles of routes would be closed (more than double the amount closed under Alternative N), allowing these areas to revegetate.

Vehicle use in riparian areas could affect riparian functioning condition by crushing vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species. The Proposed RMP would designate routes with 400 stream crossings (Table 4-13)—fewer than under Alternative N or A but more than under Alternative C or D.

Impacts from Lands and Realty

Impacts to vegetation would occur over a smaller area than in Alternative N. Impacts to vegetation would occur over a smaller area than Alternative N because more acres would be proposed for withdrawal (176,200 acres under the Proposed RMP) and more acres would be designated ROW avoidance areas (630,600 acres closed to leasing or open to leasing subject to major constraints [NSO], one suitable WSR segment—5 miles, and two ACECs—2,530 acres). Thus, impacts to vegetation and riparian resources because of surface-disturbing activities would be less under the Proposed RMP than under Alternative N.

Impacts from Minerals and Energy

The types of impacts that would result from minerals and energy decisions would be similar to those described under Alternative N. However, the Proposed RMP proposes more acres of mineral withdrawals (176,200 acres) than does Alternative N or A. These withdrawals would preclude mineral and energy development in those areas and thus allow less disturbance to vegetation and riparian resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect vegetation and riparian resources by preventing ground-disturbing activities in the river corridors. One suitable segment (5 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and wild classification under the Proposed RMP. This management would benefit riparian vegetation by limiting ground disturbance in the area, although opportunities for vegetation treatments could be limited, thereby inhibiting or preventing attainment of ecological objectives and desired conditions in these river corridors.

Of the remaining segments not being carried forward into the Proposed RMP, 98 miles are within WSAs, which are managed under the IMP and are consequently mostly protected from surface disturbing activities, leaving 32 miles on which ground-disturbing activities could potentially impact vegetation. The Proposed RMP would provide less protection to vegetation from WSR decisions than would Alternative N, C, or D but would provide more protection than would Alternative A.

Areas of Critical Environmental Concern

The Proposed RMP designates two ACECs (2,530 acres). Vegetation was specifically identified as a relevant and important value in the North Caineville Mesa and Old Woman Front ACECs. Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within those areas, thereby protecting vegetation and riparian resources and R and I values. Restrictions could include closing the areas to OHV use; managing the areas as open to leasing subject to major constraints (NSO), depending on the ACEC; making the areas unavailable for livestock grazing; and acquiring inholdings.

Alternative C

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A. However, under Alternative C, fewer acres would be treated annually (averaging 26,000 annually for all treatments). In addition, Alternative C proposes only treatment methods that mimic natural processes to manage vegetation. Such methods could be less effective than conventional vegetation treatments and would not be effective in all vegetation and riparian-wetland communities. The result could be the loss of existing vegetation cover, indirectly decreasing the ecological condition of the treated area. Control of some invasive species could also be difficult because of lack of suitable substitute treatments, possibly allowing the spread of invasive species and displacement of desirable vegetation (using fire as a control tool for invasive species, including tamarisk, could increase the growth and spread of these species). Thus, impacts to vegetation and riparian-wetland resources under Alternative C would likely result in less short-term impacts (altered vegetation structure) but more long-term impacts (reduced vegetative cover and plant diversity) than under Alternative A.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative C, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 230,600 acres (11%) would be designated as VRM Class II; 509,100 acres (24%) would be designated as VRM Class III; and 941,400 acres (44%) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate-to-major modifications in the existing character of the landscape and could allow greater flexibility for vegetation treatments. However, less of the RFO would be designated in these VRM classes than under Alternative N or A or the Proposed RMP, resulting in less potential short-term impacts to vegetation and riparian resources and less long-term improvement in ecological condition of degraded areas, compared to those alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under Alternative A. However, Alternative C proposes restricting surface disturbance or surface occupancy within 660 feet of riparian areas (versus 330 feet for Alternative A), includes more restrictions on OHV use in wildlife habitats, and designates an ACEC in the Henry Mountains (288,200 acres) for the

protection of wildlife values. These additional management actions would decrease the potential for impacts to vegetation and would increase protection for riparian vegetation under this alternative.

Impacts from Wild Horses and Burros

Under Alternative C, 1,200 AUMs are allocated to burros in the Canyonlands HMA to meet an AML upper limit of 200. These numbers are greater than under Alternative N or A or the Proposed RMP. Because more burros result in a greater possibility of adverse impacts on vegetation because of trampling, compaction, and reduced vegetation cover, Alternative C would potentially impact vegetation more than would Alternative N or A or the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for vegetation.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forestry and woodlands management would be similar to the Proposed RMP, although more lands (12 WSR segments—135 miles) would be closed to this type of use under Alternative C. Thus, localized disturbance to vegetation and changes in vegetation community composition and structure would be reduced under this alternative, compared to the Proposed RMP.

Impacts from Livestock Grazing

Impacts would be the same as those described under the Proposed RMP.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under the Proposed RMP. Under Alternative C, four SRMAs (930,000 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. No SRMAs would be established for OHV recreation; thereby eliminating impacts that cross-country OHV use could cause to vegetation. All SRMAs would be established to provide for primitive or semi-primitive recreation opportunities. OHV use would be limited to designated routes, and facilities would either not be provided or would be the minimal necessary. These management prescriptions would reduce the potential for surface disturbance and localized vegetation removal caused by recreation and would benefit riparian functioning condition by eliminating vehicles that could crush vegetation, compact soils, erode streambanks, increase sediment in streams, and spread invasive species.

Alternative C would establish more areas as SRMAs than would Alternative N or A or the Proposed RMP but fewer areas than would Alternative D. Therefore, Alternative C would provide more protection to vegetation as a result of recreation decisions than would Alternative N or A or the Proposed RMP and less protection than would Alternative D.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under the Proposed RMP. However, Alternative C designates no areas as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,445,000 acres (68%) of the RFO; and 683,000 acres (32%) would be closed to motorized vehicle use. The lack of open areas would eliminate impacts that vehicle use in those areas could cause to vegetation.

Limiting motorized use to designated routes—the public would have access to 3,192 miles of unpaved routes—would limit impacts to vegetation to areas in the immediate vicinity of the designated route;

1,188 miles of routes would be closed, allowing these areas to revegetate. Prohibiting construction of new routes in riparian areas would provide additional protection for riparian resources by precluding new disturbance (crushing of vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species) in these areas.

Vehicle use in riparian areas could affect riparian functioning condition by crushing vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species. Alternative C would designate routes with 273 stream crossings (Table 4-13), the second most crossings under all the alternatives and only slightly more than under Alternative D.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty decisions would be similar to those described under Alternative N. However, impacts to vegetation could occur over a much smaller area because more acres would be proposed for withdrawal (331,100 acres under Alternative C) and more acres would be designated ROW avoidance areas (735,000 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments, and 16 ACECs). Thus, impacts to vegetation and riparian resources from surface-disturbing activities would be less under this alternative than under Alternative N.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy decisions would be similar to those described under Alternative N. However, Alternative C proposes more acres of mineral withdrawals (331,100 acres), compared to Alternative N or A or the Proposed RMP. These withdrawals would preclude mineral and energy development in those areas and thus reduce disturbance to vegetation and riparian resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect vegetation by preventing ground-disturbing activities in the river corridors. Under Alternative C, 12 suitable segments (135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. This management would benefit riparian vegetation by limiting ground disturbance in these areas. However, opportunities for vegetation treatments could be limited, which could inhibit or prevent attainment of ecological objectives and desired conditions in these river corridors.

Areas of Critical Environmental Concern

Alternative C designates 16 ACECs (886,810 acres). Vegetation was specifically identified as a relevant and important value in the North Caineville Mesa and South Caineville Mesa ACECs, and vegetation management was identified as a management prescription in the Henry Mountains ACEC to provide improved habitat for bison and mule deer, both identified as relevant and important values. Allowing no uses that would cause irreparable damage to the relevant and important values in these areas (all ACECs except for the Henry Mountains) would reduce surface-disturbing activities within those areas, thus protecting vegetation and improving the ecological condition of riparian areas. Restrictions could include closing the areas to OHV use; managing the areas as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; designating the areas as VRM Class II; making the areas unavailable for livestock grazing or fencing riparian areas in ACECs where grazing occurs; and

acquiring inholdings. However, opportunities for vegetation treatments could be limited, which could inhibit or prevent attainment of ecological objectives and desired conditions in these areas.

Alternative D

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. However, these impacts would occur over a much smaller area because of differences in VRM class designations between the two alternatives. Under Alternative D, 1,129,600 acres (53% of the lands managed by the RFO) would be designated as VRM Class I; 66,700 acres (3%) would be designated as VRM Class II; 355,100 acres (17%) would be designated as VRM Class III; and 576,600 acres (27%) would be designated as VRM Class IV. Just more than one-half of the RFO would be designated as VRM Class I or II, meaning that the existing character of the landscape must be preserved or retained. Thus, surface-disturbing activities would generally not be allowed in these areas, resulting in restrictions on treating vegetation even in areas in which ecological condition has been degraded. Therefore, Alternative D would result in less potential for wind and water erosion and sedimentation to streams, as well as less potential short-term impacts to vegetation and less long-term improvement in ecological condition of degraded areas, compared to Alternative N, A, or C or the Proposed RMP.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative C.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres would be managed to maintain wilderness characteristics. Management actions to achieve this would include the following: designating the areas as closed to leasing; closing the area to OHV use; and designating the area as VRM Class I. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize direct impacts that surface-disturbing activities could cause to vegetation. It could also limit options of managing vegetation, which could result in less long-term improvement in ecological condition of degraded areas, compared to Alternatives N, A, or C or the Proposed RMP, because opportunities to perform vegetation treatments would be very limited in their methods. This would be especially true in the Kingston Ridge, Limestone Cliffs, and Wildcat Knolls non-WSA areas in which vegetation manipulations could be needed to improve deer and elk habitat, as well as in the Ragged Mountain, Mount Pennell, Mount Ellen—Blue Hills, Pole Canyon, Mount Hillers, and Bull Mountain non-WSA lands, in which vegetation treatments could be needed to improve buffalo habitat. Vegetation treatments could be completed only by using fire or biological treatment methods, which may not obtain the results being sought for habitat manipulation in a timely manner.

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative C, except that no commercial or non-commercial forest and woodland products would be allowed within the 682,600 acres of non-WSA lands with wilderness characteristics. Thus, localized surface disturbance and changes in vegetation community composition and structure would be greatly reduced under Alternative D, compared to all the other alternatives.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative C.

Impacts from Recreation

Under Alternative D, seven SRMAs (1,358,100 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Managing these SRMAs for dispersed recreation in a primitive or semi-primitive setting would indirectly maintain or reduce the potential for surface disturbance caused by recreation. Associated management actions (closing or limiting the area for OHV use and precluding development of facilities) would minimize the potential for surface disturbance and localized removal of vegetation because of recreation and would benefit riparian functioning condition by eliminating vehicles that could crush vegetation, compact soils, erode streambanks, increase sediment in streams, and spread invasive species.

Alternative D, which establishes more areas as SRMAs than any other alternative, would provide the most protection to vegetation and riparian-wetland areas.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. However, Alternative D designates 972,800 acres (46% of the RFO) as limited to designated routes and 1,155,200 acres (54%) as closed to motorized vehicle use. The lack of open areas would eliminate impacts to vegetation from vehicle use in those areas. Limiting motorized use to designated routes—the public would have access to 3,043 miles of unpaved routes—would generally limit impacts to vegetation to areas in the immediate vicinity of the designated route; 1,242 miles of routes would be closed (the most under any alternative), allowing these areas to revegetate.

Vehicle use in riparian areas could affect riparian functioning condition by crushing vegetation, compacting soils, eroding streambanks, increasing sediment in streams, and spreading invasive species. Alternative D would designate routes with 266 stream crossings (Table 4-13), the least crossings under all the alternatives.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty management would be similar to those described under Alternative N, although impacts to vegetation would occur over a much smaller area because more acres would be proposed for withdrawal (903,900 acres under Alternative D) and more acres would be designated ROW avoidance areas (1,203,800 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments, and 16 ACECs). Thus, impacts to vegetation from surface-disturbing activities would be much less under Alternative D than under all the other alternatives.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy would be similar to those described under Alternative N. However, impacts to vegetation would occur over a much smaller area because more acres would be proposed for withdrawal (903,900 acres under Alternative D) and more areas would be

closed to leasing or open to leasing subject to major constraints (NSO) (1,203,800 acres). Closing or withdrawing areas from mineral operations would prevent impacts to vegetation and riparian resources within those areas. Thus, impacts to vegetation and riparian resources from mining-related, surface-disturbing activities would be much less under Alternative D than under all the other alternatives.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.3.5 Cultural Resources

This section presents potential impacts that the alternatives could have on cultural resources, as determined through changes in or access to the resources. Cultural resources specifically include archaeological resources, historical resources, and resources of importance to Native Americans. The locations of most cultural resource sites in the Planning Area are not known. See Chapter 3 for a discussion of cultural resources in the RFO. The required consultations for Section 106 of the National Historic Preservation Act (NHPA) are in progress and will be completed prior to signature of the Record of Decision (ROD). The BLM has forwarded to the SHPO a determination that, although in some cases, management actions in this plan may have a potential to affect historic properties, there would be no adverse affect to these historic properties.

Archaeological and historical resources may be impacted by unauthorized collection and excavation, vandalism, erosion, trampling, OHV use, fire, soil compaction, and mechanized surface disturbance. Indirect impacts may cause surface disturbance that allows subsequent soil erosion and undermining of sites and structures. Indirect impacts may also allow access or lack of access for vandalism. In addition, resources of importance to Native Americans may be impacted by unauthorized collection, vandalism, erosion, trampling, OHV use, fire, mechanized surface disturbance, and loss of access to sacred or traditional use areas. These impacts affect the artifacts, features, and architecture that make up these sites, in ways that reduce their integrity, scramble their context, alter their connection to traditional values, decrease their research potential, and ultimately affect a site's eligibility for placement on the National Register of Historic Places (NRHP). Archaeological data consist of "objects" (artifacts, features, and architecture) and the spatial relationships (context) between objects. The ability to interpret and understand the past is based on both of these things. Surface and subsurface disturbances can destroy both the "objects" as well as their spatial relationships and therefore any interpretation and understanding that derives from them. Impacts from surface disturbance can not only affect the setting and physical integrity of sites and areas but can also diminish the interpretive value of those sites and areas. In general, impacts that surface disturbance cause to cultural resources are long-term in nature; once a site has been impacted, the effect typically cannot be reversed.

Current BLM policy is to categorize cultural resources according to their potential or best use. The six use categories outlined in the BLM 8110 manual recognize a greater degree of uses that different kinds of sites may be put to or objectives they may serve. The six categories are as follows:

- Scientific Use
- Conservation for Future Use
- Traditional Use
- Public Use
- Experimental Use
- Discharged from Management

In addition to providing clear management direction for specific classes of sites, allocation of cultural resources to these use categories also allows land managers to address the values of cultural resources before they are threatened by an undertaking.

4.3.5.1 Native American Religious Concerns

This section also discusses impacts to Native American religious concerns, from actions either implemented or authorized by BLM. All federal agencies must consider two major issues relating to Native Americans: 1) traditional cultural properties and 2) sacred sites.

A traditional cultural property (TCP) is a property that possesses traditional cultural significance derived from the role that the property plays in a group's historically rooted beliefs, customs, and practices. There are various types of TCPs, but those of concern to Native American coordination efforts are typically 1) locations associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world; or 2) locations to which Native American religious practitioners have historically gone, and may still go, to perform traditional ceremonial activities. A TCP is a property that is eligible for inclusion in the NRHP because of its association with cultural practices or beliefs of a living community that 1) are rooted in that community's history and 2) are important in maintaining the continuing cultural identity of the community.

Sacred sites are defined in Executive Order 13007, Indian Sacred Sites, as "any specific, discrete, narrowly delineated location on Federal land that is identified by an Indian tribe, or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion; provided that the tribe or appropriately authoritative representative of an Indian religion has informed the agency of the existence of such a site." This appears to be a very limiting definition, but sacred sites can and do consist of a variety of places and landscapes (e.g., springs, mountains, caves, archaeological sites). Some of the better known sites are the Sweetgrass Hills in Montana, the San Francisco Peaks in Arizona, and the Medicine Wheel in the Bighorn Mountains of Wyoming.

The Executive Order requires that sacred sites must be identified as such either by a Native American tribe or by a Native American individual whom the tribe has named as the appropriately authoritative representative of its religion. The important point here is that the Federal Government has no role in the identification or validation of sacred sites. The sovereign-government-to-sovereign-government nature of consultation between Native American tribes and the Federal Government dictates that the determination of sacred sites is a Native American role. The tribes may or may not choose to disclose the qualities that contribute to the sacred nature of a site but, regardless of their choice, there is no review of such determinations by a federal agency.

Sacred sites generally fall under a completely different set of criteria than TCPs. A big difference between TCPs and sacred sites is that TCPs are a Section 106 issue with protection afforded by compliance with that section of the NHPA. Section 106 compliance involves detailed review by the State Historic Preservation Officer (SHPO) and, if need be, the Advisory Council on Historic Preservation. Sacred sites are not subject to such review. Sacred sites are a NEPA issue and must be treated carefully in any land-use planning and decision-making. However, even this distinction can be blurred in the case of the sacred site that meets certain NRHP eligibility criteria and also qualifies as a TCP. In such cases, sacred sites are subject to Section 106 compliance.

In addition to the NEPA requirements, Executive Order (EO) 13007 requires federal land management agencies to accommodate access to and ceremonial use of Native American sacred sites by Native American religious practitioners and to avoid adversely affecting the physical integrity of such sacred sites. EO 13007 also requires agencies to develop procedures for reasonable notification of proposed actions or land management policies that may restrict access to or ceremonial use of sacred sites or that may adversely affect sacred sites.

Impacts and Mitigation

Mitigation of impacts to Native American religious concerns is an entirely different matter than the treatment of threatened cultural resources. From the perspective of traditional religious practitioners, a particular area could be regarded as a hallowed place, perhaps devoted to or having been the scene of special religious rites and ceremonies. Practitioners and believers might perceive any secular use or development in such a place to be injurious to its exceptional sacred qualities or to be a sacrilege and

therefore unacceptable. The BLM manager might be put in the position of having to weigh a proposal for a legally and politically supported use, such as mineral development, in an area regarded as sacred and inviolate. Therefore, the participation of tribes in the environmental analysis process is both encouraged and invited so that such concerns might be made known. Mitigation strategies designed to reduce or eliminate impacts of proposed undertakings generally follow models related to NEPA and NHPA and their implementing regulations. In the case of NHPA, these mitigation strategies generally consist of avoiding the resource, redesigning the project, or otherwise safeguarding what makes the historic resource important, before it succumbs to project implementation. However, these conventional methods of mitigation generally do not appropriately address the consequences to Native American cultural and religious concerns.

Some traditional mitigation strategies used by federal agencies could work with Native American issues, if those issues are tangible in nature. For example, a BLM proposal might be modified to allow for continuing traditional resource use by Native Americans, or that traditional use might be moved outside the area affected by the project, if the use by Native Americans is flexible. Access to a sacred site, as well as the site itself, may be closed to everyone but Native Americans for a certain time. Accommodating ceremonial use may mean assuring privacy. Both sides can be flexible in such cases. In contrast, the abstract, non-resource issues surrounding belief and practice are a much different matter. There is no appropriate mitigation that could be applied to something as intangible as a belief system.

Any protection afforded these special places requires that the federal land manager know where the places are so that protective measures can be implemented. This knowledge often becomes an issue in itself because the relationship between Native American tribes and the Federal Government has never caused Native Americans to want to reveal or entrust sacred concerns to federal officials. Because almost any action taken by this agency could affect both tangible and intangible Native American concerns in some way, it becomes BLM's responsibility to identify those concerns and deal with them appropriately. That situation would remain the same regardless of the management alternative chosen. A Memorandum of Understanding (MOU) between the BLM and the Paiute Indian Tribe of Utah was signed in 1998 and deals with coordination between the two entities, including outlining the coordination process, the tribal area of interest, types of projects the tribe is interested in, and the resolution of any issues that may arise during consultation. This MOU marks substantial progress towards the identification and resolution of these sensitive issues. The BLM proposes to enter into agreements, formally or informally, with all tribes interested in dealing with the RFO. This should make consultation efforts for the RFO both meaningful and productive. Any agreements which are developed could affect future management as Native American concerns are addressed.

Only two areas that have special significance to Native American tribes have been identified in the RFO to date: Quitchupah Canyon in Sevier and Emery Counties (held sacred by the Paiute Indian Tribe of Utah) and the Henry Mountains of Wayne and Garfield Counties (held sacred by the Navajo Nation). Other concerns to date have been restricted to smaller areas and individual cultural resource sites discovered during the normal field-inventory process. All these sites would be considered carefully in future project planning. Tribes would continue to be consulted about these resources and how they should be managed to eliminate or mitigate impacts.

Throughout the land use planning process, the BLM has consulted with several tribes. Information on this process is contained in Chapter 5. During consultation communications, issues and concerns were raised regarding many of the proposals discussed in this Proposed RMP. Other issues included the following:

- Generally, the tribes supported the conservation of all resources. The tribes would prefer to see all cultural sites left in their existing states and not be subjected to disturbance from any proposed action.

- Federal land managers should consider and be sensitive to Native American religious concerns and beliefs while implementing mandated multiple-use policies.

- Several tribes generally oppose oil, gas, and mineral development because digging up the earth for any reason negatively affects all living beings.

- Many Native Americans feel that OHV users are not meeting nature on its own terms and are thereby limiting the experience because of the introduction of the artificial OHV into natural settings. Some Native American concerns on OHVs include the following:
  - OHV use can cause considerable adverse effects to the natural and cultural resources.
  - OHV use can disturb, modify, or decrease vegetation cover, making areas more susceptible to flooding and erosion.
  - OHV use can result in vandalism to cultural resources. Those archaeological sites that remain in good condition are that way primarily because of their isolation and limited access. It has been demonstrated that increased access results in increased destruction of those cultural resources that are a very real part of Native American culture and religion.
  - The transportation plan must include a real commitment to law enforcement so that any claim that OHVs are limited to existing roads and trails has some meaning.

– OHV use on the public lands is regulated by EO and other regulations. EO 11644 specifies in Section 9 that if the agency determines that the use of OHVs will cause or is causing adverse effects on soil, wildlife, wildlife habitat, or cultural resources in certain areas or on certain trails, the agency will immediately close those areas and trails to OHV use until such time as the adverse impacts have been eliminated and measures have been implemented to prevent future recurrence.

- The FLPMA requires resources to be managed to best meet present and future needs of the American people. Several tribes tend to feel that current BLM public land management is placing undue emphasis on present needs with little thought being given to future needs or conditions. For example, the federal agencies need to consider how ecosystems will respond to the stresses of global climate change.

- The tribes favor ACEC protection of the relevant and important values found in many places on public lands, especially of cultural and water resources. They feel that all areas having these values should be designated or managed to protect those values.

Methods and Assumptions

To analyze the potential effects of the alternatives on archaeological and historical resources, information was gathered from inventories and excavations in and adjacent to the Planning Area. However, less than 1% of the RFO has been inventoried, and only a handful of excavations have been conducted. The analysis is also based on professional expertise of BLM specialists at the RFO, a review of the relevant scientific literature, and consultation with tribal governments and individual tribal members.

Effects are quantified where possible. In absence of quantitative data, best professional judgment was used. Impacts are sometimes described using ranges of potential impacts or in qualitative terms, if appropriate. The intensities of impacts are also described, where possible.

This analysis was based on the following assumptions:

- All laws for the management and protection of cultural resources would be followed, to the extent allowed by budget and available personnel.
- Section 106 inventories and mitigation would be conducted for all proposed projects, as required by NHPA, under each alternative.

- Cultural resources would continue to be discovered throughout the RFO.
- Some proactive Section 110 inventory, research, stabilization, or preservation would be accomplished in the Planning Area each year.
- NRHP-listed and some NRHP-eligible sites, as well as the cultural resources in the ACECs, would be monitored for vandalism and protected or stabilized, as necessary.
- All surface-disturbing activities include mitigation to reduce impacts to cultural resources. Analysis of impacts includes all mitigation.
- The demand for use of cultural resources, public use, scientific use, and traditional use would remain at current levels or increase slightly.
- As access to an area increases, incidental damage of cultural resources adjacent to the access route(s) would increase. Impacts from incidental damage would be reduced as distance from the access route increases.

Environmental Consequences

Impacts to cultural resources could result from actions proposed under the following resource management programs:

- Vegetation and Fire and Fuels Management
- Cultural Resources
- Visual Resources
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on cultural resources.

Alternative N: No Action

Impacts from Vegetation and Fire and Fuels Management

Restoration activities under this alternative would continue to be implemented using a variety of treatment methods; impacts to cultural resources would vary by treatment method. Eradication of noxious weeds may involve surface disturbance, which also could impact cultural sites. Sites eligible for listing on the NRHP in these areas would continue to be avoided by any surface-disturbing activity. Mitigation of some impacts would be provided by following Section 106 procedures.

Wildland fire itself does not affect cultural resources in the same manner as surface-disturbing activities do. Impacts from fire vary based on the type of material that composes the cultural resources as well as the temperature and duration of exposure to fire. As a general rule, fire does not affect buried cultural materials. Studies show that even a few inches of soil cover (4 inches) are sufficient to protect cultural materials (Oster no date). Fires that burn hot and fast through a site may have less effect on certain types of cultural materials than do fires that smolder in the duff or burn for a long period of time, allowing heat from the fire to penetrate the surface. Determining temporal context is an important part of archaeology. Fire has the potential to adversely impact the dating potential of archaeological data obtained from both

organic and inorganic material (Deal no date, Buenger 2003, Lloyd et al. 2002, Shackley et al. 2002, Solomon 2002). The high heat from fire can and often does destroy the usefulness of datable deposits.

Prehistoric and historic resources potentially affected by fire may be inorganic (lithic, ceramics, cans, glass, rock art) or organic (basketry, wooden structures, dendroglyphs). Generally speaking, organic materials are more at risk because they tend to burn or alter at lower temperatures than do inorganic items. Fire impacts to inorganic cultural resources include fracturing, shattering, and changes in color and internal luster, all of which might reduce an artifact's ability to render information about the past. As a general rule, hotter temperatures and longer exposure to fire are more likely to affect lithic materials. When these materials are likely to be present, it may be necessary to take protective measures. Historic earthworks such as trails, roads, irrigation ditches, and canals are less sensitive to fire. Wildland fire could also impact rock art. Fire effects include soot smudging and discoloration from smoke, which obscure the rock art images; degradation of the rock surface from spalling, exfoliation, and increased weathering; changes in organic paints because of heat; and damage to rock varnish, which could destroy the varnish's potential to date the art (Tratebas 2004, Kelly and McCarthy 2001).

Emergency suppression activities often are underway before any resource-protection efforts are organized. Therefore, cultural resources may be inadvertently damaged. Fire-suppression activities may require use of heavy equipment that can directly impact cultural resources through surface disturbance. Wildland fires may destroy or alter cultural sites susceptible to damage from fire, heat, or smoke. Fire suppression activities overall would help to stop wildland fire and ultimately protect cultural resources that might be destroyed or damaged by fire. Therefore, impacts from fire and fuels management would be minor to moderate, considerably less in intensity than wildfires that would destroy wooden features and structures and damage rock art and surface features.

Emergency stabilization and rehabilitation (ESR) of burned areas would be subject to intensive cultural-resource inventories and Section 106 review. Significant cultural sites would be protected by these measures. The only unmitigated impacts would be to sites that do not meet the NRHP eligibility criteria.

Prescribed fires would be allowed across sites not vulnerable to destruction by fire, such as areas that have burned in the past. Areas excluded from fire treatment would be rock art, wooden structures or features, and any area vulnerable to the indirect effects of subsequent erosion.

Mechanical treatments require the use of heavy equipment. As described previously, use of heavy equipment can directly impact cultural resources through surface disturbance and direct destruction of artifacts and features. Biological treatments would have no direct impacts on cultural resources because the biological agent targets the vegetation species treated. Manual treatments would have minimal effects on cultural resources because all treatment is done by hand, with no use of heavy equipment.

Riparian invasive and exotic species removal could occur in some riparian areas and may directly impact archaeological and historical resources. However, treatment efforts would help to stop the root damage and erosion of deposits and structures caused by invasive species and would help to keep archaeological and historical resources intact. Mitigation associated with compliance with NEPA and NHPA would help to redesign projects so that sites would be avoided or measures would be taken to protect these resources.

Vegetation treatments would have indirect impacts on cultural resources because of increased erosion and displacement and destruction of surface artifacts and, in some cases, destruction of surface and buried structures and features. Overall impacts from vegetation management would result in direct and indirect impacts to cultural resources. These impacts could be partially mitigated during compliance with NEPA and Section 106 of NHPA. Projects would be redesigned to avoid historic properties or those eligible for or listed on the NRHP, thus mitigating some of the direct and indirect impacts.

These impacts to cultural resources would also apply to resources of importance to Native Americans. Also, restoration, including fire and fuels management, could increase some native vegetation important to Native Americans. Historically (prior to the arrival of Euro-Americans), Native Americans burned areas in the RFO to encourage growth of native plants, as well as for other reasons. Restoration efforts benefit some types of native vegetation and provide additional locations for Native Americans to collect such vegetation. Impacts from all vegetation treatments, including fire and fuels management, on resources of importance to Native Americans would be moderate. Traditional uses of and access to resources would continue and would be sustainable.

Impacts from Cultural Resources

Under Alternative N, present management would continue and there would be no site use allocation and no priority areas for new field inventories. Cultural resources would be managed in compliance with laws and regulations, and this management usually would be addressed only if and when a given site was threatened by a surface-disturbing activity. Cultural inventories, documentation, research, protective measures, and monitoring would continue to provide information about the past in the RFO and to protect cultural resource sites.

Impacts from Visual Resources

VRM Classes I and II would help protect cultural resource sites and landscapes from visual intrusions and surface disturbance; however, such categories could also limit research excavations. Under Alternative N, none of the lands managed by the RFO are classified as VRM Class I; 529,500 acres (25%) would be managed as VRM Class II. Major modifications to the visual landscape could be allowed on 1,029,500 acres (48% of the RFO) managed as VRM Class IV. These impacts may also apply to TCPs and the landscapes associated with them, although any impacts would be subject to Section 106 compliance.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for cultural resources.

Impacts from Forestry and Woodland Products

Alternative N allows for harvesting of forest and woodland products across most of the RFO (all areas, outside of WSAs, on a case-by-case basis). Forest and woodland harvest could have potential inadvertent impacts to cultural resources from the cross-country driving and surface disturbance associated with woodcutting and timber harvest activities. Commercial timber harvesting would be allowed only on a case-by-case basis west of Capitol Reef National Park, subject to compliance with NEPA and Section 106 of NHPA. Projects would be redesigned to avoid historic properties or those eligible for or listed on the NRHP, thus mitigating some of the direct and indirect impacts. It is important to note that not all areas open to woodland-products use contain actual woodlands that would be targeted for use. As such, the actual acres on which this activity would occur is expected to be much less than the total amount of lands open for this use, which could result in localized areas in which impacts to cultural resources would occur but minor impacts overall. Woodland harvest would also result in long-term benefits to traditional cultural practices of Native Americans in the RFO.

Impacts from Livestock Grazing

Under this alternative, 138,952 acres would continue to be unavailable to livestock grazing; 1,989,048 acres would continue to be available to grazing. The dispersed nature of livestock grazing can cause disturbance by livestock that is spread lightly over large areas, in most cases. In areas in which livestock congregate and trail, cultural resource sites could be impacted by short-term removal of protective vegetation cover, increased soil compaction, and some mixing of artifacts and contextual relationships. These types of impacts would be site-specific and localized. Adherence to *Fundamentals of Rangeland*

Health and *Standards and Guidelines for Grazing Administration* would result in mitigation of these possible impacts and a decrease in potential erosion and trampling. Impacts on specific areas would be identified and mitigated through the grazing-permit administration process. With mitigation, these impacts would likely be relatively minimal. Changes to grazing management could be subject to adherence of Section 106 of NHPA, which would mitigate impacts to cultural resources and resources of importance to Native Americans.

Impacts from Recreation

Visitor use is expected to increase throughout the RFO. Under this alternative, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified. OHV use in particular could lead to inadvertent damage to cultural sites, as well as collection of artifacts and vandalism of sites because of ease of access across a large portion of the RFO.

Development of recreation facilities would increase the potential for the identification of cultural resources during inventories before development. In addition, providing developed sites in a few areas of high recreation use would reduce the potential for unmitigated impacts from dispersed recreation. However, there would be a potential for significant cultural resource impacts at non-developed recreation sites. Although use would be dispersed over a larger area, reducing the magnitude of impact, non-developed recreation sites usually do not have cultural resource inventories and clearances before being established.

Impacts from non-developed recreation would be mitigated on a case-by-case basis when discovered. Cultural sites adjacent to developed recreation sites could be impacted because of inadvertent damage from uninformed or unaware recreationists. The use of signs, trails, and facilities would reduce inadvertent damage to cultural resources. Limited management at popular dispersed use areas would continue to result in concentrated recreation use, which could increase the potential for inadvertent damage of cultural sites.

More public land users and more intense recreational use on public lands near the communities would result in direct and indirect impacts to cultural resources. Impacts in some specific areas near communities or on some types of archaeological sites, such as caves, rock shelters, or rock art, could be moderate or major. Visitors conducting activities under special recreation permits would be educated about the provisions of the Archaeological Resources Protection Act (ARPA) and Native American Graves Protection and Repatriation Act (NAGPRA), which would help protect cultural resource sites.

These same impacts would also apply to resources of importance to Native Americans, with the exception that additional recreational use could interfere with traditional uses in some areas.

Impacts from Travel Management

Impacts to cultural resources primarily stem from management actions that restrict or increase access. Increased access to cultural sites could increase contact by visitors who could intentionally damage sites by collecting surface artifacts, vandalizing, illegally digging, or otherwise excavating the sites. Visitors could also unintentionally damage sites by camping or driving across them. Reducing such access by closing roads or restricting travel could thus protect cultural resources. However, increased access could allow for the increased presence of law enforcement, cultural resource personnel, and site stewards for purposes of monitoring sites and areas. Increasing access could also increase the amount of cultural resource inventories and research, by decreasing the cost of excavation, inventory, or recording. Finally, increased access would allow for the increased presence of the public, which could also deter vandalism. This possibility is suggested by recent ARPA cases in southern Utah, showing that pothunters in the area

tend to select isolated sites to excavate without getting caught. As a result, more and more pothunters in the area are using OHVs or 4-wheel drive vehicles to access and vandalize sites in roadless areas.

Under Alternative N, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing unlimited access to the majority of the RFO. Allowing cross-country OHV use could generally impact surface features, break artifacts, and otherwise disturb cultural resources at the surface. It could also result in the pioneering of new routes, increasing motorized access throughout these acres and increasing incidental damage to cultural sites. Unlike other permitted uses, cultural resource inventories and mitigation strategies would not be implemented before designating these large areas open to cross-country OHV use. Mitigation of cultural resource impacts would be implemented on a case-by-case basis after the impact has occurred. Mitigation would occur only in situations in which impacted properties retain qualities that make them eligible for inclusion in the NRHP.

Alternative N would limit motorized vehicles to existing, designated, and maintained routes on 277,600 acres (13% of the RFO); 214,000 acres (10% of the RFO) would be closed to motorized vehicle use, thereby limiting direct and indirect impacts associated with vehicle use on or near sites. The public would have access to 4,315 miles of unpaved routes in the RFO, which could allow continued access for vandalism of cultural resources.

Among the alternatives, Alternative N would have the greatest adverse impacts to cultural resources because of the large amount of lands open to cross-country motorized use.

Impacts from Lands and Realty

Land disposals would impact cultural resources because the disposed lands and associated resources would lose the protection provided by federal laws. Impacts would be direct and long term, depending on the location of the lands to be disposed and the nature of the cultural resources on them. Retaining significant cultural sites in federal ownership and acquiring non-federal lands with significant cultural sites would provide protection to these sites.

Any new land use authorizations (e.g., ROWs, permits, leases, easements) would cause direct and indirect long-term impacts to cultural resources and would be mitigated under NEPA and Section 106 of NHPA. Under this alternative, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas (with exceptions granted only when the proposed authorization would not create substantial surface disturbance or would create only temporary impacts). Thus, impacts to cultural resources in these avoidance areas would be negligible.

Impacts from Minerals and Energy

Cultural resource values on 1,236,500 acres (58% of the RFO) open to leasing subject to the standard terms and conditions and on 409,200 acres (19% of the RFO) open to leasing subject to moderate constraints (TL, CSU) could be impacted by oil and gas leasing. Cultural site densities throughout the RFO, although varying in different areas, are low enough to provide for the identification and avoidance of cultural sites when lessees exercise initial development rights associated with oil and gas leases. Based on the Reasonably Foreseeable Development (RFD), oil and gas developments within these areas could impact 8,180 acres during the next 15 years (Appendix 12). Oil and gas development on these acres would include surface disturbance on an average of between 2 and 4 acres per drill pad (depending on RFD Area) and between 2 and 5 miles of road per drill pad (depending on RFD Area), with an average of 4 acres of surface disturbance per mile of road (Appendix 12). All developments on these acres would typically be subject to Class III cultural resource inventories and evaluation on a project-by-project basis prior to allowing the disturbance, whether road construction or well pad development. This requirement would likely result in the identification of cultural sites in these areas. Site densities throughout the RFO

would generally result in the identification and avoidance of cultural sites during construction activities associated with development. However, surface disturbance associated with oil and gas development in areas of very high cultural-site density could result in the identification of sites that are unavoidable to mineral development. Sites that are unavoidable would be mitigated, resulting in the physical alteration or elimination of sites as they are mitigated through data recovery or other onsite means.

Managing 1,668,300 acres (78% of the RFO) as open to some category of oil and gas leasing could result in surface disturbance caused by seismic operations that support exploration on oil and gas leases. Potential oil and gas leasing categories include the following: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (TL, CSU), and open to leasing subject to major constraints (NSO) This would likely result in the identification of cultural sites in these areas. Upon identification, seismic operations should be able to avoid all the identified sites.

Alternative N allows sale of mineral materials (salable minerals) on 1,668,300 acres (78% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted—any cultural resources present have likely been significantly altered or destroyed, resulting in loss of information. However, new sites would be subject to Section 106 procedures, which would either protect the site through avoidance or would result in mitigation (scientific data-recovery methods such as recordation, surface collection, subsurface testing, and excavation).

Under Alternative N, 459,700 acres would be closed to leasing and closed to disposal of salable minerals; 169,480 acres would continue to be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to cultural resources.

Impacts from Special Designations

Wilderness Study Areas

WSAs are managed under the IMP criteria until Congress either designates an area as wilderness or releases it from further consideration. This management effectively provides protection to the cultural resources in those areas by limiting motorized access and nearly all activities that could adversely affect archaeological and historic sites. However, this management also affects research proposals and activities at sites within WSAs. Anything that would not comply with the IMP (e.g., anything that would impair the suitability of such areas for preservation as wilderness) would not be authorized.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect cultural resources by preventing ground-disturbing activities in the river corridors. All eligible segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative N. This management would benefit cultural resources by limiting ground disturbance in these areas.

The Dirty Devil, No Mans Mesa, Robbers Roost Canyon, Fish Creek and Quitchupah Creek segments have cultural as outstandingly remarkable values. However, these segments will not be designated as suitable for further consideration in the NWSRS. The cultural resource outstandingly remarkable values for these river segments will continue to be protected under other resource management decisions. WSR management decisions will not impact cultural resources on these river segments.

The Maidenwater Creek, Fremont Gorge, Sams Mesa, Twin Corral Box Canyon, Larry Canyon and Beaver Wash segments do not contain cultural resources as part o the outstandingly remarkable values. Management decisions that would continue to protect their outstandingly remarkable values may also

benefit cultural resources. Since these river segments would not be designated as suitable, there are no WSR management decisions that would impact cultural resources.

Areas of Critical Environmental Concern

Although ACEC designation alone does not necessarily provide protection, management actions included in ACECs are often more restrictive, thus indirectly providing protection for cultural resources. Protections associated with ACEC designation that would affect cultural resources include managing oil and gas leasing as closed to leasing or open to leasing subject to moderate constraints (NSO); managing more areas under restrictive VRM designations; restricting livestock grazing; and limiting travel. Alternative N continues the designation of four ACECs (14,780 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface disturbing activities within those areas, protecting cultural resources. Such restrictions could include closing to OHV use; managing as either closed to leasing or open to leasing subject to moderate constraints (NSO), depending on the ACEC; managing as unavailable for livestock grazing in three of the four ACECs; and acquiring inholdings.

Alternative A

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N However, under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually for all treatments). Although no maximum treatment acreage limits would be set under Alternative N, it is likely that more acres would actually be treated under that alternative because the 2005 Land Use Plan Amendment for Fire and Fuels Management allows for the full range of fire and fuels management actions to achieve ecosystem sustainability. Alternative N allows for treatment of vegetation (including mechanical, wildland fire use and/or prescribed fire, and chemical methods). Alternative A incorporates more mechanical treatment than do Alternative N or the Proposed RMP. Mechanical treatments require the use of heavy equipment. As described previously, use of heavy equipment can directly impact cultural resources by causing surface disturbance and direct destruction of artifacts and features.

Impacts from Cultural Resources

Allocating and managing cultural resource sites to one of six uses would result in the sites being proactively managed compared to Alternative N and considering cultural resource sites' varied values. These six uses are as follows: scientific, conservation, traditional, public, experimental, or discharged from management. Under Alternative A, most cultural sites would be managed for public use, thereby providing opportunities to educate the public about past human activities within the RFO. This type of site management would require extensive inventories and other research so that the sites could be interpreted for the public. However, designated public use sites could also lead to damage and vandalism at or near the sites.

Monitoring of identified cultural sites with known impacts, as well as of sites that are sensitive to incidental impacts, would indicate whether management actions would be needed to protect the sites, thus decreasing the potential for losing cultural values because of deterioration and impact. The prioritization for new non-Section 106 inventories in the Horseshoe Canyon South area would result in the identification of cultural resources and sites, which in turn would increase the knowledge base on the Archaic period occupation of Utah and would provide for improved management of these resources.

Impacts to cultural landscapes eligible for the NRHP would be considered through adherence to federal regulations. This management could protect the cultural characteristics of the landscapes. However, activities could be permitted that could result in the degradation or loss of landscape characteristics.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM would be similar to those described under Alternative N. Under Alternative A, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 0 acres would be designated as VRM Class II; 392,800 acres (18%) would be designated as VRM Class III; and 1,288,300 acres (61%) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying surface disturbance and potential inadvertent damage to cultural resources. These areas would still be subject to Section 106 procedures prior to the surface-disturbing activity, thereby increasing discovery of sites and providing protection (through site avoidance) or increased knowledge (through data recovery).

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative A, resulting in no additional protection for cultural resources.

Impacts from Forestry and Woodland Products

Impacts from harvesting of forest and woodland products would be the same as those described for Alternative N. However, Alternative A allows for harvesting of forest and woodland products across more of the RFO (all areas, outside of WSAs, when sustainable and compatible with restoring, maintaining, or improving forest health). Thus, forest and woodland products harvest would be subject to compliance with NEPA and Section 106 of NHPA. Projects would be redesigned to avoid historic properties or those eligible for or listed on the NRHP, thus mitigating some of the direct and indirect impacts. It is important to note that not all areas open to woodland products use contain actual woodlands that would be targeted for use. As such, the actual acres on which this activity would occur is expected to be much less than the total amount of lands open for this use. The result could be localized areas in which impacts to cultural resources would occur but minor impacts overall. Woodland harvest would also result in long-term benefits to traditional cultural practices of Native Americans in the RFO.

Impacts from Livestock Grazing

Impacts caused by livestock grazing would be the same as those described for Alternative N. However, under Alternative A, an additional 36,950 acres would be available for grazing. Thus, impacts to cultural resources could occur over a slightly larger area under Alternative A.

Impacts from Recreation

The establishment of and management associated with SRMAs would provide for management at popular recreation use areas. Management of these areas would decrease the potential for inadvertent damage of cultural sites, compared to Alternative N.

Under Alternative A, five SRMAs (514,500 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. This management would decrease the potential for inadvertent damage of cultural sites as compared to Alternative N. Limiting OHV use in the Otter Creek Reservoir SRMA to designated routes would limit the extent of potential impacts to cultural resources.

The construction of recreation facilities in the Big Rock SRMA and the Sahara Sands SRMA would focus recreation use, minimizing long-term impacts. This focus would also decrease the potential for inadvertent damage of cultural sites as compared to Alternative N. Managing the Dirty Devil/Robbers Roost SRMA (290,000 acres) for primitive and semi-primitive recreation would reduce the potential for damage to cultural resources, by limiting OHV recreation use to designated routes. Managing the Factory Butte SRMA (199,700 acres) for a motorized recreational opportunity and allowing moderate-to-

extensive landscape modification would have potentially major impacts and would result in continued impacts to cultural resources. However, this area is receiving heavy motorized use currently, so sites are likely already damaged.

Alternative A would allow vehicles to pull off of designated routes (outside WSAs) 100 feet to either side of centerline (for parking or staging) and 300 feet to either side of centerline (for camping). This could result in vehicles generally impacting surface features, breaking artifacts, and otherwise disturbing cultural resources at the surface.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative A designates substantially fewer areas (449,000 acres, or 21% of the RFO) as open to motorized vehicles. Motor vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; 0 acres would be closed to motorized vehicle use. The amount of open areas, although greatly reduced, compared to Alternative N, would still result in impacts to cultural resources from vehicle use in those areas. However, the potential for new impacts to cultural resources is low because these areas have been subject to disturbance from cross-country use during recent years. Continued use of OHVs would not be expected to cause additional adverse impacts.

The remainder of the RFO would limit motorized use to designated routes—the public would have access to 4,312 miles of unpaved routes (slightly more than under Alternative N), resulting in the potential for inadvertent damage to cultural resources along those routes. There would be 68 miles of routes closed, resulting in less potential for damage to cultural resources in those areas. No areas would be closed to motorized use, with no accompanying benefits to cultural resources.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that fewer acres would be recommended for withdrawal (154,700 acres under Alternative A). Thus, unavoidable impacts to cultural resources from minerals activities would be greater under Alternative A than under Alternative N, although sites that are unavoidable would be mitigated.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that under Alternative A there are fewer ROW avoidance areas because Section 106 of NHPA would need to be adhered to for all actions undertaken by BLM, impacts to cultural resources would be negligible.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. Managing 1,681,100 acres (79% of the RFO) as open to various categories of oil and gas leasing could result in surface disturbance from seismic operations that support oil and gas leases. Oil and gas leasing categories include the following: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (TL, CSU), and open to oil and gas leasing subject to major constraints (NSO). This management would likely result in the identification of cultural sites in these areas. Upon identification, seismic operations should be able to avoid all the identified sites.

Alternative A allows sale of mineral materials (salable minerals) on 1,681,100 acres (79% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted—any cultural

resources present have likely been significantly altered or destroyed, resulting in loss of information. New sites would be subject to Section 106 procedures, which would either protect the site through avoidance or result in mitigation (scientific data recovery methods such as recordation, surface collection, subsurface testing, and excavation).

Under Alternative A, 446,900 acres would be closed to leasing and closed to disposal of salable minerals; 154,700 acres would continue to be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to cultural resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible river segments would be recommended as suitable, and no special management to protect the outstandingly remarkable values of these rivers would be provided. Thus, the potential for inadvertent damage to cultural resources from surface-disturbing activities would be greatest under this alternative. However, most of the eligible river segments (98 of the 135 miles total) are also within WSAs, which would provide protection for cultural resources by limiting surface disturbance in those areas.

Areas of Critical Environmental Concern

Under Alternative A, no areas would be designated as ACECs. Providing no special management prescriptions would allow surface-disturbing activities within those areas that could result in inadvertent damage to cultural resources

Proposed RMP

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative A.

Impacts from Cultural Resources

Impacts would be less than those described for Alternative A. Fewer sites would be allocated to public use under the Proposed RMP, and more sites would be managed for their information potential and scientific use and would be made available for scientific study. This scientific use category would be applied almost exclusively to prehistoric archaeological sites; most historic sites with ranching/homestead structures would remain in the public use category. The amount of new field inventory necessary under the Proposed RMP would be far lower than under Alternative A because many more site types would be managed for scientific use under the Proposed RMP. The majority of sites would be preserved for scientific study, which would decrease public access to cultural sites and decrease the likelihood of inadvertent damage or vandalism to these resources. In addition, the prioritization for new field inventories in the Horseshoe Canyon, Trough Hollow, Bull Creek, and other areas of special cultural significance would increase the cultural knowledge base in these areas, while providing for improved management of these resources.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under the Proposed RMP, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 249,800 acres (12%) would be designated as VRM Class II; 393,100 acres (18%) would be designated as VRM Class III; and 1,038,200 acres (49%) would be designated as VRM

Class IV. The majority of the RFO would be designated as VRM Class III or IV, which could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying surface disturbance and potential inadvertent damage to cultural resources. However, less of the RFO would be designated in these VRM classes than in Alternative N or A, resulting in less potential impacts to cultural resources, compared to those alternatives.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres would be managed to maintain wilderness characteristics. Management actions would include minimizing or avoiding surface-disturbing activities. Such actions would include designating the areas as open to leasing subject to major constraints (NSO), limiting motorized uses to designated routes, and designating the areas as VRM Class II. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to cultural resources because there would be limited or no vehicular activity or other forms of disturbance that could affect cultural sites. Protection of wilderness characteristics lands can restrict methods of archaeological site excavations or research activities during which surface-disturbing activities would occur. However, resource inventories would not be precluded, and information gathered from these inventories would increase knowledge of cultural resources.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forestry and woodland products management would be similar to Alternative A. However, more lands would be closed to this type of use under the Proposed RMP (one WSR segment—5 miles, compared to zero segments under Alternative N), resulting in less potential impacts to cultural resources.

Traditional cultural practices would not be affected because Native American collection of woodland products in riparian areas (outside of WSAs) for traditional purposes would be allowed.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A. However, the Proposed RMP would establish five SRMAs (860,390 acres) to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. The Proposed RMP proposes only 24,400 acres at Factory Butte and 90 acres at Big Rocks as OHV SRMAs, thus decreasing the potential for inadvertent damage of cultural sites, compared to Alternative A.

The Proposed RMP would allow vehicles to pull off of designated routes (outside WSAs) 50 feet to either side of centerline (for parking/staging) and 150 feet to either side of centerline (for camping). Although this could result in vehicles generally impacting surface features, breaking artifacts, and otherwise disturbing cultural resources at the surface, the area of potential impact would be less than under either Alternative N or A.

Impacts from Travel Management

The impacts experienced as a result of travel management would be less than those described under Alternative N. However, the Proposed RMP would designate only 9,890 acres (less than 1% of the RFO) as open to motorized vehicles; would limit motor vehicles to designated routes on 1,908,210 acres (90% of the RFO); and would close 209,900 acres (10% of the RFO) to motorized vehicle use. OHV use in open areas, although greatly reduced, compared to Alternative N, would still result in impacts to cultural

resources from vehicle use in those areas. The remainder of the RFO would limit motorized use to designated routes. The public would have access to 4,277 miles of unpaved routes; 345 miles of routes would be closed, resulting in less potential for damage to cultural resources in those areas.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that more acres (176,200 acres) would be recommended for withdrawal under the Proposed RMP. Thus, unavoidable impacts to cultural resources from minerals activities would be less under the Proposed RMP than under Alternative N.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that fewer ROW avoidance areas are proposed under the Proposed RMP. Because Section 106 of NHPA would need to be adhered to for all actions undertaken by BLM, impacts to cultural resources would be negligible.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy would be similar to those described under Alternative N. A similar acreage (1,680,700 acres, or 79% of the RFO) would be open to some category of oil and gas leasing, which could result in surface disturbance caused by seismic operations that support oil and gas leases. (The potential categories are as follows: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints [TL, CSU], and open to leasing subject to major constraints [NSO]). This would action would likely result in the identification of cultural sites in these areas. Upon identification, seismic operations should be able to avoid all the identified sites.

The Proposed RMP also allows the sale of mineral materials (salable minerals) on (1,680,700 acres, or 79% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted—any cultural resources present probably have been significantly altered or destroyed, resulting in loss of information. However, new sites would be subject to Section 106 procedures, which would either protect the site through avoidance or result in mitigation (scientific data recovery methods such as recordation, surface collection, subsurface testing, and excavation).

Under this alternative, 447,300 acres would be closed to leasing and 601,800 acres would be closed to disposal of salable minerals; 176,200 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to cultural resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect cultural resources by preventing ground-disturbing activities in the river corridors. Under the Proposed RMP, one suitable segment, The Fremont Gorge (5 miles), would be managed to protect its outstandingly remarkable values, free-flowing nature, and tentative classification. This management would protect cultural resources from inadvertent damage, by limiting ground-disturbance in this area. The Proposed RMP would recommend one more suitable river segment than would Alternative A but would recommend fewer segments than

under Alternative C or D. Of the remaining segments, not being carried forward in the Proposed RMP, 98 miles are within WSAs, leaving 32 miles on which ground-disturbing activities could inadvertently impact cultural resources. The Proposed RMP would provide less protection to cultural resources through WSR decisions than would Alternative N, C, or D but more than would Alternative A.

Areas of Critical Environmental Concern

The Proposed RMP designates two ACECs (2,530 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within those areas, thereby providing protection to cultural resources from inadvertent damage. Disallowed uses would include the following: closing the area to OHV use; managing the area as open to leasing subject to major constraints [NSO], depending on the ACEC; making the area unavailable for livestock grazing; and acquiring inholdings.

Alternative C

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A. However, under Alternative C, fewer acres would be treated annually (averaging 26,000 annually for all treatments). In addition, this alternative proposes using only methods that mimic natural processes (fire and biological treatment methods) to manage vegetation. Such treatments could be less effective than conventional vegetation treatments and would not be effective in all vegetation communities. The treatments could result in the loss of existing vegetation cover, indirectly increasing erosion. Thus, impacts to soils under Alternative C would likely result in reduced short-term impacts (altered vegetation structure and increased local erosion and sedimentation rates) compared to the Proposed RMP, as well as reduced long-term impacts (improved vegetative cover and increased plant diversity, thereby stabilizing soil, improving overall watershed function and condition, and allowing greater infiltration and soil moisture storage).

Impacts from Cultural Resources

Impacts would be similar to those described for the Proposed RMP. However, under Alternative C, most site types would be allocated to conservation use, resulting in a decrease in opportunities for research and a decrease in the level of management involvement. Allocating most site types to conservation use would preserve the sites in the long term, making them available for future use. In addition, the prioritization for new field inventories in the Horseshoe Canyon, Trough Hollow, Bull Creek, and other areas of special cultural significance would increase the cultural knowledge base in these areas and would provide for improved management of these resources. Advertising archaeological sites and resources could increase visitation, which may result in trampling, creation of trails and removal of vegetation which would increase erosion and damage to sites. The increase in visitation could require additional monitoring of archaeological resources to identify and address impacts. Increased visitation could also denigrate the values Native Americans have for the area.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative C, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 230,600 acres (11%) would be designated as VRM Class II; 509,100 acres (24%) would be designated as VRM Class III; and 941,400 acres (44%) would be managed as VRM Class IV. Although the majority of the RFO would be designated as VRM Class III or IV, less of the RFO would be designated in VRM Class IV (which allows major modifications to the existing character of the landscape) than in Alternative N or A or the Proposed RMP, resulting in less potential for inadvertent damage to cultural resources.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for cultural resources.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forestry and woodlands management would be similar to the Proposed RMP, although more lands (12 WSR segments—135 miles) would be closed to this type of use under Alternative C. Thus, the potential for localized surface disturbance to cultural resources would be less under Alternative C than under the Proposed RMP.

Traditional cultural practices would not be affected because Native American collection of woodland products in riparian areas (outside of WSAs) for traditional purposes would be allowed.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described for Alternative A, except that four SRMAs (930,000 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. No SRMAs would be established for OHV use under Alternative C, thereby decreasing the potential for the damage that this type of use could cause to cultural resources.

Managing the Dirty Devil/Robbers Roost SRMA (375,800 acres) for dispersed recreation in a primitive setting would indirectly reduce the potential for recreation to cause surface disturbance (and associated damage to cultural resources). Managing the Henry Mountains SRMA (533,900 acres) for primitive and semi-primitive recreation and managing the Sevier Canyon SRMA (7,500 acres) for scenic values would indirectly maintain or reduce the potential for disturbance and damage to cultural resources. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities could have localized, site-specific impacts, although Section 106 procedures would be adhered to prior to construction of any facilities.

Alternative C allows vehicles to pull off of designated routes (outside WSAs) 25 feet to either side of centerline (for parking/staging); camping would be allowed only in designated campsites, with travel between campsites allowed only on designated routes. Together, these restrictions would minimize disturbance to cultural resources and would result in less disturbance to these resources than would Alternative N or A or the Proposed RMP.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under the Proposed RMP. However, Alternative C designates no areas as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,445,000 acres (68%) of the RFO; and 683,000 acres (32%) would be closed to motorized vehicle use. The lack of open areas would eliminate impacts (breaking artifacts and disturbing/damaging surface features) that vehicle use in those areas could cause to cultural resources. Limiting motorized use to designated routes—the public would have access to 3,192 miles of unpaved routes—would generally limit cultural resource impacts to areas in the immediate vicinity of the designated route; 1,188 miles of routes would be closed, resulting in less potential for damage to cultural resources in those areas.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that more acres (331,100 acres) would be recommended for withdrawal under Alternative C. Thus, unavoidable impacts that minerals activities would cause to cultural resources would be less under Alternative C than under Alternative N.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N. However, more ROW avoidance areas are proposed under Alternative C (735,000 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments, and 16 ACECs). Because Section 106 of NHPA would need to be adhered to for all actions undertaken by BLM, impacts to cultural resources would be negligible.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy would be similar to those described under Alternative N because a similar number of acres (1,541,700 acres, or 72% of the RFO) would be open to oil and gas leasing (open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints [TL, CSU], and open to oil and gas leasing subject to major constraints [NSO]). Such leasing could result in surface disturbance caused by seismic operations that supporting oil and gas leases, likely resulting in the identification of cultural sites in these areas. Upon identification, seismic operations should be able to avoid all the identified sites.

Alternative C allows sale of mineral materials (salable minerals) on 1,541,700 acres (72% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted—any cultural resources present probably have been significantly altered or destroyed, resulting in loss of information. However, new sites would be subject to Section 106 procedures, which would either protect the site through avoidance or result in mitigation (scientific data recovery methods such as recordation, surface collection, subsurface testing, and excavation).

Under this alternative, 586,300 acres would be closed to leasing and closed to disposal of salable minerals; 331,100 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts to cultural resources from these types of activities. Alternative C proposes more acres of mineral withdrawals and more areas closed leasing or to disposal of salable minerals than does Alternative N or A or the Proposed RMP. Therefore, Alternative C would preclude mineral and energy development in those areas and thus provide more protection to cultural resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect cultural resources by preventing ground-disturbing activities in the river corridors. Under Alternative C, all 12 suitable segments (135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. This management would protect cultural resources from inadvertent damage, by limiting ground disturbance in these areas.

Areas of Critical Environmental Concern

Alternative C designates 16 ACECs (886,810 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within the areas, thereby providing cultural resources protection from inadvertent damage. Disallowed uses would include closing to OHV use; managing as either closed to leasing or open to leasing with major constraints (NSO), depending on the ACEC; designating as VRM Class II; making the areas unavailable for livestock grazing; and acquiring inholdings.

Alternative D

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative C. Advertising archaeological resources could increase visitation, which may result in trampling, creation of trails and removal of vegetation which would increase erosion and damage to sites. There might be increased vandalism. May need to monitor and address result of increased visitation. This is why some offices have not designated archaeological ACECs. Increased visitation may also denigrate the values Native Americans have for the area.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. However, these impacts would occur over a much smaller area because of differences in VRM class designations between the two alternatives. Under Alternative D, 1,129,600 acres (53% of the lands managed by the RFO) would be designated as VRM Class I; 66,700 acres (3%) would be managed as VRM Class II; 355,100 (17%) would be managed as VRM Class III; and 576,600 (27%) would be managed as VRM Class IV. Just over half of the RFO would be designated as VRM Class I or II, meaning that the existing character of the landscape must be preserved or retained. Thus, surface-disturbing activities would generally not be allowed in these areas, resulting in reduced potential for damage to cultural resources, compared to Alternative N, A, or C or the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres would be managed to maintain wilderness characteristics. Management actions would include minimizing or avoiding surface-disturbing activities by designating the areas as closed to oil and gas leasing, closing the areas to OHV use, and designating the areas as VRM Class I. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to cultural resources because there would be no vehicular activity or other forms of disturbance that could affect cultural sites. However, protection of wilderness characteristics lands could also preclude archaeological site excavations or research activities during which surface-disturbing activities would occur. However, resource inventories would not be precluded, and information gathered from these inventories would increase knowledge of cultural resources, especially in the Wildcat Knolls and Mount Ellen—Blue Hills non-WSA areas. Management actions under Alternative D would also close off vehicle access to known cultural sites that are visited as a recreational activity within these non-WSA areas. Of all the alternatives, Alternative D would provide the most protection to cultural resources.

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative C. However, no commercial or non-commercial harvest of forest and woodland products would be allowed within the 682,600 acres of non-

WSA lands with wilderness characteristics. Thus, the potential for localized surface disturbance to cultural resources would be greatly reduced under Alternative D, compared to all the other alternatives.

Traditional cultural practices would not be affected because Native American collection of woodland products in riparian areas (outside of WSAs) for traditional purposes would be allowed.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative C. However, seven SRMAs (1,358,100 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. No SRMAs would be established for OHV use, which would decrease the potential for damage to cultural resources from this type of use. As described under Alternative C, the development of facilities could have localized, site-specific impacts, although Section 106 procedures would be adhered to prior to construction of any facilities.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. However, Alternative D would limit motorized use to designated routes on 972,800 acres (46% of the RFO); 1,155,200 acres (54%) would be closed to motorized vehicle use. The lack of open areas would eliminate impacts that vehicle use could cause to cultural resources in those areas. Limiting motorized use to designated routes—the public would have access to 3,043 miles of unpaved routes—would generally limit soils impacts to areas in the immediate vicinity of the designated route; 1,242 miles of routes would be closed, allowing protection of cultural resources in those areas.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that more acres (903,900 acres) would be recommended for withdrawal under Alternative D. Thus, unavoidable impacts that minerals activities would cause to cultural resources would be significantly less under Alternative D than under Alternative N.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance areas are proposed under Alternative D (1,203,800 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments, and 16 ACECs). Because Section 106 of NHPA would need to be adhered to for all actions undertaken by BLM, impacts to cultural resources would be negligible.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. However, these potential impacts would occur over a substantially smaller area under Alternative D; —967,500 acres, or 45% of the RFO— would be open to some category of oil and gas leasing that could result in surface disturbance caused by seismic operations that support oil and gas leases. Potential categories include the following: open to oil and gas leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (TL, CSU), and open to oil and gas leasing subject to major constraints (NSO). This management would likely result in the

identification of cultural sites in these areas. Upon identification, seismic operations should be able to avoid all the identified sites.

Alternative D allows sale of mineral materials (salable minerals) on 967,500 acres (45% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted—any cultural resources present probably have been significantly altered or destroyed, resulting in loss of information. However, new sites would be subject to Section 106 procedures, which would either protect the site through avoidance or result in mitigation (scientific data recovery methods such as recordation, surface collection, subsurface testing, and excavation).

Under Alternative D, 1,160,500 acres would be closed to leasing and closed to disposal of salable minerals; 903,900 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to cultural resources. Alternative D proposes more acres of mineral withdrawals and more areas closed to leasing or to disposal of salable minerals than do any of the other alternatives.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as described under Alternative C.

4.3.6 Paleontological Resources

This section presents potential impacts of the alternatives on paleontological resources. A comprehensive paleontological resource inventory of the RFO has not been conducted, and the occurrences of most paleontological resources are not known, although a review of paleontological research on formations contained within the RFO has identified the types of fossil resources known to be present. See Chapter 3 for a discussion of the paleontological resources in the RFO.

Impacts on paleontological resources occur from natural weathering and erosion, surface-disturbing activities, excavation, and theft or vandalism. In general, fossil resources are physically destroyed through such agents or activities; in the case of illegal theft and vandalism, important contextual data is also irretrievably lost. Unlike cultural resources, which exist largely at or near the land surface, paleontological resources are found both at the surface and throughout the subsurface environment. As a result, actions (e.g., coal mining or road construction), that may destroy a fossil presently at the surface may at the same time expose new resources that were deeply buried in rock strata. In this same manner, erosion is continually bringing new fossils to the surface even as it destroys what is presently exposed. For management purposes, impacts must be set against the context of the rarity of individual fossil specimens. As erosion brings a particular fossil specimen to the surface, if it is a relatively common and well understood fossil species or a non-diagnostic portion of a potentially rare form, impacts on that resource, up to and including its complete physical destruction, are not significant. By definition, all vertebrate fossils are considered rare by BLM, and impacts to these types of fossils are of greatest concern.

BLM paleontological resource management policy is to identify, evaluate, and (when appropriate) protect scientifically significant paleontological resources, ensuring that proposed land uses that BLM initiates or authorizes do not inadvertently damage or destroy these resources (BLM Manual 8270, *Paleontological Resource Management*). BLM policy also requires the facilitation of appropriate scientific, educational, and recreational uses of paleontological resources, such as research and interpretation. Surface-disturbing actions are required to mitigate damage to paleontological resources. Mitigation measures include project relocation or redesign (avoidance) or scientific data-recovery methods. Avoidance is BLM's preferred mitigation measure for surface-disturbing activities. Standard assessment/inventory and avoidance procedures conducted in conjunction with surface-disturbing actions would protect most paleontological resources from significant impacts. If mitigation measures are implemented, these newly exposed fossils become available for salvage, data recovery, scientific analysis, and preservation into perpetuity at a public museum (beneficial impact). The beneficial effects of mitigation include advances in scientific knowledge by both permitted field researchers and paleontologists who study fossils in museum collections, contributions to public education and interpretation, and community involvement and partnerships. In general, impacts on paleontological resources from ground disturbance are long-term in nature. Although natural erosion, exposure, and deterioration of paleontological localities may be slowed or halted, damage to fossils and localities cannot typically be reversed.

Methods and Assumptions

This analysis was based on the following assumptions:

- Paleontological resources will continue to be discovered throughout the RFO.
- Recovery and curation in paleontological resources by permitted specialists would result in resource protection and preservation of paleontological values as well as in educational opportunities.
- Paleontological resources identified during assessments and inventories would be protected through data collection and mitigation.

- The number of localities that could be impacted by various actions would directly correlate to the degree, nature, and quantity of surface-disturbing activities within the RFO.
- Surface-disturbing activities could expose, dislodge, or damage paleontological resources and features that were not visible prior to surface disturbance.

The analysis of potential impacts to paleontological resources is based on the expertise of BLM resource specialists at the RFO and the Utah State Office. The impact analysis is also based on review of existing literature, geologic maps, field trips, site visits, and information provided by non-planning team experts in BLM, United States Geological Survey (USGS), and other agencies.

Paleontological resources are associated with specific geologic formations. The paleontological resources section in Chapter 3 includes a summary table of the fossil assemblages that are associated with each geologic group, formation, and member in the RFO. No vertebrate fossil remains have been documented in the RFO. However, vertebrate fossil remains are found adjacent to the RFO (such as in Grand Staircase-Escalante National Monument), within many of the same geologic formations that are present in the RFO.

All surface-disturbing activities include mitigation to reduce impacts to paleontological resources. Analysis of impacts includes all mitigation measures in place. Effects are quantified when possible. In absence of quantitative data, best professional judgment was used.

Environmental Consequences

Impacts to paleontological resources would result from actions proposed under the following resource management programs:

- Vegetation and Fire and Fuels Management
- Paleontological Resources
- Visual Resources
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on paleontological resources.

Alternative N: No Action

Impacts from Vegetation and Fire and Fuels Management

Alternative N allows for limited treatment of vegetation (including mechanical, wildland or prescribed fire, and chemical methods). Wildland fire use and prescribed fire could cause direct and indirect impacts to paleontological resources. Fire could cause the direct destruction of organic fossil remains; the removal of vegetative cover by fire would accelerate erosion in the short-term, creating indirect impacts. However, these impacts would be negligible compared with similar impacts that occur by natural processes.

Fire suppression that involves the use of heavy equipment, road construction, and building of fire lines could damage or destroy surface fossils. In these areas, paleontological mitigation would reduce potential adverse impacts to below the level of significance. Potential long-term adverse impacts would result from the construction of new fire roads, which would increase access to BLM lands that were previously less

accessible to the public, thus increasing the potential for unauthorized fossil collecting and vandalism. The recovery and preservation of fossils as the result of paleontological mitigation would be a beneficial impact because these actions would permanently preserve paleontological resources that may otherwise never have been discovered, and make the resources available for scientific research, education, and display.

Impacts from Paleontological Resources

Monitoring scientifically significant paleontological localities would document the rate of deterioration and provide baseline data for possible site protection, restoration, or data retrieval. Not excavating and curating scientifically significant sites could result in the natural deterioration of the sites and the loss of the associated paleontological information. Not monitoring scientifically significant sites could result in the natural deterioration or incidental damage of the sites and the loss of the associated paleontological information.

Paleontological inventory data for the RFO is crucial for sound resource protection decisions. Annual compilations of all new paleontological localities should be updated into a single, comprehensive GIS database that is accessible to local resource specialists. This database would ultimately lead to better resource protection because it would provide decision-makers with emerging patterns for the spatial and temporal distribution of paleontological resources. Not requiring assessments or inventories in areas with a medium potential for paleontological resources could result in damage to fossils after surface disturbance commences, resulting in the loss of scientifically significant paleontological resources.

Providing interpretive opportunities could provide more paleontological resource sites for public use and education because inventories would be required to recover scientifically important data prior to allowing public use of the sites. Increased paleontological interpretation could also increase public appreciation for the decision area's paleontological values. Increased public appreciation could lead to increased user stewardship. Impacts associated with stewardship attitudes include the following: increased protection of paleontological sites, decreased inadvertent damage to or disturbance of paleontological sites, decreased vandalism and looting, and preserved integrity of paleontological resources.

Allowing surface collection of common invertebrate and botanical paleontological resources throughout the RFO could result in the incidental collection of scientifically significant resources.

Impacts from Visual Resources

In general, VRM class management actions would limit or allow surface-disturbing activities in certain areas, thereby affecting paleontological resources. VRM Classes I and II would be aimed at greater retention of existing landscape character than would Classes III or IV. Under Alternative N, none of the lands managed by the RFO would be classified as VRM Class I; 529,500 acres (25%) would be managed as VRM Class II; 569,000 acres (27%) would be managed as VRM Class III; and 1,029,500 acres (48%) would be managed as VRM Class IV. Restrictions on visually obtrusive developments in VRM Class II areas would limit development; although not a restriction on surface disturbance, management to preserve and maintain the landscape could reduce disturbance that could impact paleontological resources. This long-term impact would generally protect paleontological resources in place. Areas managed as VRM Class III or IV (75% of the RFO under Alternative N) would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which drastically increases the potential for wind and water erosion and the potential for adverse impacts to paleontological resources.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional protection for paleontological resources.

Impacts from Recreation

Recreational activities could have direct and indirect impacts on paleontological resources if these activities occur in areas containing occurrences of scientifically significant surface fossils. Motorized use has the greatest potential to adversely affect paleontological resources because of surface disturbance and associated accelerated erosion. Active management of recreational use within the RFO should minimize these impacts by limiting use in sensitive areas that are more likely to contain scientifically significant surface fossils.

Unlike permitted activities (e.g., mineral development, ROW development) that are subject to site-specific evaluations and monitoring, dispersed recreation activities are not under the same degree of scrutiny prior to use. Because of their widespread occurrence and generally unsupervised nature, casual recreational use would likely result in unmitigated impacts on surface-exposed paleontological resources. Most of this impact would result from unauthorized collecting and vandalism. However, unmitigated impacts could also result from any surface-disturbing aspect of recreation. Dispersed recreation occurs throughout the RFO.

Under this alternative, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no identified special prescriptions that would limit use in areas that contain occurrences of scientifically significant surface fossils. Thus, recreational use within the RFO could result in direct impacts to paleontological resources from unauthorized fossil collecting and vandalism, as well as indirect impacts from increased erosion caused by loss of vegetation cover and by soil compaction.

Impacts from Travel Management

Generally, the more area that is open to OHV use, the greater the potential for adverse impacts to paleontological resources because of surface disturbance and trampling of vegetation, which leads to accelerated erosion. Under Alternative N, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing potential impacts to paleontological resources over a large portion of the RFO. This allowance would decrease vegetation density, increase erosion, and could generally break, spread, and otherwise disturb paleontological resources at the surface. The significance of this impact would depend on the scientific significance of the fossils that could be affected. Mitigation of paleontological resource damage would be accomplished through data-recovery efforts implemented on a case-by-case basis when the damage is discovered.

Motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13% of the RFO). Limiting OHV use to 4,315 miles of designated routes could result in similar impacts. In these areas, impacts from vehicle use off the route would be eliminated, but sites adjacent to routes could be damaged. Designating existing routes that already receive OHV use as open for continued use would not, by the act of designation, result in increased impacts. Because the designated routes currently exist and receive use, additional impacts on or adjacent to them would be minimal. In areas in which OHV use is limited to designated routes, there would be no impacts from OHV use in areas away from the designated routes.

Alternative N would have the greatest potential impacts to paleontological resources because of the large amount of lands open to cross-country motorized use, the most miles of roads (4,315 miles) open to motorized travel, and the fewest miles of roads (65 miles) closed to motorized travel. Road closures,

which would reduce erosion, trampling, vandalism, and other surface-disturbing impacts that damage paleontological resources, could also affect research by limiting access.

Impacts from Lands and Realty

Lands and realty actions could result in the acquisition of surface and subsurface estate, which would bring the estate under federal protection and benefit paleontological resources. Identifying 280 acres as available for sale would make these lands susceptible to long-term indirect and cumulative adverse impacts on paleontological resources by removing scientifically significant fossils from the public domain, thus rendering them permanently unavailable for scientific research and education.

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws would provide protection to paleontological resources from the impacts of mining exploration and development that could damage these resources. Alternative N proposes a total of 169,480 acres of withdrawals. Mining disturbance and associated impacts to paleontological resources would therefore not occur in these areas.

Any new land use authorizations (e.g., ROWs, permits, leases, easements) could impact paleontological resources through surface disturbance (which could directly damage the resource) or through soil compaction and vegetation removal (which could lead to soil erosion and indirect impacts). Under this alternative, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas. Exceptions would be granted only if the proposed authorization would not create substantial surface disturbance or would create only temporary impacts. Thus, impacts to paleontological resources in these avoidance areas would be negligible to minor and would be localized.

Impacts from Minerals and Energy

Development of oil and gas resources could affect paleontological resources because of the surface disturbances associated with such development. Oil and gas would be open to leasing subject to standard terms and conditions and open to leasing subject to moderate constraints (TL, CSU) on 1,645,700 acres (77% of the RFO). Based on the RFD, oil and gas development could impact as much as 8,180 acres over the life of this plan (Appendix 12). In these areas, paleontological resources could be identified prior to oil and gas development if an assessment or inventory was performed, but neither is required under Alternative N. Thus, the potential for significant impacts exists because of the lack of required inventories prior to surface disturbance. Vertebrate or other scientifically significant fossils could be inadvertently damaged from disturbance if they were not identified and avoided.

Surface disturbance associated with the development of salable materials and locatable minerals could impact paleontological resources in a similar manner to the impacts noted for oil and gas development. Under this alternative, 1,668,300 acres would be open to disposal of salable minerals; 1,958,520 acres would be potentially available for mineral location. Paleontological localities could be identified prior to surface disturbance if an assessment or inventory were completed, but neither is required under Alternative N. Thus, the potential would exist for significant impacts to vertebrate or other scientifically significant fossils, which could be damaged inadvertently if they were not identified and avoided.

Paleontological resources in areas that are open to leasing subject to major constraints (NSO) (22,600 acres), closed to leasing (459,700 acres), or closed to disposal of salable minerals (459,700 acres) would be protected from oil and gas development. In addition, paleontological resources in areas withdrawn from minerals entry (169,480 acres) would be protected from potential impacts associated with the extraction of those minerals (see Impacts from Lands and Realty for a discussion of withdrawals).

Impacts from Special Designations

Wilderness Study Areas

WSAs are managed under non-impairment criteria until Congress either designates an area as wilderness or releases it from further consideration. This management effectively provides protection to the paleontological resources in those areas by limiting motorized access and most of the activities that could adversely affect the sites. However, this management also affects research proposals and activities at sites within WSAs; such restrictions on surface disturbance could make paleontological resource studies more difficult. Any activities conducted within a WSA must meet the IMP non-impairment criteria. Anything that would not comply with these criteria (e.g., anything that would impair the suitability of such areas for preservation as wilderness) would not be authorized.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect cultural resources by preventing ground-disturbing activities in the river corridors. Under Alternative N, all eligible segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. This management would benefit paleontological resources by limiting ground disturbance in these areas.

Areas of Critical Environmental Concern

Although ACEC designation alone does not necessarily provide protection, management actions included in ACECs are often more restrictive, thus indirectly providing protection for paleontological resources. Protections that are associated with ACEC designation and that would affect paleontological resources include managing oil and gas leasing as closed to leasing or open to leasing subject to major constraints (NSO); identifying more restrictive VRM designations; and limiting travel. Alternative N continues the designation of four ACECs (14,780 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface disturbing activities within those areas, protecting paleontological resources. Such disallowances include closing the areas to OHV use; managing the areas as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; and acquiring inholdings.

Alternative A

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N, although under Alternative A maximum acreage limits would be set (averaging 73,600 annually for all treatments). Although no maximum treatment acreage limits would be set under Alternative N, it is likely that more acres would actually be treated under that alternative because it allows for the full range of fire and fuels management actions to achieve ecosystem sustainability. Alternative N allows for treatment of vegetation (including mechanical, wildland fire use or prescribed fire, and chemical methods). Alternative A incorporates more mechanical treatment than does either Alternative N or the Proposed RMP.

Impacts from Paleontological Resources

Requiring paleontological assessments prior to permitting surface-disturbing activities in areas that have a high potential for paleontological resources would identify new paleontological localities. Proposed land uses would include actions such as mineral exploration and development (including oil and gas development), development/construction within ROWs, recreation site development, some vegetation treatment projects, some forest/woodland product harvest, or construction of some range improvements. Based on the findings of the assessment, mitigation would be implemented at all phases of development. Although assessments would minimize the potential for unmitigated impacts to known paleontological

resources, assessments would not require an on-the-ground inventory prior to all disturbances. This could result in the inadvertent damage of paleontological resources that were not identified prior to surface disturbance. Inadvertent damage to vertebrate fossils or other scientifically significant paleontological resources would generally be a significant impact, although mitigation could reduce the magnitude of damage, by providing data recovery.

Targeting fossil sites with high scientific value for excavation and curation would ensure that fossil sites with high scientific value are protected either through excavation and data recovery or through increased monitoring. In addition, monitoring high-significance (scientific or interpretive) sites with fossil resources that are not feasible or desirable to excavate or collect would ensure that fossil sites that are important to science and the public would be protected from inadvertent damage or natural deterioration.

Allowing collection of common invertebrate and botanical paleontological resources (except for scientifically significant resources) throughout the RFO could result in the incidental collection of significant resources. However, identifying (and closing to casual collection) areas with rare and significant fossils could reduce impacts caused by incidental collection, compared to Alternative N.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM would be similar to those described under Alternative N. Under Alternative A, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 0 acres would be designated as VRM Class II; 392,800 acres (18%) would be designated as VRM Class III; and 1,288,300 acres (61%) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate to major modifications in the existing character of the landscape, with accompanying surface disturbance and potential inadvertent damage to paleontological resources.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional protection for paleontological resources.

Impacts from Recreation

The establishment of and management associated with SRMAs would provide for management at popular recreation use areas. Management of these areas would decrease the potential for inadvertent damage of paleontological resources, compared to Alternative N.

Under Alternative A, five SRMAs (514,500 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. This management would decrease the potential for inadvertent damage of paleontological resources, compared to Alternative N. Managing the Factory Butte, Big Rock, and Sahara Sands SRMAs for motorized recreational opportunity and allowing moderate to extensive landscape modification would have potentially major impacts and would result in continued impacts to paleontological resources. However, these areas currently receive heavy motorized use, so sites likely are damaged already. Limiting OHV use in the Otter Creek Reservoir and Dirty Devil/Robbers Roost SRMAs to designated routes would limit the extent of potential impacts to paleontological resources.

Alternative A allows vehicles to pull off of designated routes (outside WSAs) 100 feet to either side of the centerline (for parking or staging) and 300 feet to either side of the centerline (for camping). This allowance could result in vehicles generally disturbing paleontological resources at the surface.

Impacts from Travel Management

The types of impacts experienced as a result of travel management decisions under Alternative A would be similar to those described under Alternative N. Limiting OHV use to designated routes on 1,679,000 acres (79% of the RFO) would provide increased protection to paleontological resources, compared to Alternative N. The change from managing most of the RFO as open to cross-country OHV use (under Alternative N) to limiting OHV use to designated routes would decrease impacts. Paleontological resources away from designated routes would be protected from OHV impacts. Rather than the potential for increased disturbance and incidental damage associated with pioneered routes in areas open to cross-country use, impacts on paleontological resources from OHV use on designated routes, as discussed under Alternative N, would be limited to 4,312 miles of designated routes (which is virtually identical to the number designated in Alternative N). In addition, reducing the number of routes open for motorized use would further reduce the accessibility of remote paleontological localities. While such isolation provides indirect protections from inadvertent damage, it also increases the potential for a locality to be damaged through natural deterioration, prior to being identified and recovered. There would be no impacts from OHV use on 68 miles of closed routes.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that fewer acres (154,700 acres) would be recommended for withdrawal under Alternative A. Thus, unavoidable impacts to paleontological resources from minerals activities would be greater under Alternative A than under Alternative N, although sites that are unavoidable would be mitigated.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that Alternative A would designate fewer ROW avoidance areas.

Impacts from Minerals and Energy

Under Alternative A, similar amounts of BLM lands would be closed to fluid mineral leasing (446,900 acres), withdrawn from mineral location (154,700 acres), and closed to mineral material disposal (446,900 acres), as compared to Alternative N, thus resulting in similar impacts.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible river segments would be recommended as suitable, and no special management to protect the outstandingly remarkable values of these rivers would be provided. Thus, the potential for inadvertent damage to paleontological resources from surface-disturbing activities would be greatest under this alternative. However, most of the eligible river segments (98 of the 135 total miles) are also within WSAs, which would provide protection for these resources.

Areas of Critical Environmental Concern

Under Alternative A, no areas would be designated as ACECs. Providing no special management prescriptions would allow surface-disturbing activities within those areas, which could result in inadvertent damage to paleontological resources.

Proposed RMP

Impacts from Vegetation and Fire and Fuels Management

Impacts would the same as those described under Alternative A.

Impacts from Paleontological Resources

Requiring on-the-ground paleontological inventories prior to permitting surface-disturbing activities in areas that have a high potential for paleontological resources would result in the identification, evaluation, and protection (when appropriate) of scientifically significant fossil resources. By focusing on areas that have a high potential, the formation and facies most likely to contain scientifically significant fossils would be scrutinized. If fossil resources are identified, mitigation measures could be applied to protect the resource. Mitigation measures include project relocation or redesign (avoidance) or various scientific data recovery methods, such as recordation, surface collection, subsurface testing, or excavation. These mitigation actions would prevent significant impacts to paleontological resources while increasing the knowledge and understanding of the area's paleontological resources and of the history of life on Earth. In addition, projects such as development and construction within ROWs, recreation site development, or construction of range improvements would be studied prior to implementation.

Requiring assessments in areas that have a medium potential for paleontological resources would allow for mitigation needs to be identified and implemented in areas that are less likely to contain significant fossils. There would be a potential for some localities in areas with a medium potential to be damaged after surface disturbance begins, if a field inventory were not performed. Based on the findings of the assessment, mitigation would be implemented at all phases of development.

As the number of paleontological inventories and assessments increases compared to Alternative A, knowledge of the area's paleontological resources would increase. More paleontological localities would be identified and there would be an associated reduction in the number of localities that could be damaged prior to surface-disturbing activity.

The prioritization for new non-Section 106 inventories in these areas would identify paleontological resources and sites, increasing the database of resources. Compared to Alternative A, the Proposed RMP would increase the knowledge base in this area while providing for improved management of these resources.

Impacts from collection of common invertebrate and botanical paleontological resources would be the same as those described under Alternative A.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under the Proposed RMP, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 249,800 acres (12%) would be designated as VRM Class II; 393,100 acres (18%) would be designated as VRM Class III; and 1,038,200 acres (49%) would be designated as VRM Class IV. The majority of the RFO would be designated as VRM Class III or IV, which could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying surface disturbance and potential inadvertent damage to paleontological resources. However, less of the RFO would be designated in these VRM classes under the Proposed RMP than under Alternative N or A, resulting in less potential impacts, compared to those alternatives.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres would be managed to maintain wilderness characteristics. Management actions would include minimizing or avoiding surface-disturbing activities by taking

measures such as designating the lands as closed to leasing or open to leasing subject to major constraints (NSO), limiting motorized uses to designated routes, or designating the lands as VRM Class II. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to paleontological resources because there would be no vehicular activity or other forms of disturbance that could affect paleontological sites. Protection of non-WSA lands with wilderness characteristics can restrict methods of paleontological site excavations or research activities in areas in which surface-disturbing activities would occur. However, resource inventories would not be precluded, and information gathered from these inventories would increase knowledge of paleontological resources.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A. However, the Proposed RMP would establish five SRMAs (860,390 acres) to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. This alternative proposes only 24,400 acres at Factory Butte and 90 acres at Big Rocks as OHV SRMAs, which would decrease the potential for inadvertent damage of paleontological resources, compared to Alternative A.

The Proposed RMP allows vehicles to pull off of designated routes (outside WSAs) 50 feet to either side of centerline (for parking/staging), and 150 feet to either side of centerline (for camping). Although this allowance could result in vehicles disturbing paleontological resources at the surface, the area of potential impact would be less than under either Alternative N or A.

Impacts from Travel Management

The types of impacts experienced as a result of travel management decisions under the Proposed RMP would be similar to those described under Alternative N. However, the Proposed RMP would allow cross-country OHV use on only 9,890 acres (less than 1% of the RFO). Paleontological resources likely would not be damaged because the areas being proposed for cross-country use have already been subject to disturbance, either through natural processes or human use. Continued disturbance of previously disturbed areas would not result in impacts to paleontological localities.

Limiting OHV use to designated routes on 1,908,210 acres (90% of the RFO) would provide increased protection to paleontological resources, compared to Alternative N or A. Paleontological resources away from designated routes would be protected from OHV impacts. As discussed under Alternative A, rather than the potential for increased disturbance and incidental damage associated with pioneered routes in areas open to cross-country use, impacts on paleontological resources from OHV use would be limited to 4,277 miles of designated routes. There would be no impacts from OHV use on the 209,900 acres (10% of the RFO) closed to OHV use, in areas away from the designated routes, and on the 345 miles of closed routes. In addition, reducing temporary roads associated with temporary projects and reclaiming unnecessary facilities and improvements would further reduce access for paleontological resource study, increasing the isolated nature. While such isolation provides indirect protections from inadvertent damage, it also increases the potential for a locality to be damaged through natural deterioration prior to being identified and recovered.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that more acres (176,200 acres) would be recommended for withdrawal under the Proposed RMP. Thus, unavoidable impacts to paleontological resources from minerals activities would be less under this alternative than under Alternative N.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance areas would be proposed under the Proposed RMP.

Impacts from Minerals and Energy

Under the Proposed RMP, similar amounts of BLM lands would be closed to fluid mineral leasing (447,300 acres), withdrawn from mineral location (176,200 acres), and closed to mineral material disposal (601,800 acres), compared to Alternative N, thus resulting in similar impacts.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect paleontological resources by preventing ground-disturbing activities in the river corridors. Under the Proposed RMP, one suitable segment (5 miles) would be managed to protect its outstandingly remarkable values, free-flowing nature, and tentative classification. This management would protect paleontological resources from inadvertent damage by limiting ground disturbance in this area. The Proposed RMP recommends more suitable river segments than does Alternative A but fewer than does Alternative C or D. Of the remaining segments, 98 miles are within WSAs, leaving 32 miles on which ground-disturbing activities could impact paleontological resources. The Proposed RMP would provide less protection from WSR decisions than would Alternative N, C, or D but more protection than would Alternative A.

Areas of Critical Environmental Concern

The Proposed RMP designates two ACECs (2,530 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within those areas, thereby providing paleontological resources with protection from inadvertent damage. Uses that would be disallowed would include closing the area to OHV use; managing the area as either open to leasing subject to major constraints (NSO), depending on the ACEC; and acquiring inholdings. The Proposed RMP would designate more ACECs than would Alternative A but fewer ACECs than would Alternative C or D.

Alternative C

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A and the Proposed RMP, although under Alternative C fewer acres would be treated annually (averaging 26,000 annually for all treatments). However, Alternative C proposes using only those processes (prescribed fire, biological, and hand cutting) that mimic natural processes to manage vegetation. This restriction would reduce the number of acres treated with methods that directly affect soils, thus reducing the potential for direct damage to paleontological localities.

Impacts from Paleontological Resources

Requiring paleontological inventories throughout the RFO prior to permitting surface-disturbing activities would result in the inventory, identification, and collection of paleontological resources throughout the RFO. Proposed land uses that would require inventories would include actions such as mineral exploration and development (including oil and gas development), development or construction of

ROWs, recreation site development, some vegetation treatment projects, timber harvest, and construction of some range improvements. No surface disturbance would occur until an on-the-ground inventory cleared the area to proceed and until any paleontological resources were identified and avoided or recovered. Therefore, Alternative C would result in lower potential for incidental damage to paleontological resources than would Alternative N or A or the Proposed RMP. In addition, increases in the acres inventoried would result in more identified paleontological localities than under the other alternatives. All impacts that surface-disturbing actions could cause to identified paleontological sites would be mitigated. Impact mitigation would minimize the potential for adverse effects to identified paleontological sites.

The prioritization for new non-Section 106 inventories in these areas would identify paleontological resources and sites, increasing the database of resources. Compared to Alternative N or A or the Proposed RMP, Alternative C would increase the knowledge base in this area while providing for improved management of these resources. Requiring such inventories annually would ensure an increase in the knowledge and understanding of the decision area's paleontological resources. This knowledge and understanding would improve management of these resources.

Allowing collection of common invertebrate and botanical paleontological resources in specifically designated areas would reduce the potential for incidental collection of scientifically significant resources, compared to Alternative N or A or the Proposed RMP. In these areas, non-scientifically significant paleontological resources could be removed. Areas with rare or scientifically significant resources would not be open for personal collection, thus protecting these resources.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative C, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 230,600 acres (11%) would be designated as VRM Class II; 509,100 acres (24%) would be designated as VRM Class III; and 941,400 acres (44%) would be designated as VRM Class IV. Although the majority of the RFO would be designated as VRM Class III or IV, less of the RFO would be designated in VRM Class IV (which allows major modifications to the existing character of the landscape with accompanying surface disturbance) than would be under Alternative N or A or the Proposed RMP, resulting in less potential for inadvertent damage to paleontological resources.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for paleontological resources.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A. However, under Alternative C, four SRMAs (930,000 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. No SRMAs would be established for OHV use under Alternative C, thereby decreasing the potential for damage to paleontological resources from this type of use.

Managing the Dirty Devil/Robbers Roost SRMA (375,800 acres) for dispersed recreation in a primitive setting would indirectly reduce the potential for surface disturbance (and associated damage to paleontological resources) caused by recreation. Managing the Henry Mountains SRMA (533,900 acres) for primitive and semi-primitive recreation and managing the Sevier Canyon SRMA (7,500 acres) for scenic values would indirectly maintain or reduce the potential for disturbance and damage to paleontological resources. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural

recreation experience and the development of facilities could have localized site-specific impacts, although paleontological inventories would be required prior to construction of any facilities.

Alternative C allows vehicles to pull off of designated routes (outside WSAs) 25 feet to either side of the centerline (for parking/staging); camping would be allowed only in designated campsites, with travel between campsites allowed only on designated routes. Together, these restrictions would minimize disturbance to paleontological resources and would result in less disturbance to these resources than would Alternative N or A or the Proposed RMP.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under the Proposed RMP. However, Alternative C would designate no areas as open to motorized vehicles; would limit motor vehicles to designated routes on 1,445,000 acres (68%) of the RFO; and would close 683,000 acres (32%) to motorized vehicle use. The lack of open areas would eliminate impacts that vehicle use could cause to paleontological resources in those areas. Limiting motorized use to designated routes—the public would have access to 3,192 miles of unpaved routes—would generally limit paleontological resource impacts to areas in the immediate vicinity of the designated route; 1,188 miles of routes would be closed, resulting in less potential for damage to paleontological resources in those areas.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that more acres (331,100 acres) would be recommended for withdrawal under Alternative C. Thus, unavoidable impacts that mineral activities might cause to paleontological resources would be less under Alternative C, compared to Alternative N.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance areas (735,000 acres closed to leasing or open to leasing subject to major constraints (NSO), 12 suitable WSR segments, and 16 ACECs) are proposed under Alternative C. Because paleontological inventories would be required prior to permitting all surface-disturbing activities, impacts to paleontological resources would be negligible.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N because a similar amount of acres (1,541,700 acres, or 72% of the RFO) would be open to some category of oil and gas leasing. These categories would include the following: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (TL, CSU), and open to oil and gas leasing subject to major constraints (NSO). This management could result in surface disturbance caused by seismic operations that support oil and gas leases, likely resulting in the identification of paleontological resources in these areas. Upon identification, seismic operations should be able to avoid all the identified sites.

Alternative C allows sale of mineral materials (salable minerals) on 1,541,700 acres (72% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted. Therefore, —any paleontological resources present likely have been significantly altered or destroyed, resulting in loss of information.

Under Alternative C, 586,300 acres would be closed to and closed to disposal of salable minerals; 331,100 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to paleontological resources. Alternative C proposes more acres of mineral withdrawals and more areas closed to leasing or disposal of salable minerals, compared to Alternative N or A or the Proposed RMP. Alternative C would preclude mineral and energy development in those areas and thus provide more protection to these resources.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of suitable WSRs would help protect soil by preventing ground-disturbing activities in the river corridors. All 12 suitable segments (135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under this alternative. Alternative C would also protect paleontological resources from inadvertent damage, by limiting ground disturbance in these areas.

Areas of Critical Environmental Concern

Alternative C designates 16 ACECs (886,810 acres). Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within the areas, thereby providing protection from inadvertent damage to paleontological resources. Management actions that would limit surface-disturbing activities include: closing the areas to OHV use; managing the areas as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; and acquiring inholdings. Alternative C (along with Alternative D) would designate the most ACECs.

Alternative D

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. However, these impacts would occur over a much smaller area because of differences in VRM class designations between the two alternatives. Under Alternative D, 1,129,600 acres (53% of the lands managed by the RFO) would be designated as VRM Class I; 66,700 acres (3%) would be designated as VRM Class II; 355,100 acres (17%) would be designated as VRM Class III; and 576,600 acres (27%) would be designated as VRM Class IV. Just more than half of the RFO would be designated as VRM Class I or II, meaning that the existing character of the landscape must be preserved or retained. Thus, surface-disturbing activities (and potential inadvertent damage to paleontological resources) would generally not be allowed in these areas, resulting in reduced potential for damage to these resources, compared to Alternative N, A, or C or the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres would be managed to maintain wilderness characteristics. Management actions would include minimizing or avoiding surface-disturbing activities by closing the lands to leasing, closing the lands to OHV use, or designating the lands as VRM Class I. The emphasis on naturalness and a lack of surface-disturbing activities within these areas would minimize impacts to paleontological resources because there would be no vehicular activity or other forms of disturbance that could affect paleontological sites. Protection of wilderness characteristics lands could also preclude paleontological site excavations or research activities where surface disturbing activities would occur. However, resource inventories would not be precluded, and information gathered from these inventories would increase knowledge of paleontological resources. Alternative D would also close OHV access to known paleontological sites that are visited as a recreational activity within these non-WSA areas. Of all the alternatives, Alternative D would provide the most protection for paleontological resources.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described for Alternative C, except that seven SRMAs (1,358,100 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. No SRMAs would be established for OHV use, thereby decreasing the potential for damage that this type of use could cause to paleontological resources. As described under Alternative C, the development of facilities could have localized site-specific impacts, although paleontological inventories would be conducted prior to construction of any facilities, thereby allowing for avoidance or mitigation of sites.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. However, Alternative D would limit motorized use to designated routes on 972,800 acres (46% of the RFO) and would close 1,155,200 acres (54%) to motorized vehicle use. The lack of open areas would eliminate impacts caused by vehicle use to paleontological resources in those areas. Limiting motorized use to designated routes—the public would have access to 3,043 miles of unpaved routes—would generally limit soils impacts to areas in the immediate vicinity of the designated route; 1,242 miles of routes would be closed, allowing protection of paleontological resources in those areas.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative N.

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that more acres (903,900 acres) would be recommended for withdrawal under Alternative D. Thus, unavoidable impacts that minerals activities could cause to paleontological resources would be significantly less under Alternative D, compared to Alternative N.

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance/exclusion areas (1,203,800 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments, and 16 ACECs) would be proposed under Alternative D. These avoidance/exclusion areas would encompass 57% of the RFO, thereby providing more protection to paleontological resources (through reduction in inadvertent impacts) than under any of the other alternatives.

Impacts from Minerals and Energy

The types of impacts experienced as a result of minerals and energy management would be similar to those described under Alternative N. However, these potential impacts would occur over a substantially

smaller area under Alternative D; 967,500 acres (45% of the RFO) would be open to some category of oil and gas leasing. These categories include the following: open to leasing subject to the standard terms and conditions, open to leasing subject to moderate constraints (TL, CSU), and open to oil and gas leasing subject to major constraints (NSO).

Alternative D allows sale of mineral materials (salable minerals) on 967,500 acres (45% of the RFO). Because existing areas of salable mineral disposals have already been substantially impacted, any cultural resources present likely have been significantly altered or destroyed, resulting in loss of information. However, new sites would be subject to paleontological inventories; identified sites would either protect the site through avoidance or result in mitigation (scientific data recovery).

Under Alternative D, 1,160,500 acres would be closed to leasing and closed to disposal of salable minerals; 903,900 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent these types of activity from causing impacts to paleontological resources. Alternative D proposes more acres of mineral withdrawals and more areas closed to leasing or to disposal of salable minerals than any of the other alternatives.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

4.3.7 Visual Resources

The BLM's VRM class objectives were used to analyze impacts on visual resources. These objectives provide a baseline for determining how much a proposed management action would affect visual resources or scenic quality, as well as for determining the level of disturbance that an area can support while still meeting visual resource objectives.

The following BLM VRM class objectives and descriptions are summarized from *BLM Manual Handbook H-8431-1* (1986).

- **VRM Class I.** The objective of Class I is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activities. The level of change to the characteristic landscape should be very low and should not attract attention.
- **VRM Class II.** The objective of Class II is to retain the existing character of the landscape. The level of change to the landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes to the landscape must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
- **VRM Class III.** The objective of Class III is to partially retain the existing character of the landscape. The level of change to the landscape should be moderate. Management activities may attract the attention of the casual observer, but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
- **VRM Class IV.** The objective of Class IV is to provide for management activities that require major modifications to the existing character of the landscape. The level of change to the landscape can be high. The management activities may dominate the view and may be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repetition of the basic visual elements of form, line, color, and texture.

Visual resource inventories were completed before each of the planning efforts for the existing LUPs. These inventories were used to generate the existing VRM objectives for the lands managed by the RFO (Map 2-1). Landscape and the visual resource conditions may have changed since these objectives were set. Currently, WSAs are managed under a number of VRM classes. In accordance with BLM IM-2000-096, all WSAs would be managed as VRM Class I following completion of this Proposed RMP.

The criteria for analysis were the number of acres proposed for designation under the VRM classes, and the level of impacts and surface disturbances permitted under each class. Analyses of the impacts on visual resources are discussed in terms of the number of acres in each VRM category because management actions under the Proposed RMP would be required to comply with (e.g., not exceed) the approved VRM class objectives.

Methods and Assumptions

The following assumptions are made regarding future management of visual resources:

- Activities proposed that would not initially meet VRM objectives for the area would be mitigated to the extent needed to meet the objectives. Proposed activities that could not be mitigated would not be authorized.

- The greater the size or severity of surface disturbance, the greater the impact there would be to scenic quality.
- All actions proposed during the Proposed RMP process must consider the importance of the visual values and the effects that the project may have on these values.

VRM class designations by alternative are shown in Table 4-14.

Table 4-14. VRM Classes, Acres, and Percentage of RFO Lands

VRM Class	Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	0 acres * (0%)	446,900 acres (21%)	446,900 acres (21%)	446,900 acres (21%)	1,129,600 acres (53%)
Class II	529,500 acres (25%)	0 acres (0%)	249,800 acres (12%)	230,600 acres (11%)	66,700 acres (3%)
Class III	569,000 acres (27%)	392,800 acres (18%)	393,100 acres (18%)	509,100 acres (24%)	355,100 acres (17%)
Class IV	1,029,500 acres (48%)	1,288,300 acres (61%)	1,038,200 acres (49%)	941,400 acres (44%)	576,600 acres (27%)

* By BLM policy, WSAs are managed to meet VRM Class I objectives.

Environmental Consequences

Impacts to Visual Resources would result from actions proposed under the following resource management programs:

- Air Quality, Soil Resources, and Water Resources
- Vegetation and Fire and Fuels Management
- Cultural Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Non-WSA Lands with Wilderness Characteristics
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on visual resources.

Alternative N: No Action

Impacts from Air Quality, Soil Resources, and Water Resources

Implementing appropriate BMPs to minimize surface disturbance (Appendix 14) would reduce visual contrasts created by a variety of resource management projects. Both short- and long-term impacts would be localized. Actions to improve riparian and watershed condition in areas of moderate to severe erosion

would affect visual resources in a manner similar to those described under Impacts from Vegetation and Fire and Fuels Management.

Alternative N precludes surface-disturbing activities within 500 feet around natural springs, for the purpose of protecting water quality. This preclusion would also protect visual resources by retaining the existing character of the landscape in those areas.

Requiring the mitigation of impacts caused by fugitive dust during surface-disturbing projects would help maintain visual resource conditions.

Impacts from Vegetation and Fire and Fuels Management

Over the long term, restoration and vegetation treatments designed to improve ecological conditions could indirectly enhance visual resources, on a localized basis. However, in the short term, methods used to achieve improved ecological conditions could directly create visual changes to landscape form, line, color, and texture. Such impacts would range from minor to moderate, depending on the scope and magnitude of treatment and the methods used. Chemical and biological methods would tend to gradually create visual contrasts that mimic natural ecological change, whereas fire and mechanical methods would create such contrasts more suddenly and noticeably. Depending on the VRM class of the area in which a particular treatment is conducted, impacts to the landscape could either meet or not meet the visual objective for the class. For example, treatments that create moderate change in VRM Class III areas would likely meet the visual standard, whereas moderate change that attracts attention in a VRM Class I or II area would not. Alternative N allows for a full range of treatment methods (including mechanical, wildland or prescribed fire, and chemical methods). Some of the proposed treatment methods (e.g., mechanical, chemical) would result in localized, short-term impacts to visual resources, by creating visual contrasts.

Impacts to visual resources from prevention and mitigation programs aimed at reducing unwanted ignitions in wildland fire use and non-wildland fire use areas would be similar to those described for vegetation treatments. However, actions related to prevention could reduce human-caused ignitions and related visual impacts caused by fire. Post-fire rehabilitation methods, such as seed drilling, mulching, netting, or hydroseeding, could directly result in localized visual contrasts. Impacts would be minor to moderate in the short term but would become negligible in the long-term. Wildland fires and prescribed fires would result in smoke, causing short-term, minor-to-moderate impacts on visual resources. Such fires would also affect visual resources because of increased vehicle traffic, fire lines, and the contrast between burned and unburned areas. The latter could vary in size from a few acres to tens of thousands of acres.

Noxious weeds could affect visual resources to a minor degree by replacing native vegetation and creating changes in existing landscape form, color, or texture. Efforts to control or eliminate noxious weeds would reduce such impacts. Visual impacts created by the localized, small-scale collection or use of vegetative materials would be negligible. However, any vegetation removal associated with larger-scale research or restoration efforts could produce impacts similar to those described for mechanical vegetation treatments.

Impacts from Cultural Resources

The protective management of cultural resources would generally complement the maintenance of landscape character and the conservation of visual resources. When excavation or restoration measures involve surface- or vegetation-disturbing activities, noticeable contrast or reduced scenic quality ratings could result. Impacts would be direct, localized, and short term and would depend on the type, scope, and magnitude of the excavation or restoration and the amount of change that it would cause to existing landscape form, line, color, or texture. The potential for reducing or restricting public access to cultural

resources could reduce public opportunities to view some scenic resources. Such reduced opportunities would depend on the type and location of the restriction and its overlap with known scenic viewing locations.

Impacts from Visual Resources

Alternative N represents the VRM classes currently in place. Per BLM policy, WSAs would be managed as VRM Class I under all action alternatives, to preserve their scenic value. Areas managed as VRM Class I would experience little to no change to their landscape character and, thus, to their scenic value. Areas managed as VRM Class IV would allow for major modifications of the landscape.

Use of the VRM contrast rating process would continue to provide site-specific visual analysis of proposed surface-disturbing activities, to ensure that such projects meet visual objectives in project areas (through design features or mitigation). Both short- and long-term, indirect effects would accrue over the life of the Proposed RMP as management practices were constrained by the contrast rating process to sustain or enhance visual landscapes. Proposals would be required to mitigate impacts to scenic quality through project design (such as requiring new facilities to be painted to blend in with the surrounding landscape) and location and to conform to the designated VRM class objectives. Under Alternative N, actions to restore natural conditions or appearance in areas that were already modified may succeed on a localized basis, reducing some visual contrast in the long term.

Impacts from Special Status Species

Alternative N (along with all the other alternatives) prohibits actions that destroy, adversely modify, or fragment federally listed species habitat; proposes habitat improvements for SSS; and considers SSS habitat in all wildland fire suppression efforts.

The protective management prescribed for SSS (including those relating to riparian habitats, ACECs, and non-ACEC habitats) would generally complement the maintenance of landscape character and the conservation of visual resources. However, restoration measures that involve surface- or vegetation-disturbing components would create noticeable contrast or reduce scenic quality ratings. Such impacts would be direct and short term and could range from minor to moderate, depending on the type of treatment or restoration and the amount of change that it would cause to existing landscape form, line, color, or texture. Reducing or restricting public access in SSS habitats could reduce public opportunities to view some scenic resources. Impacts would be direct and long term and could range from negligible to moderate, depending on the type and location of the restriction and its overlap with known scenic viewing locations.

Impacts from Fish and Wildlife

Alternative N (along with all the other alternatives) includes provisions to avoid or reduce habitat fragmentation. These provisions could include collocating facilities, employing directional drilling, reclaiming redundant roads, reclaiming roads no longer serving their intended purpose, or using topographic and vegetation screening to reduce the influence of intrusions. These measures would generally complement the maintenance of landscape character and the conservation of visual resources. However, restoration measures that involve surface- or vegetation-disturbing components would create noticeable contrast or reduce scenic quality ratings. Such impacts would be direct and short term and could range from minor to moderate, depending on the type of treatment or restoration and the amount of change that it would cause to existing landscape form, line, color, or texture.

Constructing or modifying wildlife water developments could create visual contrasts with surrounding landscapes. Impacts would be localized and long term, depending on the placement, design, and use of native materials and the area's VRM class designation.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for visual resources.

Impacts from Livestock Grazing

Where livestock grazing would continue to be authorized (1,989,048 acres of the RFO), the installation of additional fences or livestock improvements (cattle guards, water developments, and roads necessary to access improvement sites) could directly impact visual resources by adding forms, lines, colors, and textures not found in the surrounding landscape. Such impacts would be localized, long term, and could range from negligible to moderate. Where livestock grazing would not be available (138,952 acres), the potential for these impacts would be eliminated, effectively maintaining visual resource integrity over the long term. Any removal of livestock facilities in these areas would enhance visual resources in the long term, by bringing the area back into its natural or near-natural condition.

Areas in which livestock tend to congregate would create contrasts that would be noticeable to the casual observer. These impacts would typically be long-term, direct, and localized. Implementing Utah's SRH would increase the potential for directly improving or enhancing visual resources.

Impacts from Recreation

Overall recreation guidance, ERMA management decisions, and the continued issuance of special recreation permits would not affect visual resources. No specific facilities are proposed, but any constructed would be based on needs for resource protection and user demand. New facilities or new types of commercial activities could result in changes to the landscape. However, specific projects are not identified at this time and therefore cannot be analyzed.

SRMAs would likely attract more visitor use to the RFO in the long term. Increased visitor use could generate localized visual contrasts in the form of dust from traffic, changes to camping areas, and potential impacts from illegal, off-road driving. More intensive management of these areas could enhance public access to scenic views and overlooks. SRMA management decisions could affect scenic resources. Under Alternative N, only a portion of the existing Yuba Reservoir SRMA would be within the RFO. However, this SRMA is administered by the Fillmore FO and is not analyzed in this Proposed RMP.

Recreational activities would have site-specific impacts near frequent and high-use areas such as campgrounds, parking lots, trailheads, and other recreation-related use areas. Long-duration trail use (e.g., walking, equestrian, OHV, mountain biking) could result in loss of vegetation cover, especially during wet periods, Large-group recreation events and camping could compact soils, leading to changes in plant vigor. These impacts would change the characteristic landscape and would be site-specific and localized. Dispersed recreation activities would create less impacts to visual resources than would these more intensive, concentrated recreation uses. Closing or rehabilitating undeveloped sites would restore the visual resources of those sites.

Impacts from Travel Management

The designation of OHV open areas could cause adverse impacts to landscapes and visual values. The level of use, season of use, type of soil, and vegetative community all could influence the amount of change to the landscape. Cross-country OHV use could result in visual contrasts in color because of disturbed soils and vegetation and contrasting linear disturbance on the landscape. The length of time observed and distance from important viewpoints could influence the perceived changes to the overall visual values.

Under Alternative N, 1,637,000 acres (75% of the RFO) would remain open to cross-country OHV use: 206,000 acres in VRM Class II; 489,000 acres in VRM Class III; and 942,000 acres in VRM Class IV. Although the landscape in many areas would not be impacted by cross-country use because of topographic and vegetation limitations, continuing to manage this large area as open would allow the greatest potential for changes to the landscape and impacts to scenic resources because of soil disturbance, tire tracks, and hill climbs, all of which would be inconsistent with the objectives for VRM Class II. The open OHV acreage is significantly higher in Alternative N than any of the other alternatives. There would be 214,000 acres (10% of the RFO) that would be closed to OHV use under this alternative (primarily within WSAs), precluding scenic impacts from OHV use on those lands.

Under Alternative N, motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO. OHV routes create visible lines on the landscape. Depending on topography, the vegetation community, and observation point(s), those lines are visible to varying degrees. Further, removal of vegetation would reveal the underlying soil, which often contrasts with the surrounding vegetation in both color and texture. This contrast would further accentuate the change to the landscape. In those areas in which OHV use is limited to designated routes, management would limit impacts on the landscape to the existing transportation system and would eliminate the creation of new routes that would result in further changes to the landscape and visual quality. Alternative N would allow the use of 4,315 miles. The designation of existing routes would protect visual resources by reducing the potential for the creation of additional routes and changes to the landscape, such as soil disturbance, erosion, and loss of vegetation.

The potential for cross-country access to dispersed campsites to cause additional changes to the landscape would be greatest under Alternative N. Dispersed camping and cross-country access to these campsites would be allowed to take place anywhere outside the WSAs. Existing sites with access would continue to be used, but the number of these sites could increase under this alternative, causing changes to the landscape.

Impacts from Lands and Realty

Land tenure decisions include both the disposal and acquisition of land. The 203 Sales maps 2-21through 2-26 are in the map section of Volume III of the PRMP/FEIS. When public lands are disposed of, BLM no longer controls the scenery, and development could affect the visual qualities of adjoining public lands. Because it is unknown which lands (if any) might be sold, it is unknown whether those lands would be of high value because of visual interest. When BLM acquires lands, it also acquires responsibility for the scenery. Acquired lands would be managed according to VRM objectives on adjoining parcels. Under Alternative N, as much as 280 acres could leave federal ownership through FLPMA sales. Although BLM would no longer control the scenery on lands disposed of by FLPMA Section 203 sales, and although their development could create minor-to-major, long-term, direct, localized visual contrasts with the surrounding landscape, the lands identified for sale are usually isolated, difficult-to-manage parcels or are adjacent to developed areas in established communities. Therefore, these lands would have less potential of being high value for visual interest, so the potential for the loss of public viewing of scenic resources on these lands would be low.

Impacts to visual resources could result from issuance of land use authorizations (e.g., ROWs, permits, leases, easements). Impacts from issuance of these authorizations would vary based upon the nature and purpose of the authorization and the amount of change it would cause to existing landscape form, line, color, or texture. These authorizations could include a reduction in scenic quality ratings. Impacts generally would be minor to moderate and would be addressed in site-specific NEPA analysis. Under Alternative N, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas. Exceptions would be granted only when the proposed

authorization would not create substantial surface disturbance or would create only temporary impacts. Thus, impacts to visual resources in these avoidance areas would be negligible to minor and localized.

When possible, new ROW and communication sites would be collocated in existing corridors or sites. Although such developments could change landscapes, collocating new development with existing facilities would protect undisturbed areas from visual intrusions.

If wind or solar energy were developed in the lands managed by the RFO, it would impact visual resources. Introducing large wind structures or solar arrays would be a noticeable change to the landscape. Under Alternative N, exploration and development would be considered on a case-by-case basis. Because of the potential for a great level of change to the landscape, these developments would be consistent only with VRM Class IV objectives.

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws could prevent major modification to the landscape. However, the identified withdrawals, if established, would be subject to valid existing rights, which could result in disturbance and associated impacts to visual resources in these areas. Alternative N proposes a total of 169,480 acres of withdrawals.

Impacts from Minerals and Energy

Leasable Minerals

Table 4-15 presents the RFD scenario for oil and gas for lands managed by the RFO. Under all alternatives, the RFD projects that 454 oil and gas wells would be developed within the planning area, which includes all land ownerships, during the next 15 to 20 years.

Table 4-15. Reasonably Foreseeable Development Scenario for Oil and Gas

Development Potential	Well Locations	# of Wells Predicted	Geophysical Surface Impacts	Well Surface Impacts	Total Surface Impacts
High (Area 4) Western Sevier and Sanpete Counties	BLM 45% Private 40% USFS 10% State 5%	360	4,500 acres	540 acres	5,040 acres
Moderate (Area 3) Eastern Sevier and Sanpete Counties	USFS 100% (Fishlake and Manti-LaSal National Forests)	49	360 acres	1,100 acres	1,460 acres
Low (Areas 1 & 2) Piute, Wayne, eastern Garfield, and southern Sevier Counties	BLM 100%	45	240 acres	1,440 acres	1,680 acres
Totals		**454**	**5,100 acres**	**3,080 acres**	**8,180 acres**

In the area with high development potential (western Sevier and Sanpete Valleys), the construction of roads, well pads, and other facilities would add further developments to a moderately altered landscape. These agricultural valleys consist of cultivated fields, roads, and rural towns bordered by rolling hills and mountains. Many of the developments would be visible and would attract attention, which would result in changes to the existing visual resources.

The area with moderate development potential (eastern Sevier and Sanpete Counties) generally has a natural-appearing landscape but allows for screening of most projects because of topography and vegetation. Road construction in these areas could require more cutting and filling, which would be more visible on the landscape. However, this area would still contain relatively few wells, with few disturbance acres spread over a large area, resulting in minimum impacts to visual resources.

The area with low development potential is generally more remote, with natural-appearing landscapes, and visitors may be more sensitive to landscape changes. Therefore, a few wells spread over such a large area would have a minimal impact on visual resources. The overall landscape character and vistas would not change.

Locatable Minerals

Exploration and development of locatable minerals create surface disturbances that could adversely impact visual resources. Impacts to visual resources would be unavoidable because of major surface-disturbing activities to mine for the mineral sources. However, little development of locatable minerals is expected during the next 15 to 20 years.

Withdrawals would reduce the amount of land open to disturbance. Alternative N proposes a total of 169,480 acres of withdrawals. See Impacts from Lands and Realty for a discussion of withdrawals.

Salable Minerals

Salable minerals are under the same restrictions as oil and gas resources. The same lands that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) would be available for salable mineral disposal, just as those lands that are either closed to leasing or open to leasing subject to major constraints (NSO) would be unavailable for salable mineral disposal. Under Alternative N, 459,700 acres would be closed to disposal of mineral materials and 169,480 would be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts to scenery because no surface-disturbing activities associated with mining of salable minerals would be allowed in those areas.

Impacts from Special Designations

Wilderness Study Areas

Managing WSAs under the IMP would prevent most ground-disturbing activities. This management would contribute to preservation of the existing landscape character to a major degree over the long term.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect visual resources by preventing ground-disturbing activities that would impact the scenic character in the river corridors. Under Alternative N, all eligible segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. This management would preserve the existing character of the landscape in these areas.

Areas of Critical Environmental Concern

Although ACEC designation alone does not necessarily provide protection, the management actions included in ACECs are often more restrictive, thus indirectly providing protection for visual resources. Protections associated with ACEC designation that would affect visual resources include managing oil and gas leasing as closed to leasing or open to leasing subject to major constraints (NSO), implementing more-restrictive VRM designations, restricting livestock grazing to protect relict vegetation and ecologic (riparian) values, and limiting travel limitations. Alternative N continues the designation of four ACECs

(14,780 acres). Scenery was not one of the relevant and important values identified for these ACECs. However, allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within those areas and thus protect visual resources. Such disallowance could include closing the areas to OHV use; managing the area as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; making the area unavailable for livestock grazing in ACECs with relict vegetation and ecologic relevant and important values; and acquiring inholdings.

Alternative A

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N. However, under Alternative A, the buffer zone of areas closed to leasing subject to major constraints (NSO) around springs would be 330 feet. Therefore, this alternative would protect a smaller area (8 acres) from changes to the characteristic landscape than would Alternative N (18 acres).

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N, although under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually for all treatments). Although no maximum treatment acreage limits would be set under Alternative N, more acres probably would be treated under that alternative because it allows for the full range of fire and fuels management actions to achieve ecosystem sustainability and allows for a full suite of treatment methods (including mechanical, wildland fire use or prescribed fire, and chemical methods). Alternative A incorporates more mechanical treatment than does Alternative N or the Proposed RMP.

Potential visual effects that could result from a severe wildfire include loss of trees, blackening of the landscape, and blackened deadfall, including the disruption of line and form caused by ground-disturbing activities. Large areas, including areas in VRM Classes I and II, could be blackened and charred, and large amounts of smoke could be produced.

Impacts from Cultural Resources

Under Alternative A, all cultural properties in the RFO are allocated to one of six uses (scientific, conservation, traditional, public, experimental, or discharged from management). These use allocations pertain to the cultural resources themselves rather than to areas of land, so impacts that management of cultural resources would cause to visual resources would be similar to those described for Alternative N. However, under Alternative A, the majority of cultural resource site types would be allocated to public use, thereby providing increased public access to cultural resources and increased public opportunities to view these resources.

Impacts from Visual Resources

VRM class designations vary by alternative (Table 4-14). Under Alternative A, all areas outside of WSAs would be designated as VRM Class III or Class IV. These designations mean that there could be moderate changes to the landscape (on 392,800 acres designated as Class III) or major changes to the existing character of the landscape (on 1,288,300 acres designated as Class IV). Of all the alternatives, Alternative A could have the most impact on visual resources.

Impacts from Special Status Species

The types of impacts experienced as a result of SSS management would be similar to those described under Alternative N. However, Alternative A includes additional strategies to avoid or reduce

fragmentation of habitat. These strategies could include employing directional drilling for oil and gas, closing and reclaiming roads, mitigating the effects of proposed projects that could cause long-term or permanent impacts or losses of habitat, and using species-specific buffers for surface-disturbing activities. All these actions would reduce surface disturbance and reduce the potential for invasion and spread of invasive species, thereby helping to maintain the visual character of the landscape.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative A, resulting in no additional protection for visual resources.

Impacts from Livestock Grazing

Impacts would be essentially the same as those described under Alternative N, except that under Alternative A, an additional 36,950 acres (less than 1% of the RFO) would be available for livestock grazing. Installation of additional fences or livestock improvements (cattle guards, water developments, and roads necessary to access improvement sites) on these acres could directly impact visual resources by adding forms, lines, colors, and textures not found in the surrounding landscape. Such impacts would be localized, long-term, and could range from negligible to moderate. Where livestock grazing would not be available (102,002 acres), the potential for the these impacts would be eliminated, effectively maintaining visual-resource integrity over the long-term. Any removal of livestock facilities in these areas would enhance visual resources in the long term by bringing the area back into its natural or near-natural condition.

Impacts from Recreation

The types of impacts experienced as a result of recreation management decisions would be similar to those described for Alternative N. However, under Alternative A, SRMAs would be established that provide for cross-country OHV activities at Otter Creek (the west side of the reservoir), Big Rocks, Factory Butte, and Sahara Sands. Allowing cross-country activities and providing necessary facilities would enhance and probably increase use in these areas, resulting in changes to the landscape (developments such as staging areas, restrooms, and increased vehicle tracks). Terrain, soils, season of use, and distance from main travel routes would influence the noticeability of these changes. To be consistent with these uses, these areas would be designated as VRM Class IV.

The Dirty Devil/Robbers Roost SRMA (290,000 acres) would be established to provide for recreational experiences complementary with the remote and scenic nature and other resource values of the area. No site developments, or only the minimum required for site protection, and no onsite interpretive facilities would be proposed for this area. The management objectives for this SRMA would help preserve the landscape characteristics in this area.

Impacts from Travel Management

The designation of OHV open areas can cause adverse impacts to landscapes and visual values. The level of use, season of use, type of soil, and vegetative community influence the amount of change to the landscape. The length of time observed and distance from important viewpoints can influence the perceived changes to the overall visual values.

Under Alternative A, 449,000 acres (21% of the RFO) would remain open to cross-country OHV use. The open OHV acreage is significantly less under this alternative than under Alternative N, but substantially greater than under Alternative C or D or the Proposed RMP. Although topographic and vegetation

limitations in some areas would prevent impacts by cross-country use, continuing to manage this large area as open would allow the greatest potential for changes to the landscape and impacts to scenic resources as a result of soil disturbance, tire tracks, and hill climbs.

Areas not designated as open to OHV use would be limited to designated routes, thereby minimizing impacts to visual resources on the 1,679,000 acres within the limited category. Limiting vehicles to designated routes would reduce the potential for additional changes to the landscape, such as soil disturbance, erosion, and loss of vegetation, although intermittent dust from use of these unpaved routes and visibility of lines in the landscape would still be apparent. The potential impacts identified in Alternative N from cross-country motorized access to dispersed campsites would not be present under Alternative A on the areas designated as limited to OHV use—vehicles on existing spur routes to established campsites would be allowed within 300 feet of the centerline of designated routes. No new campsites or travel ways would be authorized, resulting in no effect to visual resources.

Under Alternative A, no lands would be closed to OHV use, with no accompanying benefits to visual resources.

Impacts from Lands and Realty

The types of impacts experienced as a result of land tenure adjustments under Alternative A would be similar to those described under Alternative N, except that as much as 13,460 acres could potentially leave federal ownership through FLPMA Section 203 sales. Although the BLM would no longer control the scenery on lands disposed of by Section 203 sales and their development could create minor-to-major, long-term, direct, localized visual contrasts with the surrounding landscape, the lands identified for sale are usually isolated, difficult-to-manage parcels or are adjacent to developed areas in established communities. These lands therefore would have less potential of being of high value for visual interest, so the potential for the loss of public viewing of scenic resources on these lands would be low.

Under Alternative A, there would be no new withdrawals from mineral entry considered and therefore no additional benefits to scenic resources, compared to Alternative N.

The types of impacts experienced as a result of issuing lands use authorizations would be similar to those described under Alternative N, although impacts could occur over a larger area because less acres would be proposed for ROW avoidance areas (446,900 acres closed to leasing).

Wind or solar energy development would be considered throughout the lands managed by the RFO, except for WSAs (VRM Class I). Introducing large wind structures and solar arrays would be a noticeable change to the landscape. Because of the potential for a high level of change to the landscape, these developments would be consistent only with VRM Class IV objectives (1,288,300 acres, or 61% of the RFO). Introducing these developments in VRM Class II and III areas would be inconsistent with the objectives for those VRM classes, and would therefore adversely affect visual resources. Alternative A would have the greatest potential impact to visual resources.

Impacts from Minerals and Energy

Leasable Minerals

The types of impacts experienced as a result of leasable minerals development would be similar to those described under Alternative N. Development of oil and gas resources could affect scenic landscapes because of the surface disturbances associated with such development. However, designating areas as closed to leasing (446,900 acres) and designating fewer acres than Alternative N as open to leasing subject to major constraints (NSO) (0 acres) would provide less protection to visual resources by precluding fewer surface-disturbing activities.

Locatable Minerals

The types of impacts experienced as a result of locatable minerals activities would be similar to those described under Alternative N, except Alternative A recommends fewer acres of mineral withdrawals (154,700 acres). Thus, impacts associated with locatable minerals mining could occur over a larger area of the RFO.

Salable Minerals

The types of impacts experienced from disposal of salable minerals would be similar to those described under Alternative N, except that Alternative A proposes fewer acres of mineral withdrawals (154,700 acres), fewer areas closed to salable mineral disposal (446,900 acres), and fewer areas open with restrictions (0 acres). Thus, impacts associated with disposal of salable minerals could occur over a larger area of the RFO.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible river segments would be recommended as suitable. No special management to protect the outstandingly remarkable values of these rivers would be provided, so visual resources within these corridors would not be protected by WSR designation from ground-disturbing activities in the river corridors. However, most of the eligible river segments (98 of the 135 total miles) are also within WSAs, so ground-disturbing activities would not occur in those river corridors and the scenic landscape would be protected.

Areas of Critical Environmental Concern

Alternative A designates no ACECs, so no special management (e.g., managing oil and gas leasing as closed to leasing or open to leasing subject to major constraints (NSO), more restrictive VRM designations, travel limitations) to protect the scenic landscape is proposed. Allowing surface- disturbing uses that could cause irreparable damage to the relevant and important values in these areas could impact visual resources.

Proposed RMP

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those under Alternatives N and A, (as described under Alternative N). The Proposed RMP would have a buffer zone of 330 feet on each side of the waterway or 100 yard flood plain whichever is greater, potentially offering more protection than Alternative N or A.

Impacts from Vegetation and Fire and Fuels Management

Under the Proposed RMP, vegetation treatment strategies that are consistent with managing scenic quality on public land would be implemented. These treatments would reduce the risk of severe wildfire that could potentially affect all visual classes and result in impacts on visual resources. Large, severe wildfires change the landscape in a way that could degrade visual quality, especially on fragile soils on which the duration of erosion impacts may be longest.

Allowing fire to resume a more natural, ecological role across the landscape may constitute a short-term conflict between ecological sustainability and scenic aesthetics. However, recent studies have shown public support for controlled burns and other fuels-reduction methods to reduce the risk of larger,

uncontrolled burns (USDA 2003). Resource values and short-term visual impacts versus long-term improvement in visual character of the landscape would be considered in planning fire and fuels management activities.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative A. However, under the Proposed RMP, fewer sites would be allocated to public use, thus providing decreased public access to cultural resources and decreased public opportunities to view these resources.

Impacts from Visual Resources

Under the Proposed RMP, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 249,800 acres (12%) would be designated as VRM Class II; 393,100 acres (18%) would be designated as VRM Class III; and 1,038,200 acres (49%) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate-to-major modifications in the existing character of the landscape. However, under the Proposed RMP, less of the RFO would be designated in these VRM classes than under Alternative N or A, resulting in less potential impacts to visual resources, compared to those alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres in 12 areas would be managed to protect their wilderness characteristics (size, naturalness, opportunities for solitude, and opportunities for primitive forms of recreation). These lands would be designated as VRM Class II, to retain the existing character of the landscape. These areas would be managed to minimize surface-disturbing activities, thus preventing changes to the characteristic landscape (vegetation, landform, and water) and protecting the scenic quality of these lands.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts that would be experienced under the Proposed RMP would be similar to those described under Alternative A. Under the Proposed RMP, established SRMAs would provide for cross-country OHV activities at Factory Butte and Big Rocks. Management actions would focus on the OHV activities in these areas and the development of facilities to support the motorized activities. Allowing cross-country activities and providing necessary facilities would enhance and probably increase use in these areas, which would result in changes to the landscape (developments such as staging areas, restrooms, and increased vehicle tracks). Terrain, soils, season of use, and distance from main travel routes would influence how noticeable these changes are. These changes would be more apparent at Factory Butte than Big Rocks because of the terrain and proximity to a main highway.

The kiosks and loading/unloading ramps in the Factory Butte SRMA (Appendix 18) would be screened from Highway 24 by low hills in the foreground. They would be seen for only a few seconds, if at all, by highway traffic. For motorized visitors using the open OHV area, the noticeability of the improvements

would vary, depending on the visitor's vantage point. The upgraded entrance, kiosk, and ramps would be noticeable as visitors enter the area and use these facilities. As visitors travel further into the area, the improvements would not be as noticeable from a distance. From many locations within the open area, the structures would be partially or often totally hidden because of terrain. The fences would be most noticeable to riders as they approach these boundaries. For safety reasons, the fences must be noticeable enough to keep riders from running into them. These improvements would be seen but would not dominate the landscape or attract the attention of visitors unless the visitors were in close proximity to the structures.

Although various structures are planned within VRM Class II and Class III areas, topographic screening would be used whenever possible. Elements would be added to the landscape, but would not be expected to dominate the landscape or view. No changes to the overall landform or vegetation would occur. The contrast caused by the addition of structures would be moderate to weak for some elements of the landscape and would be nonexistent for other elements. The added facilities in the Factory Butte SRMA would be consistent with VRM Class II and Class III objectives in as much as improvements would be seen but only for short durations and should not attract the attention of the casual observer. The majority of the improvements would be located in areas designated as VRM Class IV. The proposed actions at these sites would be consistent with this VRM class. None of the improvements would require major modification of the existing character of the landscape.

The Capitol Reef Gateway SRMA would be established to manage recreation opportunities associated with Capitol Reef National Park, while protecting the values of the Fremont Gorge WSA and WSR segment. In this SRMA, there would be 2,900 acres in VRM Class I; 2,300 acres in Class II; and 7,600 acres in Classes III and IV. Facilities would be allowed to reduce resource impacts. Although the addition of facilities would introduce change into the landscape, the placement of facilities would be required to meet VRM objectives. The planned development of facilities could reduce impacts currently taking place from uncontrolled, dispersed use.

The Henry Mountains SRMA would be established under the Proposed RMP. The management of Class A scenery outside WSAs as VRM Class II would be beneficial in retaining the visual character of these areas because only low levels of changes to the landscape can occur in Class II areas.

Impacts from Travel Management

Under the Proposed RMP, less than 1% of the RFO (9,390 acres) would remain open to cross-country OHV use. Potential impacts to visual resources could occur within the open area because of a higher concentration of users in a much smaller area. Cross-country use and indications of motorized use on the landscape (including soil disturbance and loss of vegetation) would continue and likely increase on these acres. However, the total acres open to OHV use would be significantly less than under Alternative N.

Under the Proposed RMP, approximately 10% of the RFO (209,900 acres) would be closed to OHV use (primarily within WSAs), precluding scenic impacts from OHV use on those lands.

The remainder of the RFO lands (1,908,210 acres) would limit motor vehicles to designated routes. OHV use within these areas would be restricted to 4,277 miles of designated routes and would reduce the potential for additional changes to the landscape, such as soil disturbance, erosion and loss of vegetation. The number of designated route miles would be fewer than under Alternative N or A, resulting in less intermittent dust from use of these unpaved routes.

The potential impacts identified in Alternative N from cross-country access to dispersed campsites and for parking/staging would be greatly reduced under the Proposed RMP (and could occur only on the 9,390 acres open to OHV use). Vehicle access within areas limited to designated routes would be allowed on

existing spur routes to established campsites within 150 feet of the centerline of designated routes; vehicles would also be allowed to pull off designated routes up to 50 feet of each side of the centerline for parking/staging. By restricting motorized use, both of these actions would restrict potential effects to the visual landscape of those areas.

Impacts from Lands and Realty

The types of impacts experienced as a result of land tenure adjustments under the Proposed RMP would be the same as those described under Alternative A.

The types of impacts experienced as a result of issuing lands use authorizations would be similar to those described under Alternative A. However, under the Proposed RMP, impacts could occur over a smaller area because more acres would be proposed for ROW avoidance areas (601,800 acres closed to leasing or open to leasing subject to major constraints [NSO], one suitable WSR segment—5 miles, and 2 ACECs—2,530 acres).

If wind or solar energy was developed in the lands managed by the RFO, it would impact visual resources. Introducing large wind structures and solar arrays would be a noticeable change to the landscape. Under the Proposed RMP, exploration and development would be considered on a case-by-case basis. Because of the potential for a high level of change to the landscape, these developments would be consistent only with VRM Class IV objectives and would be allowed only in those areas (49% of the RFO).

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws could prevent major modification to the landscape. However, the identified withdrawals, if established, would be subject to valid existing rights, which could result in disturbance and associated impacts to visual resources in these areas. The Proposed RMP proposes a total of 176,200 acres of withdrawals.

Impacts from Minerals and Energy

Leasable Minerals

The types of impacts experienced as a result of leasable minerals decisions would be similar to those described under Alternative N.

Locatable Minerals

The types of impacts experienced as a result of locatable minerals decisions would be similar to those described under Alternative N. However, the Proposed RMP proposes more acres of mineral withdrawals (176,200 acres) than does Alternative N or A, precluding mining activities in those areas and thus allowing less disturbance to the visual landscape.

Salable Minerals

The types of impacts experienced as a result of salable minerals decisions would be similar to those described under Alternative N. However, under the Proposed RMP, more lands would be closed to disposal of salable minerals or open to salable mineral disposal with restrictions (601,800 acres would be closed to disposal of mineral materials; 1,072,000 acres would be open with restrictions to reduce ground disturbance; and 176,200 acres would be withdrawn from mineral entry). Closing or withdrawing areas from mineral operations would prevent impacts to scenery.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the suitable WSRs would help protect visual resources by preventing ground-disturbing activities in the river corridors. Under the Proposed RMP, one segment with a tentative classification of Wild (5 miles) would be managed as suitable to protect its outstandingly remarkable values, free-flowing nature, and wild classification, thus preserving the existing character of the landscape in that area. This leaves 32 miles on which ground-disturbing activities could impact the scenic landscape. Under the Proposed RMP, WSR decisions would provide less protection to visual resources than under Alternative N, C, or D but more protection than under Alternative A.

Areas of Critical Environmental Concern

The types of impacts experienced as a result of ACEC designations would be similar to those described under Alternative N, except that the Proposed RMP designates fewer areas as ACECs (two areas, totaling 2,530 acres). Scenery was not one of the relevant and important values identified for these ACECs (North Caineville Mesa and Old Woman Front). However, management actions included in ACEC management are often more restrictive, thus indirectly providing protection for visual resources. Protections associated with designation of these ACECs for the protection of the relict vegetation relevant and important values that would affect visual resources include recommending the lands for withdrawal from mineral entry, managing oil and gas leasing as open subject to major constraints (NSO), authorizing no new facilities or improvements, acquiring inholdings, closing the lands to forestry and woodland products harvesting, restricting livestock grazing, and closing the lands to OHV use. All these actions would reduce surface-disturbing activities within those areas and indirectly protect visual resources.

Alternative C

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N. However, under Alternative C, the buffer zone of lands open to leasing subject to major constraints (NSO) around springs would be 660 feet, thus protecting a larger area (34 acres, compared with 18 acres under Alternative N) from changes to the characteristic landscape.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A, although under Alternative C, fewer acres would be treated annually (averaging 26,000 annually for all treatments). In addition, this alternative proposes using only natural processes (biological and fire) to manage vegetation. These processes could be less effective than conventional vegetation treatments and would not be effective in all vegetation communities. The result could be the loss of existing vegetation cover or longer timeframes for treated areas to blend in with surrounding areas, resulting in changes in the characteristic landscape lasting for a long period. This management could also make control of some invasive species difficult because of lack of suitable substitute treatments (using fire as a control tool for species including tamarisk could increase the growth and spread of this non-native species), possibly allowing the spread of invasive species and displacement of desirable vegetation and resulting in a less natural appearance. Thus, impacts to visual resources under Alternative C would likely result in reduced short-term impacts (because fewer acres would be treated) but increased long-term impacts, compared to Alternative A.

Impacts from Cultural Resources

Impacts would be similar to those described for the Proposed RMP, except that more sites would be allocated to conservation use under Alternative C. This allocation would provide decreased public access to cultural sites and decreased public opportunities to view these resources.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative C, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 230,600 acres (11%) would be designated as VRM Class II; 509,100 acres (24%) would be designated as VRM Class III; and 941,400 acres (44%) would be designated as VRM Class IV. Alternative C designates all Class A scenery within ACECs as VRM Class II, thus protecting the scenic quality in those areas.

Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate-to-major modifications in the existing character of the landscape and could allow greater flexibility for vegetation treatments. However, less of the RFO would be designated in these VRM classes under Alternative C than under Alternative N or A or the Proposed RMP, resulting in less potential impacts to visual resources as compared to those alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for vegetation.

Impacts from Livestock Grazing

Impacts would be the same as those described under the Proposed RMP.

Impacts from Recreation

Under Alternative C, the Dirty Devil/Robbers Roost SRMA (375,800 acres) would be established to provide for recreational experiences complementary with the remote and scenic nature and other resource values, notably the ACEC values, of the area. The SRMA would be 85,300 acres larger than under the Proposed RMP, and would have more emphasis on primitive recreation opportunities. No site developments, or only the minimum required for site protection, and no onsite interpretive facilities would be proposed for this area. The VRM management objectives for this SRMA (205,200 acres in VRM Class I; 48,700 acres in VRM Class II; and 121,900 in VRM Classes III and IV) would help preserve the landscape characteristics in this area.

The Capitol Reef Gateway SRMA would be established to manage recreation opportunities associated with Capitol Reef National Park, while protecting the values of the Fremont Gorge WSA, WSR segment, and Fremont Gorge/Cockscomb ACEC. No interior site developments or onsite interpretation facilities would be allowed. Only the minimum developments required for site protection would be provided. The management objectives for this SRMA would help preserve the landscape characteristics in this area. There are 2,900 acres in VRM Class I; 2,300 acres in VRM Class II; and 7,600 acres in VRM Class III (no acres in Class IV).

Under Alternative C, the Henry Mountains SRMA would be established and managed in concert with the Henry Mountains ACEC. The management of Class A scenery as VRM Class II would be beneficial in retaining the visual character of these areas.

Sevier Canyon SRMA would be managed to protect the scenic values in and around the Sevier Canyon. Management of this SRMA in concert with the Sevier Canyon ACEC would help preserve the landscape characteristics in this area.

Impacts from Travel Management

Under Alternative C, no acres would be open to cross-country OHV use, thus protecting the visual resources throughout the RFO from potential impacts caused by cross-country motorized use (soil disturbance and loss of vegetation). Thirty-two percent of the RFO (683,000 acres) would be closed to OHVs under this alternative, precluding scenic impacts from OHV use on those lands.

Areas not designated as closed to OHV use would be limited to designated routes, thus protecting visual resources on the 1,445,000 acres within the limited category (no areas would be open to OHV use under this alternative). OHV use within these areas would be restricted to 3,192 miles of designated routes and would reduce the potential for additional changes to the landscape, such as soil disturbance, erosion, and loss of vegetation. The number of designated route miles would be less than under Alternative N or A or the Proposed RMP but more than Alternative D.

Impacts from Lands and Realty

The types of impacts experienced as a result of land tenure adjustments under Alternative C would be similar to those described under Alternative A, except that less land would be available for disposal under Alternative C. This alternative identifies no lands for FLPMA land sales; lands could be disposed of by other means (such as exchange) if the land tenure adjustment met the goals and objectives of Alternative C, such as resulting in a net increase of sensitive resources.

The types of impacts experienced as a result of issuing lands use authorizations would be similar to those described under Alternative A. However, under Alternative C, impacts could occur over a smaller area because more acres are proposed as ROW avoidance areas (735,000 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments—135 miles, and 16 ACECs—886,810 acres).

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws could prevent major modification to the landscape. However, the identified withdrawals, if established, would be subject to valid existing rights, which could result in disturbance and associated impacts to visual resources in these areas. Alternative C proposes a total of 331,100 acres of withdrawals.

Wind or solar energy development would be considered on all RFO lands that are designated as VRM Class IV (the only class that allows major modifications to the landscape). This designation would give some protection to the landscape character in VRM Class I, II, and III areas. This kind of development would still be noticeable in VRM Class IV lands, but would be consistent with the VRM objectives for that class.

Impacts from Minerals and Energy

Leasable Minerals

The types of impacts experienced as a result of leasable minerals decisions would be similar to those described under Alternative N.

Locatable Minerals

The types of impacts experienced as a result of locatable minerals decisions would be similar to those described under Alternative N. However, Alternative C proposes more acres of mineral withdrawals

(331,100 acres) than does Alternative N or A or the Proposed RMP, thus precluding mining activities in those areas and allowing less modification to the landscape.

Salable Minerals

The types of impacts experienced as a result of salable minerals decisions would be similar to those described under Alternative N. However, under Alternative C, more lands would be closed to disposal of salable minerals or open to salable mineral disposal with restrictions (586,300 acres would be closed to disposal of mineral materials; 1,049,800 acres would be open with restrictions to reduce ground disturbance; and 331,100 acres would be withdrawn from mineral entry). Closing or withdrawing areas from mineral operations would prevent impacts to scenery by allowing less modification to the landscape.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Protecting the outstandingly remarkable values of the eligible WSRs would help protect visual resources by preventing ground-disturbing activities in the river corridors. Under Alternative C, all eligible segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. This management would preserve the existing character of the landscape in these areas.

Areas of Critical Environmental Concern

Alternative C designates 16 ACECs (886,810 acres); scenery was specifically identified as a relevant and important value in 7 of these (Badlands, Dirty Devil, Fremont Gorge/Cockscomb, Henry Mountains, Horseshoe Canyon, Little Rockies, and Lower Muddy Creek). To protect the visual resources in these ACECs, the Class A scenery would be designated as VRM Class II. Vegetation management was identified as a management prescription in the Henry Mountains ACEC, to provide improved habitat for bison and mule deer, both identified as relevant and important values. Allowing no uses (in all ACECs except for the Henry Mountains) that would cause irreparable damage to the relevant and important values would reduce surface-disturbing activities within those areas, protecting vegetation and improving ecological condition of riparian areas. Possible disallowances include closing the areas to OHV use; managing the areas as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; designating the areas as VRM Class II; making the areas unavailable for livestock grazing as appropriate to protect relict vegetation and ecological values, or fencing riparian areas in ACECs where grazing occurs; and acquiring inholdings. However, opportunities for vegetation treatments could be limited, which could inhibit or prevent attainment of ecological objectives and desired conditions in these areas.

Alternative D

Impacts from Air Quality, Soil Resources, and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N, although under Alternative D, these impacts would occur over a much smaller area because of differences in VRM class designations between the two alternatives. Under Alternative D, 1,129,600 acres (53% of the lands managed by the RFO) would be designated as VRM Class I; 66,700 acres (3%) would be designated as VRM Class II; 355,100 acres (17%) would be designated as VRM Class III; and 576,600 acres (27%) would be designated as VRM Class IV. Just more than half of the RFO would be designated as VRM Class I or II, meaning that the existing character of the landscape must be preserved or retained. Thus, surface-disturbing activities would generally not be allowed in these areas, resulting in retention of the characteristic landscape. Therefore, Alternative D would result in less impacts to scenery than would Alternative N, A, or C or the Proposed RMP.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres in 29 areas would be managed to protect their wilderness characteristics (size, naturalness, opportunities for solitude, and opportunities for primitive forms of recreation). These lands would be designated as VRM Class I to preserve the characteristic landscape. These areas would be closed to surface-disturbing activities, thus preventing changes to the characteristic landscape (vegetation, landform, and water) and protecting the scenic quality of these lands.

Impacts from Livestock Grazing

Impacts would be the same as those described under the Proposed RMP.

Impacts from Recreation

Impacts would be similar to those described under Alternative C, with the exception that three additional SRMAs (with a combined acreage of 266,400 acres) would be established: Labyrinth Canyon, Little Rockies, and San Rafael Swell. These SRMAs would be established to provide for recreational experiences complementary with the remote and scenic nature and other resource values of the area. No site developments, or only the minimum required for site protection, and no onsite interpretive facilities would be proposed for this area. The management objectives for this SRMA would help preserve the landscape characteristics in this area.

Impacts from Travel Management

Under Alternative D, no acres would be open to cross-country OHV use, so the visual resources throughout the RFO would be protected from potential impacts from cross-country motorized use (including soil disturbance and loss of vegetation). Under Alternative D, 1,155,200 acres (54% of the RFO) would be closed to OHVs, precluding scenic impacts from OHV use on those lands. This alternative would designate the most area as closed to OHV use, thus providing the most protection to visual resources.

The remainder of the RFO (972,800 acres) would limit motorized travel to designated routes. OHV use within these areas would be restricted to 3,043 miles of designated routes, thus reducing the potential for additional landscape changes such as soil disturbance, erosion, and loss of vegetation. The number of designated route miles would be least under Alternative D of all the alternatives.

Impacts from Lands and Realty

Under Alternative D, 903,900 acres (42% of the RFO) would be recommended for withdrawal from mineral entry including:

- Rainbow Hills ACEC, Old Woman Front ACEC, and portions of the remaining ACEC
- All 12 eligible WSR segments
- All non-WSA lands with wilderness characteristics.

Withdrawing lands from all forms of entry, location, selection, sale, or leasing under the public land laws could prevent major modification to the landscape. However, the identified withdrawals, if established, would be subject to valid existing rights, which could result in disturbance and associated impacts to visual resources in these areas. Scenic values would be best protected under Alternative D because the most acreage would be withdrawn from future entry, location, selection, sale, or leasing.

Wind or solar energy development would be considered on all RFO lands that are designated as VRM Class IV (the only class that allows major modifications to the landscape). This would give some protection to the landscape character in VRM Class I, II, and III areas. The introduction of this kind of development would still be noticeable in VRM Class IV lands, but would be consistent with the VRM objectives for that class.

Potential impacts that lands and realty decisions could have on visual resources would be the least under Alternative D.

Impacts from Minerals and Energy

Leasable Minerals

The types of impacts experienced as a result of leasable minerals decisions would be similar to those described under Alternative N. However, under Alternative D, impacts would occur over a much smaller area because more areas would be closed to leasing or open to leasing subject to major constraints (NSO) (1,203,800 acres). Designating areas as closed to leasing would prevent changes to the characteristic landscape (vegetation, landform, and water) and protect the scenic quality of these lands. Impacts to visual resources from leasable minerals activities would be much less under Alternative D, compared to all the other alternatives.

Locatable Minerals

The types of impacts experienced as a result of locatable minerals decisions would be similar to those described under Alternative N. However, Alternative D proposes substantially more acres of mineral withdrawals (903,900 acres), compared to Alternatives N, A, or C or the Proposed RMP, thus precluding mining activities in those areas and allowing less modification to the landscape.

Salable Minerals

The types of impacts experienced as a result of salable minerals decisions would be similar to those described under Alternative N. However, under Alternative D, more lands would be closed to disposal of salable minerals or open to salable mineral disposal with restrictions (1,160,500 acres would be closed to disposal of mineral materials; 290,200 acres would be open with restrictions to reduce ground disturbance; and 903,900 acres would be withdrawn from mineral entry). Closing or withdrawing areas from mineral operations would prevent impacts to scenery.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative C, except that under Alternative D, additional restrictions would be applied to non-WSA lands with wilderness characteristic areas that are within ACECs. These restrictions could include designating Class A scenery as VRM Class I, not allowing fences or surface-disturbing activities, closing these areas to leasing, closing the areas to OHV use, or recommending the areas for withdrawal from mineral entry. All these actions would preclude surface-disturbing activities in those areas, thus allowing minimal modification to the landscape.

4.3.8 Special Status Species

This analysis focuses on impacts to SSS as a result of management actions that affect species or their populations and changes to the condition of their habitats. SSS include federally listed species, federal proposed and candidate species, and BLM sensitive species. Although some data on known locations and habitats within the RFO are available, the data are neither complete nor comprehensive of all SSS known to occur or potential habitat that might exist. Known and potential SSS and habitat locations were considered in the analysis; however, the potential for species to occur outside these areas was also considered and, as a result, some impacts are discussed in more general terms. Impacts to other fish and wildlife species and their habitats are addressed in Fish and Wildlife.

To preserve SSS, various laws, regulations, and policies require that SSS be considered in any agency decision that could affect threatened and endangered and sensitive species. Consideration usually includes inventory, evaluation, and mitigation of effects. Addressing effects to these species includes either project relocation or redesign (avoidance) or site-specific mitigation.

Although information on locations of all SSS sites in the RFO is incomplete, the analysis considers the management alternatives and their potential to directly or indirectly affect SSS resources, as noted previously. The number of species that could be affected by various actions is directly correlated with the degree, nature, and quantity of surface-disturbing activities in the RFO. Impacts are quantified when possible. In the absence of quantitative data, best professional judgment was used. Some of the decisions in this document are programmatic; others (e.g., route designation, oil and gas leasing categories) may be implemented immediately. To ensure preservation of specific species, further analyses will be required at the implementation level, following site-specific species inventories.

Impacts that other management programs in the planning area could cause to SSS include loss or alteration of native habitats, increased invasion of noxious weeds and other exotic weed species, decreased water availability, increased habitat fragmentation, changes in habitat and species composition, disruption of species behavior (leading to reduced reproductive fitness or increased susceptibility to predation), and direct mortality of individuals. Surface-disturbing actions that alter vegetation characteristics (e.g. structure, composition, or production) have the potential to affect habitat suitability for special status plants or animals, particularly when the disturbance removes or reduces cover or food resources. Even minor changes to vegetation communities have the potential to affect SSS.

Direct impacts from management activities to SSS may result in mortality or displacement of individuals, disturbance caused by reduced air or water quality, and alteration of immediate environments through loss of or changes to key habitat components. Beneficial or adverse effects are possible. Key habitat components include food availability or quality, cover from predators, thermal refugia, nesting/roosting/denning habitat, water availability and quality, and travel corridors. Direct impacts may affect individuals, populations, or habitats for the duration of the action, for a few days thereafter, or for several growing seasons, or may continue indefinitely if the action results in permanent habitat loss.

Indirect impacts from management activities to SSS typically result from influences of post-disturbance succession, recovery, or rehabilitation of the habitat. Beneficial or adverse effects are possible. These impacts may be long term, depending on the severity of the habitat alteration, and may change species assemblages (relative abundances or species composition), species behaviors, or overall population trends, benefiting some species and adversely affecting others.

Methods and Assumptions

To analyze the potential effects of the alternatives on SSS, information was gathered from existing inventories, recovery plans, conservation agreements, Utah Natural Heritage Program database, relevant scientific literature, computer habitat models, and other sources identifying the potential distribution of these species in and adjacent to the planning area. The analysis is also based on professional expertise of BLM specialists at the RFO, Utah State Office, knowledge of the area, and a review of the relevant scientific literature.

To comply with Section 7 of the Endangered Species Act (ESA), a Biological Assessment (BA) will be prepared to address impacts and mitigating measures on threatened, endangered, and candidate species, as well as designated critical habitat. In determining impacts for this Proposed RMP, BLM staff considered how the action would affect listed or candidate species known or suspected to occur in an area. Impacts were measured against information about threats found in the *Federal Register* (FR) notice describing the listing of the species and the potential for the action to modify designated or proposed critical habitat. Direct and indirect impacts were considered together with impacts of activities that are interrelated or interdependent. Impacts were quantified when possible. In absence of quantitative data, best professional judgment was used. In the following discussion, impacts are sometimes described by using ranges of potential impacts or in qualitative terms, if appropriate.

This analysis was based on the following assumptions:

- SSS habitat would be managed for the benefit of those species as a priority over other resource allocations and uses.
- Ground-disturbing activities could lead to modification of habitat or loss or gain of individuals, depending on the amount of area disturbed, the species affected, and the location of the disturbance.
- All surface-disturbing activities would include mitigation to reduce impacts to SSS and their habitat. Conservation measures developed for each listed or proposed species (Appendix 14) would be applied to any proposed project within the habitat of that species. Analysis of impacts and determinations of effects would include any and all mitigation and conservation measures.
- Prior to any surface-disturbing activity, an SSS review would occur to determine whether any such species would be present in the project area.
- United States Fish and Wildlife Service (USFWS) would be consulted for any actions that could have a potential to affect federally listed species.

Environmental Consequences

Impacts to SSS would likely result from actions proposed under the following resource management programs:

- Soil Resources
- Water Resources
- Vegetation
- Cultural Resources
- Paleontological Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Wild Horses and Burros

- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on SSS.

Alternative N: No Action

Impacts from Soil Resources

Activities conducted under the soil management program are limited to monitoring, implementing support activities, providing information for other BLM programs, and recommending appropriate mitigation. Typical activities implemented under the soil resource program would include mapping soils, maintaining soil databases, identifying timing stipulations, and recommending protective measures for critical soils. For example, implementation of timing stipulations would reduce surface disturbance in areas that have a high seasonal erosion potential. As a result, SSS would benefit from a decrease in erosion and sedimentation, thereby generally maintaining or improving habitat.

Many special status plant species such as Last Chance townsendia (*Townsendia aprica*) and Wright fishhook cactus (*Sclerocactus wrightiae*) are located in drainages or runoff areas within the Mancos Shale formation. The soils in these areas are naturally erosive and have a high salt content. Increased erosion and sedimentation has been shown to cause the direct mortality of both plant species (personal observation, Megan Robinson). The management of soil would help reduce the amount of erosion and sedimentation within SSS habitat.

Impacts from Water Resources

Implementation of water quality- and quantity-related actions would guide or advise other program actions and activities in a manner conducive to maintaining or improving surface water quality. This implementation would be consistent with existing and anticipated uses and applicable state and federal water quality standards. Beneficial impacts to SSS include improved habitat for fish and wildlife and their associated prey. Maintaining or improving habitat associated with aquatic systems would provide long-term benefits for bald eagle (*Haliaeetus leucocephalus*), Southwestern willow flycatcher (*Empidonax traillii extimus*), Northern goshawk (*Accipiter gentilis*), and Western yellow-billed cuckoo (*Coccyzus americanus*) habitat and populations. No management actions under any of the alternatives would adversely affect the federally listed Colorado River fish or their habitat in the planning area or in downstream reaches. Long-term reductions in water quality, water quantity, flow, or changes in water temperatures are not anticipated.

Impacts from Vegetation

Management Activities in Riparian and Wetland Areas

The purpose of the riparian and wetland management program is to maintain, restore, or improve riparian habitats. Proposed management actions that would be implemented to protect riparian areas include restrictions on time, space, and placement, as well as the establishment of 500-foot buffer zones around riparian areas. No surface-disturbing activities would be allowed around the outer edge of springs unless

it could be shown that there would be no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This restriction would protect any SSS and habitat within the buffer zone from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian-area restoration and vegetation treatment.

Vegetation treatments and streambank stabilization projects would potentially result in short-term adverse impacts to SSS whose habitat is located primarily in riparian and wetland areas (e.g., Southwestern willow flycatcher, bald eagle, yellow-billed cuckoo). Streambank stabilization and habitat restoration projects could result in the removal of riparian vegetation in these areas. Many of these areas are potential habitat for riparian obligate SSS. Impacts to SSS from these activities could include temporary disturbance or loss of occupied or potential habitat from heavy equipment use, increased human presence, and associated noise. Vegetation treatments in riparian areas could include the use of herbicides, fire, or mechanical removal of exotic plant species such as tamarisk or Russian olive. Application of herbicides has a remote potential for accidental drift into SSS habitat.

In the long-term, vegetation treatments and streambank recontouring would likely benefit riparian obligate SSS by improving or enhancing riparian habitat. Additionally, beneficial impacts to upland SSS could result from maintaining or improving natural hydrologic watershed processes. Activities to maintain or improve riparian health would have beneficial impacts on riparian-obligate SSS. Such activities could include construction of livestock, wildlife, and recreation exclosures within riparian habitats or habitat rehabilitation projects.

As stated, management of riparian and wetland areas would include the avoidance of surface-disturbing activities within 500 feet of riparian areas. This restriction would likely benefit riparian-obligate SSS. For example:

1. The Southwestern willow flycatcher, bald eagle, and yellow-billed cuckoo are riparian obligate species. Any restrictions on surface disturbance in the riparian habitat of these species would reduce adverse impacts. Southwestern willow flycatchers and yellow-billed cuckoos have both been known to nest in exotic riparian plant species such as tamarisk and Russian olive. The restriction of riparian projects such as mechanical removal of exotic species could protect nesting Southwestern willow flycatchers or yellow-billed cuckoos from nest abandonment and destruction.

2. Restrictions and buffers zones would reduce human activity within Southwestern willow flycatcher, bald eagle, and yellow-billed cuckoo habitat. Human activity and noise in areas occupied by Southwestern willow flycatchers, bald eagles, and yellow-billed cuckoos could alter nesting or foraging behavior. Reducing or eliminating human interaction by implementing restrictions and buffer zones would reduce the likelihood of altering these behaviors and could help increase nesting success rates. Federally listed Colorado River fish species located downstream from the planning area would not be adversely affected by any actions related to riparian and wetland management. The restrictions and buffer zones would maintain or improve the current character of the major streams, such as the Dirty Devil River, that flow into listed Colorado River fish habitat.

All riparian areas would be managed in accordance with BLM Utah riparian policy. It is the objective of this riparian policy to improve or maintain riparian areas in proper functioning condition. Riparian areas are classified as in “proper functioning condition” when there is adequate vegetation and landform structure present to dissipate stream energy from high flows. This condition reduces erosion, improves water quality, filtrates sediment, captures bedload, and aids floodplain development. Properly functioning riparian areas also result in an improvement in flood water retention and groundwater recharge,

development of root masses that stabilize streambanks against cutting action, development of diverse ponding and channel characteristics necessary for fish production and other uses, and greater biodiversity support. Continuing to implement this policy would minimize impacts on SSS inhabiting riparian and wetland areas.

Riparian and Wetland Inventories

Inventories within riparian and wetland areas would result in a better understanding of the extent of SSS and their habitats. This information would assist in the management of these areas. For example, inventory and monitoring activities could lead to habitat improvement actions such as construction of livestock, wildlife, and recreation exclosures within riparian habitats, or habitat rehabilitation projects. Wetland-obligate SSS are likely to benefit in the long term from maintained or improved riparian habitats.

Adverse short-term impacts that could result from riparian and wetland inventories could include the trampling of SSS plants and associated habitats, and increased human activity within special status wildlife species habitat.

Human presence and noise associated with exclosure development and maintenance within special status bird species habitat (such as habitat of the Southwestern willow flycatcher, bald eagle, and yellow-billed cuckoo) could disturb foraging behavior and cause nests to be abandoned, if the action inadvertently occurred during the species' nesting season.

Overall Vegetation Management

Vegetation management activities include fencing, weed treatment, timber harvest, sagebrush management (spraying, mechanical treatment, or burning), and seeding of disturbed areas or weed-treated areas. Vegetation management activities, especially those that use heavy equipment, would result in short-term adverse impacts to special status plant species and their habitat. Surface-disturbing activities could result in the crushing and mortality of individual plants and alteration of their habitat because of soil erosion or sedimentation.

Potential short-term impacts to Utah prairie dogs (*Cynomys parvidens*) include direct mortality of individuals from accidental chemical treatment drift, increased human presence, and damage to burrows. Heavy equipment used for reseeding or mechanical removal of undesirable vegetation could inadvertently damage burrows. Increased human presence could alter Utah prairie dog behavior, reducing the amount of time available for the species to forage, and could cause unnecessary energy expenditures in fleeing and alerting behavior. The presence of biologists during these activities would reduce the potential for burrow disturbance by monitoring and overseeing treatment operations. The removal of sagebrush from around prairie dog colonies would benefit the prairie dogs by allowing for growth of herbaceous vegetation used for foraging and by removing predator cover.

Human disturbance and noise associated with the use of heavy equipment could temporarily disperse special status bird species from occupied habitats. Adverse impacts to special status bird species could also result from accidental chemical drift from pesticide use in nearby areas, which could poison individuals or result in mortality of prey species. Prescribed burning could also disturb nesting special status bird species. These impacts would be expected to be localized and short term.

In the long term, SSS would benefit from most vegetation treatments because of an increase in vegetation productivity, which would provide additional forage, cover, and prey base.

Vegetation Treatments

Vegetation treatment methods include mechanical, prescribed fire, and chemical treatments. Surface disturbing activities, such as the use of heavy equipment, could cause crushing and mortality of individual plants and could alter habitat. The use of herbicides or pesticides in occupied habitat could render the habitat unsuitable for use by some species. Chemical weed controls could also affect potential pollinators of special status plant species, by eliminating their habitat.

Using heavy equipment to remove vegetation could temporarily reduce potential breeding and nesting habitats. Human disturbance and noise associated with the use of heavy equipment could also temporarily displace special status bird species from foraging and nesting habitats. For example, the Southwestern willow flycatcher and the yellow-billed cuckoo have been known to nest in tamarisk and Russian olive. Vegetation treatments to remove these invasive plant species could result in habitat loss and could disrupt nesting and foraging behavior.

The use of pesticides could result in a short-term reduction in herbivorous insects, which could cause changes to surrounding vegetation. If insect populations were substantially reduced over a long period, insectivorous SSS could disperse from currently occupied areas in an effort to find a larger forage base.

Chemical treatments and prescribed burning could also disturb nesting special status bird species because of smoke or chemical spray inadvertently drifting into occupied habitat. These activities have the potential to remove suitable habitat or other desirable vegetation.

In the long term, SSS would benefit from most vegetation treatments through an increase in vegetation productivity, which would provide additional forage, cover, and prey base.

Management of Noxious Weeds and Invasive Species

Noxious and invasive weed management activities include herbicide use, biological controls, and mechanical treatments in weed infested areas. Actions conducted in areas near SSS habitat could benefit these species by removing species that would compete with native species for available space and resources. When a specific project has been selected in SSS habitat, the necessary Section 7 consultation with USFWS would occur. Adverse impacts could result from mechanical vegetation treatments requiring the use of heavy equipment, resulting in the crushing and mortality of individual special status plant and animal species, as previously discussed. Short-term habitat and forage loss for some SSS could also result. Adverse direct impacts could result from accidental chemical drift caused by herbicide use in nearby areas.

Insect Pest Management

SSS could benefit from treatments that target destructive insects such as grasshoppers, cutworms, and Mormon crickets. Actions taken to remove destructive insects would reduce potential competition for available forage. However, many special status plant species' pollination vectors are not clearly understood. The elimination of potential pollinators could contribute to low fruit and seed set within the plant populations.

Control of insects in localized areas would likely result in adverse impacts to SSS in those areas. The reduction of some specific insect populations within special status bird habitats could alter foraging and nesting behavior by reducing the prey base and by requiring the birds to travel further to forage. For example, grasshoppers are a food source for Southwestern willow flycatcher, burrowing owl, yellow-billed cuckoo, and Greater sage-grouse. The short-term reduction in herbivorous insects could also result in changes to surrounding vegetation. If insect populations were substantially reduced over a long period,

special status bird species could disperse from currently occupied areas in an effort to find a larger forage base.

Adverse impacts could also result from accidental chemical drift of pesticides used in nearby areas. Ingestion of pesticides could lead to direct mortality of individual Utah prairie dogs or could cause decreased pup survival. However, continued dusting to control plague would help stabilize prairie dog populations and reduce the potential for catastrophic loss in individual colonies.

Impacts from Cultural Resources

Cultural resource actions could occur within occupied or potential habitat of SSS. Such actions could include developing interpretive sites, identifying cultural resources, using hand and power tools, establishing temporary camping areas, building fences, and stabilizing deteriorating buildings. Human activities in special status bird species habitats could disrupt nesting and foraging behaviors and cause the species to leave the area or abandon nests. Interpretive sites placed near nests or within home ranges of bird pairs could disturb nesting behavior on a long-term basis. This activity could lead to individual nest failure and reduced reproductive success.

The development of interpretive sites located within SSS habitat could also increase human activity in an area, resulting in the crushing and trampling of individual plants and habitat degradation over the long term. Cultural resource program actions involving excavation efforts could cause localized population declines because of crushing and destruction of individual plants, increased sedimentation, and soil compaction.

If a cultural resource project is conducted within SSS habitat, the described actions could adversely affect special status animal species, such as Utah prairie dogs and Greater sage-grouse, through the trampling of burrows and habitat degradation. These actions could result in surface disturbance, increased human presence, and noise that would disturb or displace special status animal species. Additionally, excavation activities within occupied habitat could cause direct mortality to the species. Human activities could disrupt foraging behaviors and could cause species to abandon habitat. Interpretive sites located within or near occupied habitat could disturb species' natural behavior on a long-term basis because of increased human presence.

The identification of new areas for field inventories could adversely impact SSS, depending on the intensity of the survey. If field inventories were to include SSS habitat, adverse impacts could be expected. Special status plant species populations and habitat could be trampled by surveyors searching for cultural artifacts and sites to survey. Human activities in special status bird species habitats could disrupt nesting and foraging behaviors and could result in the species leaving the area or abandoning nests. Ground-dwelling species such as the Utah prairie dog and Greater sage-grouse could experience trampling of burrows and habitat degradation within the survey areas. These actions also could result in increased erosion, noise, and visual stimulants for the species. Human activities could disrupt foraging behaviors and could result in the abandonment of the areas. Implementation of Alternative N would not directly affect SSS because no priority areas for new field inventories would be identified within the RFO.

Impacts from Paleontological Resources

Paleontological resource actions could include developing interpretive sites, identifying paleontological sites, using hand and power tools, establishing temporary camping areas, and building fences. These developments could occur within occupied or potential habitat of SSS. Actions including the development of interpretive sites, identification of paleontological resources, and the use of hand and power tools for excavation activities would increase noise and visual stimulants. These actions could temporarily disturb or displace birds. In addition, nests or key habitat components could be damaged or destroyed by the

removal of vegetation through actual digging activity or by the fencing of paleontological sites. Temporary camping areas could be established in habitats used by special status bird species. Human activities associated with paleontological activities in bird habitats could disrupt nesting and foraging behaviors and could result in the species leaving the area or abandoning nests.

If conducted within special status plant species habitat, paleontological resource activities could cause localized population declines. The necessity to conduct excavations and related activities within SSS plant habitat is expected to be rare.

Based on existing information, there would be little overlap between paleontological resources and Utah prairie dog habitats. However, should an excavation be required in prairie dog habitat, the dogs would be displaced from the disturbed areas. The use of heavy equipment within occupied habitat could destroy occupied burrows. Human activities in viable habitats could disrupt foraging behaviors and could result in the species abandoning occupied habitat. Increased human activity at interpretive sites within or near occupied habitat could disturb the prairie dog's natural behavior.

Impacts from Visual Resources

In general, VRM class designations would limit or allow surface-disturbing activities in certain areas, thereby affecting SSS. VRM Classes I and II, which preserve or retain the existing character of the landscape, would protect SSS by restricting ground-disturbing activities. VRM Classes III and IV would provide less protection by allowing more changes to the landscape and by being less restrictive of ground-disturbing activities. Under Alternative N, none of the lands managed by the RFO would be classified as VRM Class I; 529,500 acres (25%) would be managed as VRM Class II; 569,000 acres (27%) would be managed as VRM Class III; and 1,029,500 acres (48%) would be managed as VRM Class IV. Managing areas as VRM Class II would reduce surface disturbance and retain existing vegetation, thereby protecting SSS. Areas managed as VRM Class III or IV (75% of the RFO under this alternative) would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the habitat for SSS.

Impacts from Special Status Species

Implementation of the SSS program is designed to manage threatened, endangered, candidate, and sensitive species and their habitat. Activities could include conducting surveys, implementing habitat-improvement projects, and closing areas that contain populations or suitable habitat for SSS to OHV use or other surface-disturbing activities. Other actions would include inventory, monitoring, and population dynamics studies. BLM would continue to participate in the development of Recovery Plans and Conservation Agreements. Management activities conducted under the program that would benefit SSS include the provision of guidance, monitoring, and conservation measures.

Impacts from Fish and Wildlife

The primary threat to SSS as a result of implementing actions that are associated with the wildlife management program would be habitat manipulation that could cause surface disturbances in potential or occupied habitat. Habitat manipulations such as prescribed burns, and chemical or biological controls are typically used to improve habitat for wildlife. The continued maintenance or improvement of wildlife habitats in the vicinity of listed SSS could hold some long-term benefits for the species. However, there could be short-term adverse impacts such as loss or fragmentation of habitat, loss of individuals because of redistribution of grazing herbivores, or temporary sedimentation or changes in natural water regimes because of hydrologic changes. An increase in sedimentation could be particularly harmful to plant species that are located in drainages or wetland areas. However, these potential impacts would be

localized and would not affect endangered Colorado River fish habitat downstream from the planning area.

Restrictions or stipulations of surface-disturbing activities within wildlife habitats that overlap with SSS habitat could benefit SSS within the restricted areas. The restrictions would reduce adverse effects incurred by surface disturbances that could harm SSS. Under Alternative N, areas in which current surface-disturbance restrictions are in place (such as WSAs and eligible WSR corridors) could benefit SSS within these areas. In areas in which there are no surface-disturbance restrictions, impacts (such as decreased air quality, erosion, soil compaction, introduction of exotic and noxious weeds, crushing of plants, and habitat modification) could cause incidental take of the species.

SSS such as the Mexican spotted owl, bald eagle, and Cronquist wild buckwheat (*Eriogonum corymbosum* var. *cronquistii*) are known to exist within the Henry Mountains area. Alternative N would restrict oil and gas exploration and leasing activities in crucial bison habitats and in crucial and high-value mule deer habitats during the winter and spring, minimizing disturbance to these SSS. Soils are often wet during the winter and spring, so lack of activity would minimize the potential for soil compaction and would reduce detrimental impacts to wild buckwheat. Restricting activities in winter and spring would also reduce disturbance to wintering bald eagles and breeding Mexican spotted owls.

Implementation of this alternative would provide no seasonal or spatial restrictions on surface-disturbing activities in desert bighorn habitat but would require compliance with the *Desert Bighorn Sheep Management Plan* which includes the following goals: 1) Establish optimum populations of bighorn sheep in all suitable habitat within the state, 2) provide good quality habitat for healthy populations of bighorn sheep, and 3) provide high quality opportunities for hunting and viewing of bighorn sheep. However, this management plan lacks specific direction on actions to protect bighorn sheep and their habitat from surface-disturbing activities (such as oil and gas development), so potential adverse impacts could be substantial.

Impacts from Wild Horses and Burros

Alternative N would allocate 100 AUMs for wild burros in the Canyonlands HMA. This HMA is located near Mexican spotted owl designated critical habitat. Therefore, authorized wild burro activities could impact occupied Mexican spotted owl habitat during the life of the Proposed RMP. The presence of wild burros and subsequent gathering-related actions could adversely affect the Mexican spotted owl through noise, construction of temporary gathering structures, and the trampling of habitat used by the owl. Herd gathers generally would be conducted after July 1, minimizing harmful effects to nesting spotted owls. Herd gathering would be conducted using hazing techniques of low flying helicopters, vehicles, and gathering pens. Wild burros could run through occupied spotted owl habitat. These activities could disrupt owl foraging behaviors.

Impacts from Fire and Fuels Management

The focus of this analysis is on fire management activities including wildfire suppression, prescribed fire, and non-fire fuel treatments, and not on the impacts of wildfire itself. Actions associated with fire management could adversely affect SSS and their habitat.

Increased human activity and noise associated with wildland fire suppression and prescribed fire in areas occupied by special status bird species would affect nesting, foraging, or roosting behavior. Foraging, nesting, and communal winter roosting habitats could be lost because of the use of heavy equipment, hand tools, and noise associated with intensive human activity. Some snags used for perching, roosting, or nesting could be lost because of suppression operations. However, these snags could be replaced as new snags result from fire mortality. The effects from wildland fire suppression could potentially become long term, depending upon the severity and extent of the activities conducted during a particular fire

suppression operation. A large fire that would require extensive suppression operations, such as extensive staging areas and fire-line construction, could result in long-term adverse effects to special status bird species and their habitats. However, smaller fires that would require less-extensive suppression operations would generally avoid these long-term, adverse effects.

Fire suppression activities could adversely affect special status animal species such as the Utah prairie dog and Greater sage-grouse and could cause immediate post-fire alteration or damage of occupied or suitable habitats. Suppression operations could result in harassment, displacement, injury, or mortality during staging, fire line construction, backburning, noise, or other human-caused disturbance. Any direct adverse effects would generally be short term, ending when or shortly after suppression actions were concluded. However, surface-disturbing operations conducted during fire suppression would result in a reduction or loss in quantity and quality of cover and forage habitat in both the grassland and sagebrush habitats. These activities would reduce forage availability, damage or destroy burrows or colonies, and remove the sagebrush and shrubs that provide above-ground vegetation cover. Despite the immediate initial loss of forage and shrub cover, some suppression tactics (e.g., backburning operations), or emergency restoration actions would stimulate vigorous regrowth of forb species in the following growing seasons. This regrowth would benefit SSS through improved forage quality and quantity.

A large fire event and associated suppression activities could result in the deposition of large amounts of sediment and ash into local river systems. Federally listed Colorado River fish habitat located downstream from the planning area could experience short-term water quality degradation. However, no long-term adverse impacts to the river system or the fish would be anticipated. Any fire retardant inadvertently deposited into the river system would likely dissipate and would not affect any listed fish species. Because prescribed fire-related actions tend to be limited in scope and smaller than major wildfires, no downstream adverse impacts to the listed Colorado River fish would be expected.

Fire management activities could adversely affect special status plant species by trampling individuals or habitat. Fire suppression activities also have the potential for resulting in increased erosion. The fire itself could result in the death of individual plants or the alteration of their habitat. The construction of fire lines by using hand tools and heavy machinery could also result in the destruction of individual plants and could alter habitat. Many special status plant species are found in locations in which wildfire did not historically burn. However, the presence of invasive weeds in those areas could result in fires burning where they previously did not. Therefore, the potential of a wildland fire, with attendant suppression activities, in special status plant species habitat is increasing.

Prescribed fire management activities, including fire-line construction and use of staging areas, could adversely affect listed special status plant species by trampling individual plants or altering habitat, as previously described. However, the severity of this impact would be much less than described under Appropriate Management Response because prescribed burns generally would not be proposed within special status plant species habitat.

Under Alternative N, prescribed fires would be used to reduce hazardous fuels within the RFO. As stated above, prescribed fires would have the potential to adversely affect SSS. However, habitat manipulations resulting from the use of fire would also benefit SSS over the long term by improving vegetative conditions.

Stabilization and rehabilitation efforts would benefit SSS over the long term by decreasing erosion and restoring or improving habitat conditions following a fire event, although there could be short-term adverse impacts. The planting of non-native species that could out-compete special status plant species and other native plant species used by special status wildlife species would alter habitat conditions and would make them less favorable. The use of heavy equipment within special status plant species habitat

could result in the crushing of individual plants and segmentation of populations. Increased human activity during construction efforts could cause special status bird species to alter foraging, nesting, and roosting behaviors. The use of heavy equipment associated with stabilization efforts within Utah prairie dog colonies could result in the crushing of burrows and the direct mortality of individual prairie dogs.

Alternative N includes stabilization efforts as needed for every wildland fire. Stabilization efforts have the potential to benefit SSS through decreased erosion and improved habitat and vegetative conditions. However, as described previously, surface-disturbing activities associated with stabilization also have the potential to adversely affect SSS by altering habitat, primarily on a short-term basis.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for SSS.

Impacts from Forestry and Woodland Products

Forest and Woodland Products Harvesting

Forestry and woodland management actions include the harvesting of firewood, poles, Christmas trees, pine nuts, timber, and seed collection. Commercial forestry activities (e.g., timber harvests and sales) are restricted to upland forests. These activities could include the use of heavy equipment, helicopters, chemical applications, road construction, and culvert installation, and typically would result in increased traffic, noise, and human presence.

The implementation of forestry management actions that reduce pinyon-juniper woodland invasion would benefit those SSS that require open space. The clearing of old, dense, relatively less-productive woodlands could open up more productive areas that could be used by SSS.

Potential adverse impacts to special status bird species could include loss of habitat, increased human access to remote habitats because of new road construction, increased noise, increased human activity, overspray or drift of chemical treatments, and culvert installation or waterbar construction, all of which could alter riparian function. These activities could result in habitat loss or fragmentation, displacement of individuals, reduction in special status bird species prey base, or direct mortality of individuals. Human activities associated with forestry and woodland actions could increase noise and visual stimulants in habitats. These factors could disrupt nesting and foraging behaviors, could result in the species leaving the area or abandoning nests, or could lead to individual nest failure and reduced reproductive success. A significant alteration of habitat could render suitable habitat uninhabitable for SSS.

Timber and woodland harvest activities, including the construction of timber access roads, could result in the direct and indirect loss of special status plant species and their habitat. Additionally, authorized collection of seeds within special status plant species habitat could result in loss or damage to plants. Seeds are typically gathered by thrashing the plants with tennis rackets. Motorized vehicles are used as part of the collection activity. The inadvertent or deliberate collection of special status plant species seeds would reduce recruitment within the habitat, resulting in population loss.

Surface-disturbing activities such as the use of heavy machinery and equipment could contribute to decreased air quality. Decreased air quality could adversely affect SSS if it is significant within occupied habitat.

The clearing of woodlands could open areas that could be used by the Utah prairie dog both for burrows and forage.

Most of the special status plant species located in the RFO are not located in forested areas that would be impacted by commercial timber harvesting. However, construction of roads through viable and occupied habitat of SSS to access the timber could adversely impact SSS.

Alternative N would allow timber harvest in areas west of Capitol Reef National Park. Both the Rabbit Valley gilia (*Gilia caespitosa)* and last chance townsendia (*Townsendia aprica*) are located west of Capitol Reef National Park and could be adversely affected, as described previously.

Seed and Live Plant Collection

Alternative N would allow the commercial collection of live plants and seeds. Authorized collection of seeds within special status plant species populations and habitat can damage the plants. Seeds are typically gathered by thrashing the plants with tennis rackets. The collection of special status plant species seeds would also reduce recruitment within viable habitat, by reducing the number of viable seeds within an area. However, potential impacts would be reduced because of required NEPA analysis and consultation under Section 7 of the ESA for projects involving collection of special status plant species or their seeds.

Human activities associated with seed and live-plant collection can increase noise and visual stimulants in viable habitats of special status bird species. These actions could disrupt nesting and foraging behaviors and could result in the species leaving the area or abandoning nests. The actions could also lead to individual nest failure and reduced reproductive success.

Human activities associated with seed and live-plant collections could result in the trampling of burrows for Utah prairie dog and pygmy rabbit. These activities could also alter foraging behaviors within a population during the activities' duration. The collection of seeds within SSS habitat could reduce available forage for SSS or their prey.

Impacts from Livestock Grazing

The primary threats to SSS from the implementation of the livestock grazing program are surface-disturbing actions such as the construction of fences, water pipelines, cattle guards, wells, livestock ponds, and actual grazing activities. Although the threat would be minimized through the use of inventories, clearances, and mitigation, construction activities have the potential to directly impact special status plant species through individual mortality during construction efforts (e.g., crushing of plants from vehicles or fence posts). The construction of fences or livestock ponds has the potential to indirectly affect special status plant species by leading to concentrations of cattle in occupied habitat, thus resulting in trampling of plants. Similarly, placement of salt and mineral supplements could lead to cattle concentration in special status plant species habitats and could result in trampling of individuals. Non-structural grazing projects could include seeding, plowing, and herbicide spraying. Plowing and herbicide use could result in the direct mortality of populations and viable habitat. The alteration of habitat could have an indirect adverse effect on habitat for the pollinators of special status plant species.

Human activity from authorized construction and herding efforts in viable special status bird species habitats could disrupt nesting and foraging behaviors and could result in the species leaving the area or abandoning nests. The placement of salt and mineral supplements could lead to cattle concentration in special status bird species habitats and could result in the displacement of the species. Finally, non-structural grazing projects could include seeding, grazing, and herbicide spraying. These activities could alter the habitats used by special status bird species prey, and could result in disrupted foraging behaviors.

Livestock grazing management activities (construction of fences and water ponds, herding cattle, watering, and salting) within occupied prairie dog habitat could cause the direct mortality of individuals. Increased human activity during these projects could disrupt the foraging habits of the Utah prairie dog.

Conversion of Kind of Livestock and Adjusting Season of Use and Permitted Use

Adjusting livestock season of use could benefit SSS. Many special status plant species appear to be particularly susceptible to livestock grazing-related impacts during the spring, when the plants are sprouting, flowering, and fruiting. Most of the special status bird species thrive when there is little or no disturbance during breeding and nesting periods.

Studies conducted on the effects of grazing and habitat quality on the Utah prairie dog have shown strong associations between grazing season of use and prairie dog weight gain and reproduction. Adult weight gain was three times lower in complexes that were grazed in the summer than in complexes that were grazed in the spring or fall/winter (Ritchie and Cheng 2001). The BLM permits authorizing livestock grazing contain terms and conditions that specify livestock numbers and season-of-use, to ensure that an area is properly grazed. Livestock grazing in summer appears to be the most detrimental to Utah prairie dog populations. Fall or winter grazing was shown to have a beneficial effect on prairie dogs as compared to no grazing, because grazing can prevent vegetation from visually obscuring the horizon and can aid prairie dogs in detecting predators. Spring grazing could enhance prairie dog survival, but repeated annual spring grazing is likely to accelerate shrub invasion, leading to long-term Utah prairie dog habitat degradation. Fall and winter grazing may not reduce standing plant material enough to enhance prairie dog predator detection, especially in areas dominated by crested wheatgrass (*Agropyron cristatum*).

The ability to adjust livestock numbers because of unforeseen conditions such as drought also benefits SSS. During drought conditions, competition between livestock and wildlife is high and undesirable vegetation is consumed. This could include special status plant species. Additionally, livestock within special status animal species habitat such as the Utah prairie dog are in direct competition for forage. Livestock numbers that might have a beneficial effect or no effect to Utah prairie dogs in wet years could have detrimental effects during drought conditions.

The conversion of kind of livestock use could have adverse effects on special status plant species. For example, sheep have upper incisors, so sheep can graze more closely to the ground and impact vegetation more severely than can cattle. Thus, sheep within Utah prairie dog habitat could graze more forage used by the prairie dogs for survival than would cattle. Sheep also would eat a greater variety of plant species than cattle. Therefore, the introduction of sheep in a former cattle allotment could have detrimental effects by foraging on special status plant species and habitat.

Impacts from Recreation

Any form of recreational activity that increases noise and dust could adversely impact SSS by disturbing breeding, feeding, or sheltering activities. Motorized recreation has the greatest potential to affect SSS, particularly during the time of year when species are rearing young. Animals could be injured or killed by collisions with vehicles on designated routes, and plants could be crushed by vehicles. Disturbance could lead to emigration or an increased risk of predation.

Foot traffic through sensitive areas could disturb, injure, or kill SSS or prevent successful feeding or breeding activities. Recreational shooting activities might increase noise and trash in a localized area and could lead to injury or death of animals. Camping might cause minor to moderate impacts by disturbing animals, altering or removing habitat, crushing plants, increasing trash and debris in the area, and increasing the risk of wildfire. Animals might ingest foreign food substances that could cause illness or

death. Camping activities where pets are allowed to roam freely might also cause impacts to special status wildlife. Use restrictions on these types of activities should reduce or eliminate adverse effects.

Recreationists often use riparian areas because of the presence of shade, water, aesthetic values, and opportunities for camping, fishing, boating, swimming, and other activities. Impacts to these habitats could be detrimental to riparian obligate species by altering foraging, nesting, and mating behaviors. Extended recreational use in riparian areas could also result in sedimentation and compaction of soils, which could alter viable habitat for aquatic species.

Visitor use is expected to increase throughout the RFO. Under Alternative N, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified. OHV use in particular could lead to inadvertent damage to SSS and their habitat because of ease of access across a large portion of the RFO. Increasing recreational uses could also have adverse impacts on special status birds, particularly in riparian areas, displacing birds and degrading habitat.

Special recreation permits (SRPs) are issued to control visitor use and protect resources. Stipulations for protecting SSS, developed in consultation with USFWS, would be included in SRPs that would mitigate impacts to species and habitat, Mitigation could include actions such as limiting camping near springs or protecting raptors and nests from rock-climbing activities).

Impacts from Travel Management

Motorized activities in special status bird species habitats could disrupt nesting and foraging behaviors, resulting in the species leaving the area or abandoning nests. Frequently used OHV areas near nests or within home ranges of individual pairs could disturb nesting behavior on a long-term basis. This type of activity could also lead to individual nest failure and reduced reproductive success.

OHV use could degrade habitat, particularly meadow and shrub habitats that are vital to special status bird species prey. Noise produced by OHVs could disturb special status bird species at important nesting and roosting sites during critical periods.

OHV use in riparian habitats could result in the trampling, clearing, and cutting of vegetation; prevention of seed germination because of soil compaction; increased bank erosion and sedimentation; increased incidence of fire; introduction of exotic plant species; and noise disturbance. These impacts could result in adverse effects for SSS such as the Southwestern willow flycatcher, bald eagle, and yellow-billed cuckoo. Adverse effects could result from reduction of available foraging, roosting, breeding, and stopover habitats. OHV disturbance could increase the potential for nest abandonment or mortality of young and eggs.

Impacts of OHV use on special status plant species could involve habitat disturbance and increased access for illegal collectors. OHV use within SSS habitats could lead to direct mortality of the species (through the crushing of plants) and indirect mortality (through increases in erosion and sedimentation). For example, monitoring has shown that OHV use has had an adverse impact on special status plant species population in the Factory Butte area. The increasing use of OHVs on BLM land could also transport noxious and invasive weed seeds from infested areas to uninfested areas. Surface disturbance (e.g., crushing of vegetation, soil disturbance) associated with OHV use could increase native plant communities' susceptibility to weed establishment and could modify localized soil conditions until they are unsuitable for establishment by native species.

OHV use could result in adverse impacts to Utah prairie dogs; such impacts include damage to burrows, loss of forage, harassment, noise, and direct mortality. If OHV use occurs in occupied Utah prairie dog colonies, ground disturbances associated with these activities could cause burrows to collapse, thereby impacting Utah prairie dog colony structure and function. In addition, OHV use could destroy vegetation within and near Utah prairie dog colonies, thereby degrading potential foraging habitats. Increased human activity near prairie dog towns could alter typical activity patterns, leading to decreased nutritional health. OHV use could increase interactions between Utah prairie dogs and humans; if these interactions involve hunters, the potential for mortality of prairie dogs could also increase.

Restrictions on OHV use within SSS habitat would benefit the species by limiting disturbance. Under Alternative N, 1,636,400 acres would continue to be open to cross-country OHV use. This area includes some habitat for and populations of all the SSS located within the RFO. As stated previously, continued OHV use would result in adverse impacts to SSS. It is anticipated that OHV use would continue to increase in the future. As a result, adverse impacts to SSS in the RFO would also increase.

Under Alternative N, there would be 4,315 miles of open routes and 65 miles of closed routes. Alternative N does not take SSS into account when considering OHV route designations; the designations are based on the location of existing routes. Therefore, SSS could be adversely impacted by OHV route designation under this alternative.

Impacts from Lands and Realty

Land Tenure Adjustments

The effects of land tenure adjustments on SSS would be determined through site-specific environmental analysis for any proposed land disposals. Generally, lands containing listed plant and animal species habitat would not be considered for disposal. BLM could acquire lands that contain SSS habitat. Doing so would benefit SSS by providing protections that would not be afforded by non-federal ownership.

Withdrawals

Implementation of Alternative N would include recommending the four existing ACECs for mineral withdrawal, in addition to the existing withdrawals. Withdrawing these areas from mineral entry would reduce any adverse effects to SSS that could result from mineral development in these areas.

Rights-of-Way and Other Land Use Authorizations

ROWs or other land use authorizations (e.g., permits, leases, easements) could be proposed in populations and habitats for SSS. Construction of ROWs in SSS habitats could cause direct impacts to the habitat through trampling and other surface disturbance. Indirect impacts could include changes in hydrology or degradation of habitat because of increased sedimentation or habitat fragmentation. ROWs within viable or occupied SSS habitat could also degrade habitat through the introduction of invasive weeds.

Surface disturbances associated with ROWs and other land use authorizations could cause habitat loss or changes in vegetation structure, which could alter special status bird species' breeding and migratory habitats at or near disturbance locations. In addition, the construction, operation, and maintenance of ROWs could increase noise and human presence in otherwise remote areas and could increase stress levels of special status bird species. Increased human presence could disturb foraging and nesting behavior of special status bird species prey. The disturbance of individuals could result in reduced productivity or nesting success and increased likelihood of individual mortality.

If ROWs were authorized and developed in or near known populations of listed plant species, the habitat could be degraded, resulting in plant mortality.

Activities associated with ROW development (e.g., blading and grading of vegetation for construction of ROWs) could produce open areas that create ideal habitat for Utah prairie dogs. Blading and grading of habitat could also be beneficial to prairie dogs, by decreasing the vegetation height and therefore increasing visibility around existing colonies. When these disturbed areas are successfully reclaimed, the regrowth of native vegetation provides ideal forage for the prairie dog.

Construction and operation of roadway systems increase both traffic and visitation to otherwise remote areas. Increases in traffic and human presence could lead to increased mortality of special status animal species such as the Utah prairie dog, because of vehicle collisions and potential poaching (Laun 1957; Johnson and Collinge 2004).

ROW construction activities have the potential to result in short-term impacts to the Utah prairie dog, including damage to burrows, temporary displacement, loss of forage, and direct mortality. Potential long-term impacts include loss of habitat and disturbance from increased human presence, noise, and increased vehicular traffic on roadways. Direct habitat loss, including the conversion of habitat to agriculture, urban sprawl, and roadway development, have all been cited as reasons for population declines in prairie dogs (Smith 1955; Wuerthner 1997; National Wildlife Federation 2000; National Wildlife Federation and Environmental Defense 2002). Any direct habitat loss caused by ROW development in existing habitat (e.g., established prairie dog towns) or potential habitat (e.g., short grass prairie; low growing shrub lands) could adversely impact the Utah prairie dog.

Any new land use authorizations (e.g., ROWs, permits, leases, easements) would require consultation with USFWS and NEPA review, to minimize impacts to SSS. Under Alternative N, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas. Exceptions would be granted only when the proposed authorization would not create substantial surface disturbance or would create only temporary impacts. Thus, impacts to SSS in these avoidance areas would be negligible.

Wind and Solar Energy

According to the U.S. Department of Energy, National Renewable Energy Laboratory, the planning area has a low potential for wind and solar energy. Wind energy developments could potentially impact several special status plant and animal species. According to the *Final Programmatic Environmental Impact Statement on Wind Energy Development* (BLM 2005c), impacts to threatened and endangered species would include habitat disturbance, introduction of invasive weeds, individual mortality, erosion and runoff, fugitive dust, noise, exposure to contaminants, and interference with behavioral activities. That EIS notes that the operational impacts of most concern to ecological resources would be those associated with bird and bat strikes with turbines and associated infrastructure (e.g., transmission lines and meteorological towers) and to a lesser extent, electrocution of birds. Other concerns include habitat fragmentation, noise, and disturbance from human and vehicle activity.

Alternative N would include solar and wind energy exploration and development on a case-by-case basis. Any impacts to SSS would depend upon the type of project proposed. For example, the use of solar panels within a special status plant species population could block sunlight from the plants; or the use of wind turbines could result in collisions with special status bird species.

Impacts from Minerals and Energy

Construction and operation of facilities associated with mineral exploration could expand current roadway systems and increase both traffic and visitation to otherwise remote areas. Increased traffic could result in increased mortality of SSS from vehicle collisions, poaching, and trampling of habitat. In addition to

direct human-caused mortality, SSS could also be affected through exposure to spills or other sources of petroleum products.

Impacts from mineral development activities could include disturbances related to construction activities, noise from vehicles and equipment, seismic activities, increased human presence, and other related operations. Increased vehicle traffic could disturb special status bird species' nesting and roosting sites. Mineral and energy development typically disturb or remove vegetation and soil. When these activities are within special status bird species foraging habitat, the species can be adversely affected through a loss or decrease in food base. Exploration and production activities could result in increased human presence, increased noise levels, habitat fragmentation, and displacement of individuals.

Potential impacts of energy and mineral development to special status plant species include direct mortality caused by construction equipment and vehicles in occupied habitats. Also, habitat could be lost or modified by constructing well pads, pipelines, and associated facilities in occupied and suitable habitats or by disturbing habitat of the species' pollinators. Alternative N would protect Greater sage-grouse habitat by prohibiting surface disturbing activities near leks from March 1 through July 15, and within nesting/brooding habitat from April 1 through June 15. Other SSS that inhabit these areas would benefit from these stipulations (e.g., pygmy rabbit, Utah prairie dog).

Leasable Minerals—Oil and Gas

In December 2004, BLM and USFWS completed a programmatic consultation under Section 7 of the ESA, resulting in the development of a set of lease notices for listed species; this list is to be attached to oil and gas leases offered in the state. These lease notices, in conjunction with a threatened and endangered lease stipulation required by Instruction Memorandum (IM) WO 2002-174 and IM UT 2005-089, would alert potential lessees of the possible presence of listed species on the lease parcels. The notices would also inform potential lessees of restrictions and requirements that could be necessary at a future developmental stage. The lease notices and accompanying consultation memoranda are found in Appendix 11. These notices would apply to all the listed species found within the RFO. Application of the measures resulted in a "may affect, not likely to adversely affect" determination for the oil and gas leasing program.

Implementation of Alternative N would result in 1,236,500 acres (58% of the RFO) open to leasing subject to the standard terms and conditions; 409,200 acres (19%) open to leasing subject to moderate constraints (TL, CSU), 22,600 acres (1%) open to leasing subject to major constraints (NSO), and 459,700 acres (22%) closed to leasing. SSS that are located in areas that are open to leasing subject to the standard terms and conditions or that are open to leasing subject to moderate constraints (TL, CSU) include the Rabbit Valley gilia, Greater sage-grouse, pygmy rabbit, and other species. Fluid mineral development could adversely impact these species. Alternative N would protect Greater sage-grouse habitat by prohibiting surface disturbing activities near leks from March 1 through July 15, and within nesting/brooding habitat from April 1 through June 15. Other SSS that inhabit these areas would benefit from these stipulations (e.g., pygmy rabbit, Utah prairie dog).

Leasable Minerals—Coal

Any direct impacts of coal development on listed plant and animal species would be precluded by Coal Unsuitability Criterion 9, which states, "Federally-designated habitat for listed threatened or endangered plant and animal species or species proposed for listing…shall be considered unsuitable." Alternative N would protect Greater sage-grouse habitat by prohibiting surface disturbing activities near leks from March 1 through July 15, and within nesting/brooding habitat from April 1 through June 15. Other SSS that inhabit these areas would benefit from these stipulations (e.g., pygmy rabbit, Utah prairie dog).

Geophysical

Under Alternative N, the BLM would allow geophysical explorations outside of WSAs and existing ACECs. Geophysical exploration involves the use of OHVs and vehicles to lay geophones, to drill shot holes for charges, or to create a sound wave using all-terrain “thumper" vehicles instead of using charges. Vehicles are also used to remove the geophones and reclaim the shot holes (if used). Exploration for oil and gas (including coalbed natural gas) may also include the drilling of one or more wells to test for the reservoir and its productive viability. During the exploration phase of drilling, surface-disturbing activities include the construction of roads, well pads, reserve pits, and other facilities. Adverse impacts to SSS, which were described previously under Impacts from Minerals and Energy, might result from surface-disturbing geophysical activities. Alternative N would protect Greater sage-grouse habitat by prohibiting surface disturbing activities near leks from March 1 through July 15, and within nesting/brooding habitat from April 1 through June 15. Other SSS that inhabit these areas would benefit from these stipulations (e.g., pygmy rabbit, Utah prairie dog).

Locatable Minerals

SSS could be adversely affected (as described previously) by the surface-disturbing activities that would result from locatable minerals development. Under Alternative N, 169,480 acres would continue to be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent these types of activities from causing impacts to SSS. Alternative N would protect Greater sage-grouse habitat by prohibiting surface disturbing activities near leks from March 1 through July 15, and within nesting/brooding habitat from April 1 through June 15. Other SSS that inhabit these areas would benefit from these stipulations (e.g., pygmy rabbit, Utah prairie dog).

Salable Minerals

Alternative N allows the sale of mineral materials (salable minerals) on 1,668,300 acres (78% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted—it is likely that SSS do not occur in these areas. However, new sites would be subject to NEPA review and consultation with USFWS, thereby protecting SSS including Greater sage-grouse. Alternative N would protect Greater sage- grouse habitat by prohibiting surface disturbing activities near leks from March 1 through July 15, and within nesting/brooding habitat from April 1 through June 15. Other SSS that inhabit these areas would benefit from these stipulations (e.g., pygmy rabbit, Utah prairie dog).

Impacts from Special Designations

Wilderness Study Areas

Continued management of WSAs under the IMP would limit surface-disturbing activities that could adversely affect SSS. SSS located in WSAs include the Mexican spotted owl and bald eagle. WSAs are closed to leasing, precluding any impact from oil and gas development on SSS within these areas, and are managed as VRM Class I, which further restricts surface-disturbing activities.

Wild and Scenic Rivers

Under Alternative N, the outstandingly remarkable values, tentative classification, and free-flowing nature of all eligible river segments would be protected. SSS such as the Mexican spotted owl and bald eagle could benefit from continuing these protections because no surface-disturbing activities would be allowed within the SSS habitat in these areas.

Areas of Critical Environmental Concern

Under Alternative N, BLM would continue designation and special management of the four existing ACECs: Beaver Wash, North Caineville Mesa, South Caineville Mesa, and Gilbert Badlands. Habitat for

the Wright fishhook cactus, Mexican spotted owl, and bald eagle is located within these ACECs. ACECs provide limited protection for SSS by restricting many surface-disturbing activities.

Alternative A

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation

The types of impacts experienced as a result of riparian management would be similar to those described under Alternative N, except that the size of the buffer zone in which no surface disturbance would be allowed is 330 feet on each side of the riparian area under Alternative A (compared with 500 feet under Alternative N). Thus, Alternative A would protect a smaller area around the riparian/wetland zones from surface disturbance. However, projects to improve habitat conditions within these riparian zones (if they would benefit SSS) could still be performed, even within this buffer zone.

The types of impacts experienced as a result of vegetation management would be similar to those described under Alternative N. Under Alternative A, existing vegetation treatments would be maintained and new treatments to increase productivity and to achieve desired vegetation conditions would be implemented. Beneficial effects could result from many of these activities, which would include improved vegetation conditions. An increase in vegetation productivity could result in the introduction of native or non-native species that could directly compete with special status plant species through encroachment in occupied and potential habitat. Adverse effects could also result from the construction efforts associated with some vegetation treatments, as described previously under Alternative N.

The types of impacts experienced as a result of noxious weed and invasive species management would be similar to those described under Alternative N, except that implementation of Alternative A would likely result in additional acres being managed for invasive and noxious weed control. As a result, potential adverse short-term impacts to SSS could increase. However, potential long-term benefits would also be greater as a result of weed-control methods that would improve forage and habitat for special status animal species. SSS habitat would also be improved by the removal of invasive and noxious weeds, which compete for available space and resources.

Impacts from implementing insect pest management actions would be the same as those described under Alternative N.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative N, except that most cultural resource sites would be allocated and managed for public use under Alternative A. This allocation would emphasize public education and interpretation of cultural resources, which would increase visitation to sites. Human activities in special status bird species habitats could disrupt nesting and foraging behaviors and could result in the species leaving the area or abandoning nests. Ground dwelling species such as the Utah prairie dog and Greater sage-grouse could experience trampling of burrows and habitat degradation within the survey areas. These actions could also result in increased erosion, noise, and visual stimulants for the species. Human activities could disrupt foraging behaviors and could result in the abandonment of the areas. However, these activities would only affect relatively small, localized areas.

Alternative A identifies Horseshoe Canyon South WSA as an inventory priority area. SSS known to exist in the area include the Mexican spotted owl (*Strix occidentalis*), bald eagle (*Haliaeetus leucocephalus*), and Townsend's big-eared bat (*Corynorhinus townsendii*). Adverse impacts from inventories could result in localized habitat degradation, altered foraging behaviors, and nest abandonment.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced under Alternative A would be similar to those described under Alternative N, except that 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I under Alternative A. If SSS habitat overlaps with these areas, SSS would benefit because VRM Class I areas (which require preservation of the existing landscape) would restrict surface-disturbing activities.

Under Alternative A, none of the lands managed by the RFO would be designated as VRM Class II; 392,800 acres (18%) would be designated as VRM Class III; and 1,288,300 acres (61%) would be managed as VRM Class IV. Areas designated as VRM Class III or IV (79% of the RFO under Alternative A) would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the habitat for SSS. Alternative A designates more acres as VRM Classes III and IV than do any of the other alternatives.

Impacts from Special Status Species

Generally, impacts would be similar to those described under Alternative N. Alternative A would impose a one-quarter mile seasonal buffer (March 15 through June 1) for no surface disturbance or permanent structure around Greater sage-grouse leks, but wouldn't include restrictions on surface disturbing activities within nesting/brooding habitat. Therefore, this alternative provides less protection to sage-grouse and other SSS in these areas than Alternative N.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N. However, under Alternative A mitigation could be required in deer and elk habitats from December 15 through April 15 and in crucial desert bighorn habitat from April 15 through June 15. Implementation of these restrictions and mitigation measures could benefit SSS in these areas.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced under Alternative A would be similar to those described under Alternative N, except that under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually). Prescribed fires and wildland fires have the potential to adversely affect SSS. However, habitat manipulations through the use of fire could benefit SSS over the long term by improving vegetation conditions.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs would be proposed under Alternative A, resulting in no additional protection for SSS.

Impacts from Forestry and Woodland Products

Forest and Woodland Products Harvesting

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N, except that commercial and non-commercial harvesting would be allowed throughout the RFO (with the exception of WSAs) under Alternative A. Thus, impacts from this type of activity would occur over a larger area.

Seed and Live Plant Collection

The types of impacts experienced as a result of seed and live plant collecting would be similar to those described under Alternative N, except that the designation of specific areas for seed collection would be considered under Alternative A. If specific areas that exclude occupied SSS habitat were designated for seed collection, adverse effects that would result from seed and plant collection activities could be reduced. If occupied SSS habitat was considered for seed collection, NEPA analysis and Section 7 consultation would be required, reducing the potential for adverse impacts.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N, except that 36,950 more acres would be available for livestock grazing under Alternative A. Thus, impacts from surface-disturbing activities associated with the construction and implementation of range improvements (both structural and non-structural) could occur on additional acres. However, because this area represents a very small portion of the total RFO (less than 2%), impacts to SSS from implementation of Alternative A would be negligible.

Impacts from Recreation

The establishment of and management associated with SRMAs would provide for management at popular recreation use areas. Management of these areas would decrease the potential for inadvertent damage of SSS and their habitat, compared to Alternative N.

Under Alternative A, five SRMAs (514,500 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. This management would decrease the potential for such impacts to SSS as trampling, erosion, destruction of viable and occupied habitat, and the direct mortality of individuals. Limiting OHV use in the Otter Creek Reservoir SRMA to designated routes would limit the extent of potential impacts.

The construction of recreation facilities in the Big Rock SRMA and the Sahara Sands SRMA would focus recreation use, minimizing impacts. Managing the Dirty Devil/Robbers Roost SRMA (290,000 acres) for primitive and semi-primitive recreation would reduce the potential for impacts to SSS by limiting OHV recreation use to designated routes. Managing the Factory Butte SRMA (199,700 acres) for a motorized recreational opportunity and allowing moderate to extensive landscape modification would have potentially major impacts and would result in continued impacts to SSS. However, this area is currently receiving heavy motorized use.

Alternative A allows vehicles to pull off of designated routes (outside WSAs) as much as 100 feet to either side of the centerline (for parking/staging) and as much as 300 feet to either side of the centerline (for camping). This allowance could result in vehicles generally impacting SSS and their habitat in these areas.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N, except that implementation of Alternative A would result in 449,000 acres that are

open to cross-country OHV use. These open areas include some populations of and some habitat for the Wright fishhook cactus and San Rafael cactus, both of which are federally listed species. OHV use within SSS habitats has the potential to lead to direct mortality of the species, through the crushing of plants, and indirect mortality, through increases in erosion and sedimentation. The increasing use of OHVs on BLM land could also transport noxious and invasive weed seeds from infested areas to uninfested areas. Surface disturbance associated with OHV use (e.g., crushing of vegetation and soil disturbance) has the potential to increase the susceptibility of native plant communities to weed establishment, and can modify soil conditions so that the soils are unsuitable for establishment by native species. OHV use in special status plant species habitat could provide increased access for illegal collectors.

Areas, including those that contain SSS habitat, that are either closed to OHV use or in which use is limited to designated routes would be protected from the surface-disturbing activities associated with this activity. Alternative A, which designates no areas as closed to OHV use and 1,679,000 acres as limited, would provide more protection to SSS than Alternative N would because substantially less areas are open to cross-country OHV use under Alternative A. Alternative A also proposes to limit OHV use to designated routes in Greater sage-grouse breeding (leks) and nesting habitats.

Under Alternative A, 4,312 miles of routes would be available for public use and 68 miles would be closed. Alternative A was developed to avoid threats to soil, watershed, vegetation, and SSS, with respect to route designations. Therefore, SSS could be protected when road restrictions are placed in areas in which OHV use is deemed to be a threat to a particular species. Under Alternative A, routes that are restricted or closed are located in areas in which SSS such as the Mexican spotted owl, pygmy rabbit, and the Wright fishhook cactus exist. Limited or no access to these areas would reduce adverse effects to SSS that could result from OHV use.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Implementation of Alternative A would have little or no effect on SSS. The existing withdrawals are located in picnic and camping areas that do not contain any known SSS populations or habitats.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that under Alternative A, there would be fewer ROW avoidance areas. However, because consultation with USFWS and NEPA review would be required for any new ROW or other land use authorization, impacts to SSS would be negligible.

Wind and Solar Energy

Implementation of Alternative A would allow wind and solar energy exploration and development throughout the RFO except for in WSAs and VRM Class I areas. The restriction of wind and solar energy exploration and development within WSAs and VRM Class I areas could indirectly benefit SSS such as the Mexican spotted owl and the Wright fishhook cactus, by eliminating surface-disturbing activities within these areas.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative A, 860,600 acres (40% of the RFO) would be open to leasing subject to the standard terms and conditions; 820,500 acres (39%) would be open to leasing subject to moderate constraints (TL, CSU); and 446,900 acres (21%) would be closed to leasing. SSS that are located in areas that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) include Rabbit Valley gilia, pygmy rabbit, Greater sage-grouse, and the California condor. Fluid mineral development could adversely impact these species. Potential impacts to SSS from fluid mineral development are greatest under Alternative A. Although this alternative provides protection to sage-grouse lekking habitat by prohibiting surface disturbing activities within ¼ mile of leks from March 15 through June 1, it doesn't provide protection against surface disturbing activities within sage-grouse nesting/brooding habitat. Therefore, this alternative is less protective of SSS inhabiting sagebrush communities than Alternative N.

Leasable Minerals—Coal

Generally, impacts would be the same as those described under Alternative N. However, in regards to Greater sage-grouse, this alternative provides less protection because it doesn't include restrictions on surface disturbing activities within nesting/brooding habitat.

Geophysical

The type of impacts experienced as a result of geophysical exploration would be the same as those described under Alternative N, except that under Alternative A, geophysical explorations would be allowed throughout the RFO, with the exception of WSAs, as determined through site-specific NEPA analysis. Alternative A therefore could result in more potential impacts to SSS than would Alternative N. For example, this alternative provides less protection to Greater sage-grouse because it doesn't include restrictions on surface disturbing activities within nesting/brooding habitat.

Locatable Minerals

The types of impacts experienced as a result of locatable minerals activities would be the same as those described under Alternative N. Under Alternative A, 154,700 acres would continue to be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts to SSS from these types of activities. This alternative would recommend the least amount of acres for mineral withdrawal, which could result in the most impacts to SSS. This alternative also provides less protection to Greater sage-grouse because it doesn't include restrictions on surface disturbing activities within nesting/brooding habitat.

Salable Minerals

The types of impacts experienced from the disposal of salable minerals would be the same as those described under Alternative N. Alternative A allows sale of mineral materials (salable minerals) on 1,681,100 acres (79% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted; it is likely that SSS do not occur in these areas. However, new sites would be subject to NEPA review and consultation with USFWS, which would protect SSS. If salable minerals exist within Greater sage-grouse habitat, this alternative would provide less protection than Alternative N because it doesn't include restrictions on surface disturbing activities within nesting/brooding habitat.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible rivers would be recommended or managed as suitable. The outstandingly remarkable values, tentative classification, and free-flowing nature of these river segments would not be protected. Thus, SSS such as the Mexican spotted owl and bald eagle would not receive any additional benefit.

Areas of Critical Environmental Concern

Under Alternative A, no ACECs would be designated. No special management to protect relevant and important values would be provided to SSS or their habitat. Impacts, however, would be little changed from Alternative N because three of the four ACECs are within WSAs and the other—North Caineville Mesa—is virtually inaccessible. ACECs provide limited protection for SSS by restricting many surface-disturbing activities.

Proposed RMP

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation

Impacts from riparian, vegetation, and noxious weeds/invasive species management would be the same as those described under Alternative A.

The types of impacts experienced as a result of insect pest management would be similar to those described under Alternative N, except that implementation of the Proposed RMP would allow for pest-control treatments when the area economic threshold is exceeded. This action would likely be implemented only during large insect outbreaks, such as outbreaks of grasshoppers and Mormon crickets. The use of insecticides within viable and occupied special status plant species habitat during large outbreaks could benefit the species by reducing competition for available food. However, adverse impacts would also be realized in the form of decreased plant pollinators and reduced forage base for special status wildlife species.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative A, except that fewer cultural resource sites would be allocated and managed for public use. This allocation, which emphasizes public education and interpretation of cultural resources, would increase visitation to sites. However, human disruption to SSS would affect only relatively small, localized areas and would occur in fewer areas than under Alternative N or A.

The Proposed RMP would emphasize several new priority inventory areas. Many SSS are located in these inventory areas. Potential adverse effects to SSS as a result of cultural resources inventories would include surface-disturbing activities that could result in nest abandonment, habitat alteration, or loss of individual plants. Significance of the impacts would depend on the exact location of the designated area and the intensity of the inventory.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts under the Proposed RMP would be similar to those described under Alternative A. However, more acres would be designated as VRM Class I or II (696,700 acres, or 33% of the RFO), which would protect SSS by restricting surface-disturbing activities in these areas.

Under the Proposed RMP, 393,100 acres (18%) would be designated as VRM Class III and 1,038,200 (49%) would be managed as VRM Class IV. These areas, which can allow for greater landscape modification and therefore greater surface disturbance, could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the habitat for SSS. The Proposed RMP would designate more acres as VRM Class III or IV than would Alternative C or D, but fewer acres than would Alternative N or A.

Impacts from Special Status Species

Generally, impacts would be the same as those described under Alternative N. However, the Proposed RMP has additional protections for sage grouse habitat. This includes managing the area as open to leasing subject to major constraints (NSO) within ½ mile of Greater sage-grouse leks and prohibiting surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14 (see Appendix 11 for exceptions, waivers, and modifications). Implementation of these stipulations would directly benefit sage-grouse by protecting habitat during the breeding, brood rearing, and winter seasons. Other SSS that inhabit these areas would also benefit. Therefore, the Proposed RMP provides greater protection to sage-grouse and potentially other SSS than either Alternative N or A.

Impacts from Fish and Wildlife

Proposed actions such as habitat manipulations and range developments could result in short-term adverse impacts to SSS, such as Mexican spotted owl and bald eagle, and could detrimentally influence their behavior. Additionally, habitat manipulations and developments could also reduce populations and alter habitat of special status plant species such as Cronquist wild buckwheat.

Short-term adverse impacts could result from vegetation treatments that require the use of heavy equipment. Human disturbance and noise associated with the use of heavy equipment could temporarily disperse Mexican spotted owls and bald eagles from occupied habitats. Adverse direct impacts could also result from accidental chemical drift from pesticide use in nearby areas. These activities have the potential to remove suitable habitat or other desired vegetation for SSS. Additionally, habitat manipulations and developments could also reduce populations and alter habitat of special status plant species such as Cronquist wild buckwheat. Vegetation treatments would likely benefit SSS and their prey over the long-term by providing additional forage.

Implementation of the Proposed RMP would result in seasonal and spatial stipulations to protect desert bighorn sheep habitats during lambing and other sensitive times during their lifecycles. However, exceptions, waivers, and modifications could be granted on a case-by-case basis. Protective stipulations placed on crucial habitats that overlap with SSS' habitat would reduce adverse effects caused by surface-disturbing activities.

Surface-disturbing activities could contribute to decreased air quality and increased soil erosion, soil compaction, introduction and spread of invasive and noxious weeds, crushing of plants, habitat degradation, and the incidental take of listed wildlife species. Restrictions or stipulations of surface-disturbing activities within wildlife habitats that overlap with SSS habitat could benefit SSS within the restricted areas. The restrictions would reduce adverse effects incurred by surface disturbances that could harm SSS. The Proposed RMP would prohibit surface-disturbing activities in crucial deer and elk habitat

from December 1 through April 15, and in crucial desert bighorn habitat from April 15 through June 15. Mitigation measures would be required for pronghorn antelope from May 15 through June 15. However, exceptions, waivers, and modifications could be granted on a case-by-case basis. The additional surface restrictions and mitigations related to other wildlife species would indirectly benefit SSS located in these areas, by limiting habitat disturbance. SSS that would benefit from these surface restrictions include the Utah prairie dog, pygmy rabbit, Greater sage-grouse, Mexican spotted owl, and bald eagle.

Impacts from Wild Horses and Burros

The types of impacts experienced as a result of wild horse and burro management would be similar to those described under Alternative N, except that the Proposed RMP would manage the Canyonlands HMA for 60–100 wild burros. New burros could be introduced to maintain genetic variability. Under the Proposed RMP, activities including the introduction and gathering of wild burros would have the potential to adversely affect the Mexican spotted owl, as described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced under the Proposed RMP would be similar to those described under Alternative N, except that the Proposed RMP would include stabilization efforts to sustain ecosystems, improve public health, improve safety, and help communities protect infrastructure. Priority would be given to areas that pose a threat to life and property and areas with a potential for invasive weeds. As previously discussed, stabilization efforts would have the potential to benefit SSS through decreased erosion and improved habitat and vegetation conditions but would also result in short-term adverse impacts that would alter habitat.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, non-WSA lands with wilderness characteristics (78,600 acres) would be protected from impacts that could degrade wilderness values. This protection would limit impacts to SSS and their habitat, where those species and habitat lie within the protected lands. For example:

- Of 365,500 acres of Mexican spotted owl critical habitat within the RFO, 14,300 acres (4%) are within the non-WSA lands with wilderness characteristics managed for those characteristics. Protecting the wilderness characteristics areas would reduce or eliminate potential impacts to the owls and owl habitat within these areas.
- Of 364,300 acres of potential habitat for the Wright fishhook cactus, 20,900 acres (6%) are within the non-WSA lands with wilderness characteristics managed for those characteristics. Protecting the wilderness characteristics areas would likewise protect the cacti in these areas from surface-disturbing activities, notably cross-country OHV use.

Impacts from Forestry and Woodland Products

Forest and Woodland Products Harvesting

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N, except that commercial and non-commercial harvesting would be allowed throughout the RFO (with the exception of WSAs and the one suitable WSR corridor recommended under the Proposed RMP). Thus, impacts from this type of activity would occur over a larger area than under Alternative N but over a smaller area than under Alternative A.

Seed and Live Plant Collection

The types of impacts experienced as a result of seed and live plant collecting would be similar to those described under Alternative N, except that the designation of specific areas for seed and live plant collection would be considered under the Proposed RMP (with the exception of WSAs and the 1

recommended suitable WSR corridor). The exclusion of these areas from live plant and seed collection activities would reduce the adverse impacts to SSS that occupy these areas. If specific areas that exclude occupied SSS habitat are designated for seed collection, adverse effects that would result from seed and plant collection activities could be reduced. If occupied SSS habitat is considered for seed collection, NEPA analysis and consultation under Section 7 of the ESA would be required, thus reducing the potential for adverse impacts.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A. However, the Proposed RMP would establish five SRMAs (860,390 acres) to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. The Proposed RMP would propose 24,400 acres at Factory Butte and 90 acres at Big Rocks as OHV SRMAs, thereby decreasing the potential for impacts to SSS, as compared to Alternative A.

In the Factory Butte SRMA, no Threatened and/or Endangered (T&E) species (as per ESA of 1973) or Candidate plant species were found at any of the locations at which surface disturbance is proposed (Appendix 18). Therefore, no damage to T&E plants would be caused by the construction of fences or kiosks, but the presence of these facilities would help to effectively enforce OHV management prescriptions.

The Proposed RMP allows vehicles to pull off of designated routes (outside WSAs) as much as 50 feet to either side of the centerline (for parking/staging) and as much as 150 feet to either side of the centerline (for camping). Although these allowances could result in vehicles generally impacting SSS, the area of potential impact would be less than under either Alternative N or A.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N, except that implementation of the Proposed RMP would result in 9,890 acres that are open to cross-country OHV use. These open areas include populations and habitat of Wright fishhook cactus. OHV use could be more concentrated in this smaller area, and would likely have more adverse effects per acre. Impacts of OHV use on special status plant species could involve habitat disturbance and increased access for illegal collectors. OHV use within SSS habitats has the potential to lead to direct mortality of the species, through the crushing of plants by tires, and indirect mortality, through increases in erosion and sedimentation. The increasing use of OHVs on BLM land could also transport noxious and invasive weed seeds from infested areas to uninfested areas. Surface disturbance associated with OHV use (e.g., crushing of vegetation and soil disturbance) could increase the susceptibility of native plant communities to weed establishment and could modify soil conditions so that soils are unsuitable for establishment by native species.

Areas, including those that contain SSS habitat, that are either closed to OHV use or that limit use to designated routes would be protected from the surface-disturbing activities associated with this activity. The Proposed RMP designates 209,900 acres as closed to OHV use and 1,908,210 acres as limited, thus providing more protection to SSS than either Alternative N or A because substantially fewer areas are open to OHV use. The Proposed RMP would provide greater protection to Greater sage-grouse than Alternatives N and A by limiting OHV use to designated routes in all sage-grouse habitats including breeding (leks), nesting, brood-rearing and wintering habitats. The Proposed RMP also provides timing

limitations on surface disturbing or otherwise disruptive activities within breeding, brood-rearing, and winter habitat. These actions to protect sage grouse habitat would also benefit other SSS inhabiting sagebrush habitats (e.g., pygmy rabbit, Utah prairie dog).

Under the Proposed RMP, there would be 4,277 miles of routes available for use by the public, and 345 miles would be closed. The Proposed RMP designates routes to minimize harassment or significant disruption of wildlife. The Proposed RMP also gives special attention to SSS and their habitats. Many of the routes that are restricted or closed are located in areas in which SSS such as the Mexican spotted owl, last chance townsendia, Winkler pincushion cactus, Rabbit Valley gilia, pygmy rabbit, and the Wright fishhook cactus exist. Limited or no access to these areas would reduce adverse effects to SSS that could result from OHV use.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Implementation of the Proposed RMP would include recommending two ACECs (2,530 acres), one suitable WSR segment (5 miles), and developed recreation sites for mineral withdrawal. Several SSS, including Mexican spotted owl, Wright fishhook cactus, and Winkler pincushion cactus, are located in these areas. Withdrawing these areas from mineral entry would reduce adverse impacts to SSS that could result from mineral developments in these areas.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that fewer ROW avoidance areas would be proposed under the Proposed RMP. Because consultation with USFWS and NEPA review would be required for new ROWs or other land use authorizations, impacts to SSS would be negligible.

Wind and Solar Energy

Implementation of the Proposed RMP would allow wind and solar energy exploration and development throughout the RFO, except for in WSAs, ACECs, areas managed as open to leasing subject to major constraints (NSO), migratory bird habitats, raptor nesting complexes, threatened and endangered species habitats, and VRM Class I or II areas. The restriction on wind and solar development within these areas would likely benefit federally listed and non-listed special status bird species, including migratory species, by providing sites in which conflicts between birds and wind and solar facilities would be avoided. Potential species involved would include the Southwestern willow flycatcher, bald eagle, Mexican spotted owl, Greater sage-grouse, ferruginous hawk, Western yellow-billed cuckoo, and California condor. Restriction of wind and solar exploration activities located in WSAs and ACECs could indirectly benefit other SSS, such as the pygmy rabbit (*Brachylagus idahoensis*), that may be within those areas. The potential impacts that wind and solar energy would have on SSS would be less than under Alternative N or A because the Proposed RMP would include more areas in which restrictions would apply.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, 608,700 acres (29% of the RFO) would be open to leasing subject to the standard terms and conditions; 917,500 acres (43%) would be open to leasing subject to moderate constraints (TL, CSU); 154,500 acres (7%) would be open to leasing subject to major constraints (NSO),

and 447,300 (21%) would be closed to leasing. SSS that are located in areas that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) include the Rabbit Valley gilia, Greater sage-grouse, pygmy rabbit, and the California condor. Fluid mineral development could adversely impact these species. The Proposed RMP allows NSO within ½ mile of Greater sage-grouse leks and prohibits surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14 (see Appendix 11 for exceptions, waivers, and modifications). These stipulations provide greater protection to sage-grouse and other SSS that may inhabit these areas (e.g., pygmy rabbits) compared to Alternatives N and A.

Leasable Minerals—Coal

Generally, impacts would be the same as those described under Alternative N. However, the Proposed RMP allows NSO within ½ mile of Greater sage-grouse leks and prohibits surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14 providing greater protection to sage-grouse and other SSS that may inhabit these areas (e.g., pygmy rabbits) compared to Alternatives N and A.

Geophysical

The type of impacts experienced as a result of geophysical exploration would be the same as those described under Alternative N, except that under the Proposed RMP, geophysical explorations would be allowed throughout the RFO with the exception of WSAs, suitable WSR corridors (one segment with a tentative classification of Wild—5 miles), and ACECs (2,530 acres), as determined through site-specific NEPA analysis. The Proposed RMP therefore could result in more impacts to SSS than would Alternative N, C, or D but less than Alternative A. The Proposed RMP allows NSO within ½ mile of Greater sage-grouse leks year round and prohibits surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14. Therefore, it provides greater protection to sage-grouse and other SSS that may inhabit these areas (e.g., pygmy rabbits) compared to Alternatives N and A.

Locatable Minerals

The types of impacts experienced as a result of minerals and energy would be similar to those described under Alternative N. Under the Proposed RMP, 176,200 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to SSS. The Proposed RMP would recommend fewer acres for mineral withdrawal than would Alternative C or D but more acres than would Alternative N or A. The Proposed RMP allows NSO within ½ mile of Greater sage-grouse leks and prohibits surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14. Therefore, it provides greater protection to sage-grouse and other SSS that may inhabit these areas (e.g., pygmy rabbits) compared to Alternatives N and A.

Salable Minerals

The type of impacts experienced from the disposal of salable minerals would be the same as those described under Alternative N. The Proposed RMP allows the sale of mineral materials (salable minerals) on 1,680,700 acres (79% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted; it is unlikely that SSS occur in these areas. However, new sites would be subject to NEPA review and consultation with USFWS, which would protect SSS. If salable minerals exist within Greater sage-grouse habitat, the Proposed RMP would provide greater protection than Alternatives N and A because it allows NSO within ½ mile of Greater sage-grouse leks year round, and prohibits surface

disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 – March 14.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under the Proposed RMP, one river segment (the Fremont River in Fremont Gorge—5 total miles) would be recommended as suitable for WSR designation. Managing this area as suitable for inclusion in the National Wild and Scenic River System (NWSRS) would benefit species such as the Mexican spotted owl and bald eagle, both of which use this area. A lack of potential for surface-disturbing activities would also result in the protection of habitat used by the prey of the Mexican spotted owl.

Areas of Critical Environmental Concern

Under the Proposed RMP, two ACECs would be designated: North Caineville Mesa (2,200 acres) and Old Woman Front Research Natural Area (RNA) (330 acres). Habitat for the Wright fishhook cactus, Winkler pincushion cactus, and bald eagle is included within these ACECs. The ACECs would provide protection for SSS by restricting many surface-disturbing activities. Special management of these ACECs would include closing to OHV use, managing as a ROW avoidance areas, managing oil and gas leasing as open with NSO, unavailable for livestock grazing, and closed to harvesting of woodland products (Old Woman Front). These management prescriptions to protect relevant and important values would also protect the SSS that occur in the ACECs.

Alternative C

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation

The types of impacts experienced as a result of riparian management would be similar to those described under Alternative N, except that the size of the buffer zone in which no surface disturbance would be allowed would be 660 feet on each side of the riparian area under Alternative C (compared with 500 feet under Alternative N). Thus, Alternative C would protect a larger area around the riparian/wetland zones from surface-disturbing activities.

The types of impacts experienced as a result of vegetation management would be similar to those described for Alternative N, except that Alternative C would allow for vegetation management only through natural processes. Implementing this alternative would have no adverse effects on SSS, resulting from surface-disturbing or vegetation manipulation activities. However, the potential for beneficial impacts would be reduced because the types of treatment methods proposed under Alternative C could be less effective than conventional vegetation treatments and might not be effective in all vegetation communities. This reduction could result in the loss of existing vegetation cover, indirectly decreasing the ecological condition of the treated area.

The types of impacts experienced as a result of noxious weed and invasive species management would be similar to those described under Alternative N. However, implementation of Alternative C would initiate

an attempt to control noxious and invasive weeds through treatment methods that mimic natural processes. Implementation of this alternative could make control of some invasive species difficult because of lack of suitable substitute treatments; using fire as a control tool for species such as tamarisk, could increase the growth and spread of non-native species and could allow the spread of invasive species and displacement of desirable vegetation. This management could have indirect adverse effects on SSS because noxious and invasive weeds would likely expand their range and could alter suitable special status plant species habitat and reduce available forage for special status wildlife species such as the Utah prairie dog and the pygmy rabbit. In addition, weeds could compete with special status plant species for available space and nutrients. The short-term adverse effects that could result from surface-disturbing activities (as discussed under Alternative A) would not be realized. Beneficial impacts resulting from weed-control treatments through natural processes within SSS habitat would be limited.

The types of impacts experienced as a result of insect pest management would be similar to those described under Alternative N. However, implementation of Alternative C would result in no immediate beneficial or adverse impacts caused by pest control treatments within special status plant species habitat because no control measures would be implemented. However, SSS could be affected if insect pests proliferate to the point of removing large amounts of potential forage and thus changing the landscape or habitat.

Impacts from Cultural Resources

Impacts would be similar to those described under the Proposed RMP, except that fewer cultural resource sites would be allocated and managed for public use under Alternative C. This allocation, which emphasizes public education and interpretation of cultural resources, would increase visitation to sites. However, human disruption to SSS would affect only relatively small, localized areas and would occur in fewer areas than under Alternative N or A.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced under Alternative C would be similar to those described for the Proposed RMP. However, under Alternative C, more acres would be designated as VRM Class I or II (677,500 acres, or 32% of the RFO), which would protect SSS by restricting surface-disturbing activities in these areas.

Under Alternative C, 509,100 acres (24%) would be designated as VRM Class III and 941,400 (44%) would be designated as VRM Class IV. These areas, which would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance, could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short-term) the habitat for SSS. Alternative C would designate more acres as VRM Classes III and IV than would Alternative D but fewer acres than would Alternative N or A or the Proposed RMP.

Impacts from Special Status Species

Impacts would be similar as those described under the Proposed RMP. Although Alternative C does not include timing limitations on surface disturbing activities in sage grouse winter habitat, this habitat is mostly within crucial mule deer habitat which does have a timing limitation on such activities from December 15 through April 15.

The protections that do exist for sage-grouse under Alternative C would apply to other SSS whose habitat overlaps that of the sage-grouse (e.g., pygmy rabbit, Utah prairie dog).

Impacts from Fish and Wildlife

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under the Proposed RMP, except that Alternative C would implement seasonal and spatial stipulations to protect desert bighorn sheep habitats during lambing and other sensitive times during their lifecycles. Stipulations placed on crucial habitat management areas that overlap with SSS habitat would reduce adverse effects caused by surface-disturbing activities that could harm SSS.

Alternative C also prohibits surface-disturbing activities in crucial and high-value deer and elk habitat from December 1 through April 15, in crucial desert bighorn habitat from April 15 through June 15, and in crucial pronghorn antelope habitat from May 15 through June 15. The additional surface restrictions and mitigations related to other wildlife species would indirectly benefit SSS located in these surface-restriction areas, by limiting habitat disturbance. SSS that would benefit from these surface restrictions would include the Utah prairie dog, pygmy rabbit, Greater sage-grouse, Mexican spotted owl, and bald eagle.

Impacts from Wild Horses and Burros

The types of impacts experienced as a result of wild horse and burro management would be similar to those described under Alternative N, except that Alternative C would propose to manage the Canyonlands HMA for 120–200 wild burros. New burros could be introduced to maintain genetic variability. Under Alternative C, activities such as the introduction and gathering of wild burros would have the potential to adversely affect the Mexican spotted owl, as described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced under Alternative C would be similar to those described under the Proposed RMP, except that average annual treatments would be less under Alternative C (26,000 acres). As stated previously, prescribed fires and wildland fires have the potential to adversely affect SSS. However, habitat manipulations through the use of fire could benefit SSS over the long term through improved vegetative conditions. With fewer acres treated under Alternative C, there would be less potential adverse impacts but also less potential beneficial impacts resulting from habitat manipulations.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no additional protection for SSS.

Impacts from Forestry and Woodland Products

Forest and Woodland Products Harvesting

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N, except that commercial and non-commercial harvesting would be allowed throughout the RFO (with the exception of WSAs and suitable WSR corridors) under Alternative C. Thus, impacts from this type of activity would occur over a smaller area than under Alternative A or the Proposed RMP. In addition, the rejuvenating benefits to habitats resulting from the clearing of woodland areas would not be realized in the areas in which forest and woodland products harvesting was precluded.

Seed and Live Plant Collection

The types of impacts experienced as a result of seed and live plant collection would be similar to those described under Alternative N, except that the designation of specific areas for seed and live plant collection would be considered under Alternative C (with the exception of WSAs and suitable WSR corridors). The exclusion of these areas from live plant and seed collection activities would reduce the

adverse impacts to SSS that occupy these areas. If specific areas that exclude occupied SSS habitat were designated for seed collection, adverse effects that would result from seed and plant collection activities could be reduced. If occupied SSS habitats are considered as areas for seed collection, NEPA analysis and Section 7 consultation would be required, reducing the potential for adverse impacts. Alternative C would preclude more areas from seed and live plant collection than would Alternative N or A or the Proposed RMP but less than would Alternative D.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A. However, Alternative C would establish four SRMAs (930,000 acres) to manage recreational use and to mitigate impacts caused by this use. Alternative C would establish no SRMAs, thus decreasing the potential for impacts that this type of use could have on SSS.

Managing the Dirty Devil/Robbers Roost SRMA (375,800 acres) for dispersed recreation in a primitive setting would indirectly reduce the potential for surface disturbance (and associated damage to SSS) caused by recreation. Managing the Henry Mountains SRMA (533,900 acres) for primitive and semi-primitive recreation and managing the Sevier Canyon SRMA (7,500 acres) for scenic values would indirectly maintain or reduce the potential for disturbance and impacts to SSS. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities could have localized, site-specific impacts, although consultation with USFWS and NEPA review would be required prior to construction of any facilities.

Alternative C would allow vehicles to pull off of designated routes (outside WSAs) as much as 25 feet to either side of the centerline (for parking/staging); camping would be allowed only in designated campsites, with travel between campsites allowed only on designated routes. These management prescriptions would minimize disturbance to SSS and would result in less disturbance than under Alternative N or A or the Proposed RMP.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, under Alternative C, no acres would be open to cross-country OHV use; 1,445,000 acres would be limited to OHV use on designated routes only; and 683,000 acres would be closed to OHV use. By eliminating areas that are open to unrestricted OHV use, adverse impacts to SSS would be substantially reduced. As in the Proposed RMP, Alternative C would limit OHV use to designated routes in all sage-grouse habitats including breeding (leks), nesting, brood-rearing and wintering habitats.

Under Alternative C, there would be 3,192 miles of designated routes and 1,188 miles of routes that would be closed. Alternative C would designate routes to minimize harassment or significant disruption of wildlife. This alternative would also give special attention to SSS and their habitats. Many of the routes that are restricted or closed are located in areas that contain most of the SSS within the planning area. Limited or no access to these areas would reduce adverse effects to SSS that could result from OHV use.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Alternative C recommends withdrawing from mineral entry all or parts of several ACECs, suitable WSR corridors, and developed recreation sites (331,100 acres, or 16% of the RFO). Several SSS, including Mexican spotted owl, Wright fishhook cactus, pygmy rabbit, Rabbit Valley gilia, bald eagle, Utah prairie dog, and Winkler pincushion cactus, are located in these areas. Withdrawing these areas from mineral entry would reduce adverse impacts to SSS that could result from mineral developments.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that Alternative C would propose more ROW avoidance areas (735,000 acres closed to leasing or open to leasing subject to major constraints (NSO), 12 suitable WSR segments, and 16 ACECs). Because consultation with USFWS and NEPA review would be required, impacts to SSS would be negligible.

Wind and Solar Energy

Alternative C specifically excludes SSS habitats from wind and solar energy developments. This management would help to protect SSS (including bats, migratory birds, and raptors) from any surface-disturbing action that could result from these developments.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative C, 491,900 acres (23% of the RFO) would be open to leasing subject to the standard terms and conditions; 901,100 acres (42%) would be open to leasing subject to moderate constraints (TL, CSU); 148,700 acres (7%) would be open to leasing subject to major constraints (NSO); and 586,300 acres (28%) would be closed to leasing. SSS that are located in areas that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) include the Rabbit Valley gilia, Greater sage-grouse, and pygmy rabbit. Fluid mineral development could adversely impact these species. As under the Proposed RMP, this alternative provides stipulations to protect sage grouse breeding and brood-rearing habitat, however it does not allow for NSO within ½ mile of leks or provide timing limitations to protect winter habitat (see Appendix 11 for exceptions, waivers, and modifications). Therefore, it provides greater protection to sage-grouse and other SSS that may inhabit these areas (e.g., pygmy rabbits) compared to Alternatives N and A but less protection than the Proposed RMP.

Leasable Minerals—Coal

Impacts would be the same as those described under the Proposed RMP.

Geophysical

The type of impacts experienced as a result of geophysical exploration would be the same as those described under Alternative N, except that under Alternative C, geophysical explorations would be allowed throughout the RFO with the exception of WSAs, suitable WSR corridors (12 segments—135 miles), and ACECs (886,810 acres), as determined through site-specific NEPA analysis. Alternative C could result in more potential impacts to SSS than Alternative D but less impacts than Alternative N or A or the Proposed RMP.

Locatable Minerals

The types of impacts that would be experienced from locatable mineral activities would be the same as those described for Alternative N. However, under Alternative C, the location, exploration, and

development of locatable minerals could occur throughout the RFO, except in areas withdrawn from mineral entry (331,100 acres). These areas would include Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, Koosharem Picnic Area, Dirty Devil ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, Little Rockies ACEC, Rainbow Hills ACEC, and suitable WSR corridors. SSS located in the withdrawn areas would be protected from surface-disturbing activities that could result from locatable minerals activities.

Salable Minerals

The types of impacts experienced from the disposal of salable minerals would be the same as those described for Alternative N. This alternative allows the sale of mineral materials (salable minerals) on 1,541,700 acres (72% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted; it is unlikely that SSS occur in these areas. However, new sites would be subject to NEPA review and consultation with USFWS, which would protect SSS. Alternative C provides greater protection to sage-grouse habitats than Alternatives N and A, but less protection than the Proposed RMP.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative C, the Dirty Devil River, Beaver Wash Canyon, Larry Canyon, No Man's Canyon, Robbers Roost Canyon, Sams Mesa Box Canyon, Twin Corral Box Canyon, Fish Creek, Maidenwater Creek, Quitchupah Creek, and the Fremont River in Fremont Gorge and below Capitol Reef National Park to the Caineville ditch diversion would be designated as suitable WSRs. Management to protect their outstandingly remarkable values, tentative classification, and free-flowing nature (including closing to OHV use, closing to leasing, and withdrawing from mineral entry) would benefit the Mexican spotted owl and bald eagle.

Areas of Critical Environmental Concern

Under Alternative C, 16 areas (886,810 acres) would be designated as ACECs: Badlands, Bull Creek, Dirty Devil, Fremont Gorge/Cockscomb, Henry Mountains, Horseshoe Canyon, Kingston Canyon, Little Rockies, Lower Muddy Creek, Old Woman Front, Parker Mountain, Quitchupah, Rainbow Hills, Sevier Canyon, Thousand Lakes Bench, and Special Status Species ACECs. These ACECs contain populations and habitat for all SSS within the RFO. ACECs provide protection for SSS by restricting many surface-disturbing activities, including mineral leasing, OHV use and other motorized recreational activities, wood cutting, and new ROWs.

The Special Status Species ACEC contains 15,100 acres of land that is specifically designated to protect SSS from surface-disturbing activities such as OHV use, adverse recreation impacts, land sales, new ROWs, vegetation treatments, open mineral leasing, and mineral disposals.

Alternative D

Impacts from Soil Resources

Impacts would be the same as those described under Alternative N.

Impacts from Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative C, except that fewer cultural resource sites would be allocated and managed for public use. This allocation, which emphasizes public education and interpretation of cultural resources, would increase visitation to sites. However, human disruption that cultural resource management would cause to SSS would affect only relatively small, localized areas and would occur in fewer areas than under any other alternative.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced under Alternative D would be similar to those described under Alternative C, except that more acres would be designated as VRM Class I or II (1,196,300 acres, or 56% of the RFO), thereby protecting SSS by restricting surface-disturbing activities in these areas.

Under Alternative D, 355,100 acres (17%) would be designated as VRM Class III and 576,600 (27%) would be managed as VRM Class IV. These areas, which would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance, could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the habitat for SSS. This alternative designates far fewer acres as VRM Class III or IV than any other alternative, so impacts to SSS because of VRM class designations would be the least of all alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative C.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, non-WSA lands with wilderness characteristics (682,600 acres) would be protected from impacts that could degrade their wilderness values. This management would limit impacts to SSS and their habitat, where those species and habitat lie within the protected lands. For example:

- Of 635,100 acres within the RFO identified as potential brooding areas for the Greater sage-grouse, less than 1,000 acres are included within the non-WSA lands with wilderness characteristics. Protecting the wilderness characteristics areas would have little impact on the sage-grouse.

- Of 365,500 acres of Mexican spotted owl critical habitat within the RFO, 157,300 acres (43%) are within the non-WSA lands with wilderness characteristics. Protecting the wilderness characteristics areas would reduce or eliminate potential impacts to the owls and owl habitat within these areas.
- Of 364,300 acres of potential habitat for the Wright fishhook cactus, 206,400 acres (57%) are within the non-WSA lands with wilderness characteristics. Protecting the wilderness characteristics areas would likewise protect the cacti from surface-disturbing activities, notably cross-country OHV use, in more than half of the identified habitat.

Impacts from Forestry and Woodland Products

Forest and Woodland Products Harvesting

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N. However, under Alternative D, commercial and non-commercial harvesting would not be allowed in WSAs, suitable WSR corridors, or non-WSA lands with wilderness characteristics. Thus, impacts from this type of activity would occur over a much smaller area than under any other alternative, potentially providing the greatest benefit to SSS. However, the rejuvenating benefits to habitats from the clearing of woodland areas would not be realized.

Seed and Live Plant Collection

The types of impacts experienced as a result of seed and live plant collecting would be similar to those described under Alternative N, except that the designation of specific areas for seed collection (with the exception of WSAs, suitable WSR corridors, and non-WSA lands with wilderness characteristics) would be considered under Alternative D. The exclusion of these areas from live plant and seed collection activities would reduce the adverse impacts to SSS that occupy these areas. If specific areas that exclude occupied SSS habitat were designated for seed collection, adverse effects that would result from seed and plant collection activities could be reduced. If occupied SSS habitat was considered for seed collection, NEPA analysis and consultation under Section 7 of the ESA would be required, reducing the potential for adverse impacts. Alternative D would preclude more areas from seed and live plant collection than any other alternative, thus potentially providing the greatest benefit to SSS.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N, except that Alternative D would prohibit surface-disturbing activities associated with the construction and implementation of range improvements (both structural and non-structural) within non-WSA lands with wilderness characteristics (682,600 acres). This restriction would protect SSS in these areas by eliminating any potential for impact resulting from range-improvement construction.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative C, except that Alternative D would establish seven SRMAs (1,358,100 acres) to manage recreational use and to mitigate impacts caused by this use. No SRMAs would be established for OHV use, thereby decreasing the potential for impacts to SSS from this type of use. As described under Alternative C, the development of facilities could have localized site-specific impacts, although consultation with USFWS and NEPA review would be required prior to construction of any facilities.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described for Alternative N, except that under Alternative D, no acres would be open to cross-country OHV use;

972,800 acres would be limited to designated routes; and 1,155,200 acres would be closed to OHV use. The fewest potential impacts that OHV use would cause to SSS would occur under Alternative D.

Alternative D would propose 3,043 miles of designated routes and 1,242 miles of routes that would be closed. Many of the restricted or closed routes would be in areas that contain most of the SSS within the planning area. Reducing access to these areas would reduce adverse effects to SSS that could result from OHV use. The least impacts that route designations would cause to SSS would occur under Alternative D.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Alternative D would recommend withdrawing from mineral entry all non-WSA lands with wilderness characteristics, all or parts of several ACECs, suitable WSR corridors, and developed recreation sites (903,900 acres, or 42% of the RFO)—the most under any of the alternatives. Several SSS, including Mexican spotted owl, Wright fishhook cactus, pygmy rabbit, Rabbit Valley gilia, bald eagle, Utah prairie dog, and Winkler pincushion cactus, are located in these areas. Withdrawing these areas from mineral entry would reduce adverse impacts to SSS in these areas that could result from mineral developments. More than any other alternative, Alternative D would reduce potential impacts from mining activity.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance areas (1,203,800 acres closed to leasing or open to leasing subject to major constraints (NSO), 12 suitable WSR segments, and 16 ACECs) would be proposed under Alternative D. Because consultation with USFWS and NEPA review would be required for any new ROWs or other land use authorizations, impacts to SSS would be negligible.

Wind and Solar Energy

Impacts would be the same as those described under Alternative C.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative D, 290,200 acres (14% of the RFO) would be open to leasing subject to the standard terms and conditions; 634,000 acres (30%) would be open to leasing subject to moderate constraints (TL, CSU); 43,300 acres (2%) would be open to leasing subject to major constraints (NSO); and 1,160,500 acres (54%) would be closed to leasing. SSS in areas that are open to leasing or open to leasing subject to moderate constraints (TL, CSU) include the Rabbit Valley gilia, Greater sage-grouse, and pygmy rabbit. Potential impacts to SSS from fluid mineral development would be least under Alternative D than under any other alternative.

Leasable Minerals—Coal

Impacts would be the same as those described under the Proposed RMP.

Geophysical

Under Alternative D, BLM would allow geophysical explorations outside of WSAs, non-WSA lands with wilderness characteristics, WSR corridors, and ACECs, as determined through site-specific NEPA

analysis. Potential impacts to SSS from geophysical exploration would be least under this alternative (of any alternative) because the least amount of land would be available for this type of activity.

Locatable Minerals

The types of impacts that would be experienced from locatable mineral activities would be the same as those described under Alternative N. However, under Alternative D, the location, exploration, and development of locatable minerals could occur throughout the RFO, except in areas withdrawn from mineral entry (903,900 acres). These areas would include Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, Koosharem Picnic Area, Dirty Devil ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, Little Rockies ACEC, Rainbow Hills ACEC, suitable WSR corridors, and non-WSA lands with wilderness characteristics. SSS located in the withdrawn areas would be protected from surface-disturbing activities that could result from locatable minerals activities. Potential impacts to SSS from locatable mineral development would be least under this alternative, compared to the other alternatives.

Salable Minerals

With the implementation of Alternative D, 1,160,500 acres would be closed to disposal of salable minerals (WSAs, non-WSA lands with wilderness characteristics, the Dirty Devil ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, Little Rockies ACEC, Rainbow Hills ACEC, and within one-quarter mile of the high water mark on each bank of the river segment of suitable WSRs). The exclusion of these areas from surface-disturbing mineral materials activities would indirectly benefit SSS that are located within these areas. The disposal of mineral materials on other public lands would be allowed on a case-by-case basis. The potential impact to SSS from mineral material sales would be least under Alternative D (compared to the other alternatives).

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.3.9 Fish and Wildlife

The BLM manages public lands to provide suitable habitat for more than 600 fish and wildlife species. Species analyzed in this section include deer, elk, bison, antelope, bighorn sheep, and migratory birds. Impacts to fish and wildlife from other management programs include loss or alteration of native habitats, increased invasion of noxious weeds and other exotic weed species, decreased water availability, increased habitat fragmentation, changes in habitat and species composition, disruption of species behavior leading to reduced reproductive fitness or increased susceptibility to predation, and direct mortality. Surface-disturbing actions that alter vegetation characteristics (e.g., structure, composition, or production) have the potential to affect habitat suitability for fish and wildlife, particularly when the disturbance removes or reduces cover or food resources. Even minor changes to vegetation communities have the potential to affect resident fish and wildlife populations.

Wildlife populations fluctuate, sometimes widely, in response to natural factors such as the abundance of prey base or extremes in seasonal weather (e.g., severe winters, drought). These factors make it difficult to discern potential impacts on wildlife resulting from specific management actions and from impacts caused by natural factors. Changes or stressors to habitat components (vegetation, water, soil, or air) are likely to cause direct and indirect effects on wildlife and fish. Therefore, potential effects on habitats are the principal focus of this assessment.

Impacts on fish and wildlife include actions that result in habitat alteration, fragmentation, or loss; wildlife displacement; and habitat maintenance and enhancement. Habitat alteration occurs when decisions change the existing habitat character. Surface-disturbing activities, development, or other activities that degrade habitat lead to habitat alteration, fragmentation, or loss. Habitat alteration, fragmentation, and loss affect the usable ranges and routes for wildlife movement. Wildlife displacement occurs when land use activities result in the movement of wildlife into other habitats, increasing stress on individual animals and increasing competition for habitat resources. Impacts to fish and wildlife from displacement depend on the location, extent, timing, or the intensity of the disruptive activity or human presence. Occurrence of these disruptive activities in areas adjacent to fish and wildlife habitat could cause displacement of wildlife. Impacts from displacement would be greater for wildlife species that have limited existing habitat or a low tolerance for disturbance. Habitat maintenance and enhancement can maintain or improve the condition of vegetation and levels of forage species or reduce soil loss through vegetation treatments and restrictions on surface-disturbing activities.

Methods and Assumptions

The analysis of potential impacts to fish and wildlife resources is based on the expertise of BLM resource specialists at the RFO and the Utah State Office. Combined, these staffs possess an extensive knowledge of fish and wildlife resources within the planning area. The impact analysis is also based on review of existing literature and information provided by non-planning team experts in the BLM, the National Park Service (NPS), and other agencies.

Quantifying these impacts is difficult because of the lack of monitoring data for most species. In the absence of quantitative data, best professional judgment was used. Impacts are sometimes described using ranges of potential impacts or in qualitative terms, if appropriate. The intensities of impacts are also described, when possible.

The following assumptions were used in this analysis:

- All surface-disturbing activities would include mitigation to reduce impacts to wildlife resources. Analysis of impacts includes any and all mitigation measures in place.

- Sufficient habitat exists to maintain current fish and wildlife population objectives.
- Disruptive activities would displace wildlife, though some wildlife adaptation would occur.

Environmental Consequences

Impacts to fish and wildlife would likely result from actions proposed under the following resource management programs:

- Soil Resources and Water Resources
- Vegetation
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Wild Horses and Burros
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on fish and wildlife.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

Activities conducted under the soil management program are limited to monitoring, implementing support activities, providing information for other BLM programs, and recommending appropriate mitigation. Typical activities implemented under the soil resource program would include mapping soils, maintaining soil databases, identifying timing stipulations, and recommending protective measures for critical soils. For example, implementation of timing stipulations would reduce surface disturbance in areas with high seasonal erosion potential. Proposed decisions to increase soil productivity, reduce erosion, or maintain vegetation cover necessary to avoid accelerated erosion would maintain or improve wildlife habitat.

Implementation of water quality- and quantity-related actions would guide or advise other program actions and activities in a manner conducive to maintaining or improving surface water quality. These actions would be consistent with existing and anticipated uses and applicable state and federal water quality standards. Beneficial impacts include improved habitat for fish and wildlife (including migratory birds) and their associated prey.

Soil and water resources would be managed to avoid surface-disturbing activities within 500 feet of springs and streams, thus reducing or eliminating impacts to fish and wildlife species by preventing degradation of the water sources and associated wildlife habitat. In addition, goals to maintain or restore soil productivity, minimize accelerated soil erosion, and prevent flood or sediment damage would maintain or improve aquatic habitat and water quality for fish and wildlife species.

Impacts from Vegetation

Vegetation Treatments

Managing vegetation by using mechanical, chemical, and wildland or prescribed fire treatments could result in a mix of seral stages throughout the lands managed by the RFO. This management would provide cover, foraging, and nesting areas to maintain diverse wildlife populations. Treatments in pinyon-juniper woodlands, aspen, and sagebrush-steppe communities would return the treated areas to an earlier seral stage of succession, increasing vegetation species and structural diversity. Providing early seral habitats would foster small mammal populations, which serve as prey species for raptors and larger mammals. These habitats also would provide diverse forage and habitat for non-game, big game, prey species, and upland game birds and would create nesting habitat for birds. Vegetation treatments that result in mosaic patches of sagebrush of different ages and structures would benefit Greater sage-grouse. Vegetation manipulation to open closed-canopy communities and provide greater diversity in vegetation type and seral stage would benefit many species of birds and mammals, such as scrub jay and northern goshawk, while adversely affecting those species which prefer closed-canopy pinyon-juniper or sagebrush cover greater than 30%. Overall, proposed decisions for managing vegetation would have beneficial impacts on migratory birds and their habitats. Vegetation treatments could have short-term adverse impacts on migratory birds and their habitats because of loss of nesting habitats immediately following treatments, and could have long-term beneficial impacts as vegetation re-establishes.

Vegetation management activities include fencing, weed treatment, timber harvest, sagebrush management (spraying, mechanical treatment, or burning), and seeding of disturbed or weed-treated areas. Vegetation management activities, especially those using heavy equipment, would result in short-term adverse impacts to fish and wildlife and their habitat. Surface-disturbing activities could result in the alteration of habitat because of soil erosion or sedimentation. Large-scale vegetation management projects, such as sagebrush harrowing or juniper chaining, could impact fish and wildlife or their habitats in the sagebrush-steppe and pinyon-juniper woodlands vegetation types where such treatments would be conducted. No vegetation treatments are proposed in the non-vegetated and desert shrub vegetation types.

Under Alternative N, no acreage or treatment limitation is prescribed. Depending on the timing, location, and project size, treatments could have adverse or beneficial impacts on wildlife habitat; these impacts would be determined by site-specific environmental analysis. For example, in mule deer summer range, reducing the pinyon-juniper component would promote favorable forage conditions. Conversely, reducing sagebrush habitat that provides cover and forage for the Greater sage-grouse would reduce forage availability and canopy cover, rendering the sage-grouse vulnerable to predation.

Management Activities in Riparian and Wetland Areas

The purpose of the riparian and wetland management program is to maintain, restore, or improve riparian habitats. Proposed management actions that would be implemented to protect riparian areas include restrictions on time, space, placement, and the establishment of 500-foot buffer zones around riparian areas. (No surface-disturbing activities would be allowed around the outer edge of springs unless it could be shown that there were no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area.) These buffers would protect and enhance riparian vegetation communities that provide forage and cover for game and non-game mammals, as well as potential nesting sites for neo-tropical migratory birds, raptors, and waterfowl. However, the buffers could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Vegetation treatments and streambank stabilization projects would potentially result in short-term adverse impacts to fish and wildlife species whose habitat is located primarily in riparian and wetland areas. Streambank stabilization and habitat restoration projects could result in the removal of riparian vegetation in these areas. Impacts to fish and wildlife from these activities could include temporary disturbance or

loss of habitat from heavy equipment use, increased human presence, and associated noise. Vegetation treatments in riparian areas could include the use of herbicides, fire, or mechanical removal of exotic plant species such as tamarisk or Russian olive.

In the long term, vegetation treatments and streambank recontouring would likely benefit riparian obligate species by improving or enhancing riparian habitat. Additionally, beneficial impacts to upland species could result from maintaining or improving natural hydrologic watershed processes. Activities to maintain or improve riparian health; such as construction of livestock and recreation exclosures within riparian habitats and habitat rehabilitation projects, would have beneficial impacts on riparian obligate species.

All riparian areas are managed in accordance with the BLM Utah riparian policy. It is the objective of this riparian policy to improve or maintain riparian areas in proper functioning condition. Riparian areas are classified as in "proper functioning condition" when there is adequate vegetation and landform structure present to dissipate stream energy from high flows. This dissipation results in a reduction in erosion, improvement in water quality, filtration of sediment, capture of bedload, and aid in floodplain development. Properly functioning riparian areas also result in an improvement in flood water retention and groundwater recharge, development of root masses that stabilize streambanks against cutting action, development of diverse ponding and channel characteristics necessary for fish production and other uses, and greater support for biodiversity. Continuing to implement this policy would minimize impacts on wildlife species (including migratory birds) that inhabit riparian and wetland areas.

Invasive Species Management

Under Alternative N, approved weed control methods (including preventative management and mechanical, biological, and chemical techniques) would be allowed. Generally, controlling noxious and invasive species would be beneficial for wildlife habitat. However, some species considered invasive (e.g., tamarisk and Russian olive) provide important habitat components for neo-tropical songbirds. Treating noxious weeds could have short-term adverse and long-term beneficial impacts on some species of migratory birds. For example, removing tamarisk would result in lost habitat for Southwestern willow flycatcher and other riparian obligate species until willow communities were re-established.

Depending on the timing, location, and project size, weed treatments could have adverse or beneficial impacts on wildlife habitat; these impacts would be determined by site-specific environmental analysis. Use of herbicides or other chemicals to treat vegetation could impact fish and wildlife species by altering erosion patterns and introducing herbicides and chemicals into the hydrologic system. Increased sediment, loss of habitat integrity, fragmentation of hydrologic networks, and potential chemical introductions could impact water quality. Biological treatments would not cause short-term alteration or displacement of species because the treatments would be implemented over longer periods of time and would be host-specific.

Insect Pest Management

Wildlife could benefit from treatments that target destructive insects such as grasshoppers, cutworms, and Mormon crickets. Actions taken to remove destructive insects would reduce potential competition for available forage. Adverse impacts could also result from accidental chemical drift of pesticides used in nearby areas. Ingestion of pesticides could lead to direct mortality of individual animals or could cause decreased survival of young.

Control of insects in localized areas would likely result in adverse impacts to wildlife species in those areas. The reduction of some specific insect populations within special status bird habitats could alter foraging and nesting behavior by reducing the prey base and by requiring the birds to travel further to

forage. The short-term reduction in herbivorous insects could also result in changes to surrounding vegetation. If insect populations were substantially reduced over a long period, special status bird species could disperse from currently occupied areas, in an effort to find a larger forage base.

Impacts from Visual Resources

In general, VRM class designations would limit or allow surface-disturbing activities in certain areas, thereby affecting wildlife species. VRM Classes I and II, which preserve or retain the existing character of the landscape, would protect wildlife by restricting ground-disturbing activities; VRM Classes III and IV would provide less protection by allowing more changes to the landscape and by being less restrictive of ground-disturbing activities. Under Alternative N, none of the lands managed by the RFO would be classified as VRM Class I; 529,500 acres (25%) would be managed as VRM Class II; 569,000 acres (27%) would be managed as VRM Class III; and 1,029,500 acres (48%) would be managed as VRM Class IV. Managing areas as VRM Class II would reduce surface disturbance and retain existing vegetation, thereby protecting wildlife and wildlife habitat. However, meeting VRM Class II objectives could result in some adverse impacts to migratory birds and their habitats by limiting vegetation treatment options.

Areas managed as VRM Class III or IV (75% of the RFO under this alternative) would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) wildlife habitat.

Impacts from Special Status Species

Implementation of the SSS program is designed to manage threatened, endangered, candidate, and sensitive species and their habitat. Activities associated with management of SSS could include conducting surveys, habitat improvement projects, and closing areas that contain populations or suitable habitat for SSS to OHV use or other surface-disturbing activities. Under this Alternative, surface-disturbing activities are prohibited near Greater sage-grouse leks from March 1 through July 15 and within nesting/brooding habitat from April 1 through June 15. These stipulations would benefit all wildlife inhabiting these areas. Similarly, protections afforded special status plant species from surface-disturbing and disruptive activities would benefit wildlife and their habitat. These decisions would, in general, minimize impacts that other resource and resource uses and surface-disturbing activities would have on fish and wildlife (including migratory birds) and associated habitat.

Impacts from Fish and Wildlife

Habitat manipulations, such as prescribed burns and chemical and biological controls, typically are used to improve habitat for wildlife. Although the continued maintenance or improvement of wildlife habitats could hold some long-term benefits, there could be short-term adverse impacts such as loss or fragmentation of habitat, loss of individuals because of redistribution of grazing herbivores, or hydrologic changes that could result in temporary sedimentation or changes in natural water regimes. An increase in sedimentation could be particularly harmful to aquatic species in drainages or wetland areas; however, these potential impacts would be localized.

Alternative N would propose restrictions or stipulations of surface-disturbing activities within crucial bison habitat, and crucial deer and elk habitats. These restrictions or stipulations would also benefit other wildlife species within the restricted areas, by reducing adverse effects incurred by surface disturbances that could harm wildlife species. Surface disturbance restrictions in place for other areas (such as WSAs and eligible WSR corridors) would also benefit wildlife species within these areas. In areas in which there are no surface disturbance restrictions, impacts (such as decreased air quality, erosion, soil compaction,

introduction of exotic and noxious weeds, crushing of plants, and habitat modification) could cause mortality to wildlife and disruption to foraging or reproductive behavior.

Alternative N would provide no seasonal or spatial restrictions on surface-disturbing activities in desert bighorn habitat but would require compliance with the *Desert Bighorn Sheep Management Plan.* This plan includes the following goals: 1) Establish optimum populations of bighorn sheep in all suitable habitats within the state; 2) provide good-quality habitat for healthy populations of bighorn sheep; and 3) provide high-quality opportunities for hunting and viewing of bighorn sheep. However, this management plan lacks specific direction on actions to protect bighorn sheep and their habitat from surface-disturbing activities (such as oil and gas development), so potential adverse impacts could be substantial.

Under Alternative N, wildlife reintroductions could be allowed into historic ranges. Wildlife reintroductions could increase species and genetic diversity, augment existing populations, and re-establish species that were previously extirpated.

Impacts from Wild Horses and Burros

Alternative N would allocate 100 AUMs for wild burros in the Canyonlands HMA. Burros compete with wildlife (notably antelope and bighorn sheep) for water and forage. In addition, authorized wild burro activities could impact wildlife habitat during the life of the Proposed RMP. The presence of wild burros and subsequent herd gathering-related actions could adversely impact wildlife through noise, construction of temporary gathering structures, and the trampling of habitat. Herd gathering is conducted by using hazing techniques such as low-flying helicopters, vehicles, and gathering pens. These activities could disrupt foraging behaviors.

Impacts from Fire and Fuels Management

The focus of this analysis is on fire management activities, including wildfire suppression, prescribed fire, and non-fire fuel treatments, rather than on the impacts of wildfire itself. Actions associated with fire management could adversely affect fish and wildlife species and their habitat.

Increased human activity and noise associated with wildland fire suppression and prescribed fire would affect nesting, foraging, or roosting behavior. Foraging, nesting, and communal winter roosting habitats could be lost through the use of heavy equipment, hand tools, and noise associated with intensive human activity. Some snags used for perching, roosting, or nesting could be lost because of suppression operations. However, these snags could be replaced as new snags result from fire mortality. The effects from wildland fire suppression could potentially become long term, depending upon the severity and extent of the activities conducted during a particular fire suppression operation. Although a large fire that requires extensive suppression operations, such as extensive staging areas and fire line construction, could result in long-term adverse effects to fish and wildlife, smaller fires that require less-extensive suppression operations would generally avoid these long-term adverse effects.

Fire suppression activities could adversely affect fish and wildlife species and could cause immediate post-fire alteration or damage of crucial or high-value habitats. Suppression operations could result in harassment, displacement, injury, or mortality during staging, fire-line construction, backburning, noise, or other human-caused disturbance. Any direct adverse effects would generally be short term, ending when or shortly after suppression actions are concluded. However, surface-disturbing operations conducted during fire suppression would result in a reduction or loss in quantity and quality of cover and forage habitat in both the grassland and sagebrush habitats. These activities would reduce forage availability, damage or destroy burrows or colonies, and remove the sagebrush and shrubs that provide above-ground vegetation cover. Despite the immediate initial loss of forage and shrub cover, some suppression tactics (e.g., backburning operations) or emergency restoration actions would actually stimulate vigorous regrowth of forb species in the following growing seasons. This regrowth would

benefit fish and wildlife species through improved forage quality and quantity as well as through greater visibility for detecting predators.

A large fire event and associated suppression activities could result in the deposition of large amounts of sediment and ash into local river systems. Aquatic species could experience water quality degradation for a short-term period. However, no long-term adverse impacts to the river system would be anticipated. Any fire retardant inadvertently deposited into the river system would likely dissipate and therefore not affect any aquatic species. Because prescribed fire-related actions tend to be limited in scope and smaller than major wildfires, no long-term impacts would be expected.

Fire management activities could adversely affect fish and wildlife species by trampling individuals or habitat. Fire suppression activities also have the potential to result in increased erosion. The construction of fire lines by using hand tools and heavy machinery, and the fire itself, could result in direct disturbance to individuals or the alteration of habitat. In addition, the presence of invasive weeds could result in fires burning in areas in which they did not previously burn.

Under Alternative N, prescribed fires and other treatment methods would be used to reduce hazardous fuels, with no acreage limitation established. Prescribed fire management activities, including fire-line construction and use of staging areas, could adversely affect fish and wildlife species by trampling individuals, crushing burrows, or altering habitat, as previously described. However, habitat manipulations resulting from the use of fire would also benefit species over the long term, through improved vegetative conditions.

Alternative N would include stabilization and rehabilitation efforts as needed for every wildland fire. Stabilization and rehabilitation efforts would benefit fish and wildlife species over the long term by decreasing erosion and restoring or improving habitat conditions following a fire event, although there could be short-term adverse impacts. The planting of non-native species that could out-compete native plant species used by wildlife species would alter habitat conditions and make them less favorable. The use of heavy equipment could result in the direct mortality of individuals and segmentation of populations. Increased human activity during construction efforts could cause bird species to alter foraging, nesting, and roosting behaviors.

Hazardous fuels reduction treatments would be allowed under Alternative N, with no acreage or treatment limitations prescribed. Depending on the timing, location, and project size, treatments could have adverse or beneficial impacts on wildlife habitat; these impacts would be determined by site-specific environmental analysis. For example, in mule deer summer range, reducing the pinyon-juniper component would promote favorable forage conditions. Conversely, reducing sagebrush habitat that provides cover and forage for the Greater sage-grouse would reduce forage availability and canopy cover, rendering the sage-grouse vulnerable to predation.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for fish and wildlife.

Impacts from Forestry and Woodland Products

Forestry and woodland management actions would include the harvesting of firewood, poles, Christmas trees, pine nuts, timber, and seed collection. Commercial forestry activities (e.g., timber harvests and sales) would be restricted to upland forests. These activities could include the use of heavy equipment, helicopters, chemical applications, road construction, and culvert installation, and typically would result in increased traffic, noise, and human presence.

The implementation of forestry management actions that reduce pinyon-juniper woodland invasion would benefit those species that require open space. The clearing of old, dense, relatively less-productive woodlands could open up more productive areas that could be used by wildlife species.

Potential adverse impacts to bird species could include loss of habitat, increased human access to remote habitats because of new road construction, increased noise, increased human activity, overspray or drift of chemical treatments, and culvert installation or waterbar construction, all of which could alter riparian function. These activities could result in habitat loss or fragmentation, displacement of individuals, reduction in prey base, or direct mortality of individuals. Human activities associated with forestry and woodland actions could increase noise and visual stimulants in habitats, thereby disrupting nesting and foraging behaviors and possibly resulting in the species leaving the area or abandoning nests. These activities could also lead to individual nest failure and reduced reproductive success. A significant alteration of habitat could render suitable habitat uninhabitable for wildlife species.

Impacts from Livestock Grazing

The effects of livestock grazing on wildlife could include direct competition for forage, water, and space and indirect habitat alteration through range improvements. The impacts of livestock grazing management on stream processes and fish habitats include the short-term and site-specific loss of stabilizing riparian vegetation, which could lead to stream instability and an associated loss of habitat complexity; the loss of shading vegetation, which could lead to elevated stream temperatures and increased sediment delivery; and the loss of stream channel complexity provided by fluvial process and woody debris. These impacts could vary depending on livestock grazing intensity, site characteristics, and species habitat requirements. Improving livestock grazing allotments to meet the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* would enhance fish and wildlife habitat in the long term by increasing the amount of desirable vegetation cover, structure, and species diversity, thereby improving water quality, aquatic species habitat, and wildlife species diversity. Meeting the Utah SRH would also result in some benefits to migratory birds and their habitat because of the SRH prescriptions for improving rangeland and riparian conditions.

The ability to adjust livestock numbers because of unforeseen conditions such as drought also would benefit wildlife species. During drought conditions, competition between livestock and wildlife is high, and undesirable vegetation is consumed. Livestock numbers that might have a beneficial effect or no effect to wildlife in wet years could have detrimental effects during drought conditions.

Domestic sheep can transmit diseases to bighorn sheep. Under Alternative N, domestic sheep grazing could continue in bighorn sheep habitat, thereby having potentially adverse effects on wildlife.

Impacts from Recreation

Any form of recreational activity that increases noise and dust could adversely impact fish and wildlife resources by disturbing breeding, feeding, or sheltering activities. Wildlife resources could be impacted by disturbance associated with commercial recreation or competitive events, depending upon the nature, location, and duration of the action. Some wildlife might be injured or killed as a result of such activities. Vehicular events, particularly those held during the time of year when species are rearing young, would have the greatest potential to affect wildlife. Animals could be injured or killed by collisions with vehicles on designated routes. Disturbance could lead to emigration or an increased risk of predation. Although Alternative N would include provisions to alter recreational activities that affect sensitive areas or species, such provisions would not be enforced until after monitoring had detected the impacts.

Foot traffic through sensitive areas could disturb, injure, or kill wildlife or prevent successful feeding or breeding activities. Recreational shooting activities might increase noise and trash in a localized area and could lead to injury or death of animals. Camping might cause minor-to-moderate impacts to wildlife

resources by disturbing animals, altering or removing habitat, increasing trash and debris in the area, and increasing the risk of wildfire. Animals might ingest foreign food substances that could cause illness or death. Camping activities in which pets are allowed to roam freely might also cause impacts to wildlife. Use restrictions on these types of activities should reduce or eliminate adverse effects to wildlife.

Recreationists often use riparian areas because of the presence of shade, water, aesthetic values, and opportunities for camping, fishing, boating, swimming, and other activities. Impacts to these habitats could be detrimental to riparian obligate species (such as migratory birds), by altering foraging, nesting, and mating behaviors. Extended recreational use in riparian areas could also result in sedimentation and compaction of soils, which could alter viable habitat for fish and other aquatic species.

Visitor use is expected to increase throughout the RFO. Under Alternative N, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) would be identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified. OHV use in particular could lead to inadvertent damage to wildlife species and their habitat because of ease of access across a large portion of the RFO. Increasing recreational uses could also have adverse impacts on migratory birds, displacing birds and degrading habitat, particularly in riparian areas.

SRPs are issued to control visitor use and protect resources. Stipulations for protecting wildlife resources (e.g., limiting camping near springs, protecting raptors or nests from rock climbing activities) could be included in SRPs, which would mitigate impacts to species and habitat.

Impacts from Travel Management

OHV use within wildlife habitat areas could adversely impact wildlife by harassing and displacing animals and damaging vegetation. OHV recreation use on big game crucial winter range could lead to loss or alteration of habitat and forage and could cause displacement and physiological stress during the winter. If the disturbance were to become chronic or continuous, these impacts could result in reduced animal fitness and reproductive potential (Geist 1978). Unregulated OHV use in sagebrush habitat could be detrimental to Greater sage-grouse populations. Although some birds might be able to adjust by using adjacent sagebrush habitats, sage-grouse hens show fidelity for nesting in the same general area (WGFD 2003). Limiting OHV recreation use to designated routes in sage-grouse breeding and nesting habitat would localize impacts. However, impacts associated with human presence and noise from OHVs would result in displacement or harassment during sensitive lifecycles and could also result in nest abandonment. In addition to sage-grouse, other sagebrush obligate species would be impacted by human presence, noise from OHVs, and habitat degradation.

Cross-country OHV recreation in open areas could result in modification of forage composition and habitat. This change in composition and structure could result in displacement of wildlife. This activity could impact raptor and Greater sage-grouse nesting sites, sage-grouse leks and brood rearing areas, big game fawning and calving areas, and all crucial winter habitats. Unrestricted OHV use could also impact migratory birds by causing harassment, direct mortality, nest abandonment, and habitat alteration. In addition, cross-country OHV recreation use could alter the landscape, resulting in indirect impacts such as increased erosion, siltation, sediment loading, and introduction of invasive species into riparian and aquatic habitats.

Designating areas as limited to designated roads or limited seasonally would provide greater protection for fish and wildlife and associated habitat than would designating open areas. Designated routes would minimize alteration and destruction that cross-country OHV use could cause to habitat components. Designating areas as closed to OHV recreation use would further reduce surface disturbance and habitat modification. This management action would remove potential impacts to fish and wildlife and associated

habitat by limiting alteration to habitat components and disturbance associated with OHV use and human presence.

Proposed decisions to designate areas as open, closed, or limited to OHV use could have impacts on migratory birds and their habitats as well. In areas open to cross-country travel, migratory birds could be adversely impacted by habitat alteration, habitat fragmentation, and direct mortality from vehicle use. Adverse impacts would be less in areas in which vehicles were limited to designated routes. Closed areas, in which vehicle use is prohibited, would protect migratory birds and their habitats from vehicle disturbance. Under Alternative N, 1,636,400 acres would continue to be open to cross-country OHV use. As stated previously, continued OHV use would result in adverse impacts to fish and wildlife species. It is anticipated that OHV use will continue to increase in the future. As a result, adverse impacts to fish and wildlife in the RFO would also increase.

Proposed decisions to designate existing routes open to vehicle use, particularly routes in riparian areas, could adversely impact migratory birds because of habitat degradation and fragmentation caused by the routes and because of direct mortality caused by vehicle use. Conversely, proposed decisions to close routes would benefit birds and habitat by reducing degradation, fragmentation, and direct mortality. Proposed decisions to close routes seasonally, primarily to protect wildlife species such as deer, elk, bison, and Greater sage-grouse, would benefit migratory birds to the extent that closures overlapped with bird breeding seasons. Under Alternative N, there would be 4,315 miles of routes available for motorized use and 65 miles of routes that would be closed. In addition, this alternative would continue to seasonally close routes in crucial bison habitat at Swap Mesa and Cave Flat from December 20 through March 20, thus limiting disturbance to all wildlife species in these areas during that time period. Alternative N does not take into account crucial or high-value wildlife habitats when considering OHV route designations because these designations are based on location of existing routes. Therefore, wildlife species could be adversely impacted overall by OHV use under this alternative.

Continuing to manage the existing Piute and Great Western Trail systems would limit effects on migratory birds and habitat to existing disturbed areas (trails). Impacts of new additions to the trail systems would be addressed by site-specific analysis.

Impacts from Lands and Realty

Land Tenure Adjustments

The effects of land tenure adjustments on fish and wildlife species would be determined through site-specific environmental analysis for any proposed land disposal. Land disposals could result in losses of wildlife habitat, whereas acquisitions could result in gains of habitat. Acquisition of habitat would benefit fish and wildlife species by providing protections that would not be afforded by non-federal ownership.

Withdrawals

Alternative N would recommend the four existing ACECs (14,780 acres) for mineral withdrawal in addition to the existing withdrawals (154,700 acres). Withdrawing these areas from mineral entry would reduce any adverse effects to fish and wildlife that could result from mineral development in these areas.

Rights-of-Way and Other Land Use Authorizations

Construction of ROWs or other land use authorizations (e.g., permits, leases, easements) could cause direct impacts to habitat through trampling and other surface disturbance. Other indirect impacts could include changes in hydrology or degradation of habitat that could be the result of increased sedimentation or habitat fragmentation. ROWs could also degrade habitat through the introduction of invasive weeds.

Surface disturbances associated with ROWs and other land use authorizations could cause habitat loss or changes in vegetation structure, which could alter bird breeding and migratory habitats at or near disturbance locations. In addition, the construction, operation, and maintenance of ROWs could increase noise and human presence in otherwise remote areas and could increase stress levels. Increased human presence could disturb bird foraging, nesting behavior, and prey abundance. The disturbance of individuals could result in reduced productivity or nesting success and increased likelihood of individual mortality.

Activities associated with ROW development (e.g., blading and grading of vegetation for construction of ROWs) could produce open areas that create ideal habitat for some wildlife species. Blading and grading of habitat could also be beneficial to these species by decreasing the vegetation height and therefore increasing visibility around existing colonies. When these disturbed areas were successfully reclaimed, the regrowth of native vegetation would provide ideal forage.

Construction and operation of roadway systems increase both traffic and visitation to otherwise remote areas. Increases in traffic and human presence could lead to increased mortality of wildlife species from vehicle collisions as well as from poaching (Laun 1957; Johnson and Collinge 2004).

ROW construction activities could result in short-term impacts to other wildlife species as well, including damage to burrows, temporary displacement, loss of forage, and direct mortality. Long-term impacts could include loss of habitat and disturbance from increased human presence, noise, and vehicular traffic on roadways.

Any new land use authorizations (e.g., ROWs, permits, leases, easements) would require NEPA review, which would minimize impacts to fish and wildlife species. Under Alternative N, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas. Exceptions would be granted only when the proposed authorization would not create substantial surface disturbance or would create only temporary impacts. Thus, impacts to fish and wildlife species in these avoidance areas would be negligible.

Wind and Solar Energy

The planning area has a low potential for development of wind and solar energy. Wind energy developments could potentially impact fish and wildlife species. Impacts to fish and wildlife species (including migratory birds) would include habitat disturbance, introduction of invasive weeds, individual mortality, erosion and runoff, fugitive dust, noise, exposure to contaminants, and interference with behavioral activities. Operational impacts of most concern to ecological resources would be those associated with bird and bat strikes to turbines and associated infrastructure (e.g., transmission lines, meteorological towers) and to a lesser extent, the electrocution of birds. Other concerns would include habitat fragmentation, noise, and disturbance caused by human and vehicle activity.

Alternative N would allow solar and wind energy exploration and development on a case-by-case basis. Any impacts to fish and wildlife species would depend upon the type of project proposed. For example, the use of solar panels could block plants from sunlight; the use of wind turbines could result in collisions with special status bird species.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Wildlife habitat areas that would be open or closed to leasing vary by species and by alternative (Table 4-16 through Table 4-20). Under all alternatives, as many as 454 oil and gas wells could be developed,

directly disturbing 3,080 acres. Sixty-three percent of the surface disturbance would be in the Sevier Frontal Zone Play (USGS Play-1907), which contains elk and mule deer habitat. The effects of oil and gas leasing would depend on the location and degree of disturbance, the proximity to crucial habitats, and the need to develop roads. However, under the Proposed RMP, exceptions, waivers, and modifications to seasonal restrictions would in some cases allow development activities to occur in occur in crucial habitat (Appendix 11). Human impacts associated with minerals exploration and associated development would include habitat and forage losses or alterations. Indirect impacts to big game could include displacement and physiological stress caused by human presence and activity during the winter (Bromley 1985). The impacts described previously would not occur in areas that were closed to leasing and would be minimal in areas that were open to leasing subject to major constraints (NSO).

Leasable Minerals—Coal

The effects of coal resource development and production vary, depending on the location and degree of disturbance, the proximity to crucial habitats, and the need to develop roads that would cause surface disturbance. Surface mining of coal would impact crucial bison and mule deer habitat by disturbing surfaces and removing existing vegetation. Coal resource production sites often create areas of disturbed soil, providing areas for noxious weed infestations. However, this disturbance could convert vegetation to early seral stages, creating habitat for some wildlife species but reducing habitat for wildlife with mid-to-late seral habitat requirements. Seasonal restrictions on coal resource development would minimize stress to wildlife by limiting construction and other activities that could be disruptive to raptor nest sites, Greater sage-grouse leks, and wintering, calving, and lambing wildlife habitats. Migration/transition ranges and winter concentration areas for raptors could require intensive management to prevent the loss of habitat or to reduce stress. In any case, impacts to wildlife as a result of coal development would be addressed by site-specific environmental analysis.

Geophysical

Under Alternative N, BLM would allow geophysical explorations outside of WSAs and existing ACECs. Geophysical exploration would involve the use of OHVs and vehicles to lay geophones, to drill shot holes for charges, or to create a sound wave using all-terrain “thumper" vehicles instead of using charges. Vehicles also would be used to remove the geophones and reclaim the shot holes (if used). Exploration for oil and gas (including coalbed natural gas) might also include the drilling of one or more wells to test for the reservoir and its productive viability. During the exploration phase of drilling, surface-disturbing activities would include the construction of roads, well pads, reserve pits, and other facilities. Adverse impacts (including disturbance to reproductive and foraging activities, damage to habitat from use of vehicles, and direct mortality of individual animals) to wildlife species might result from surface-disturbing geophysical activities.

Locatable Minerals

The effects of locatable mineral resource development and production on wildlife could vary, depending on the location and degree of disturbance, the proximity to habitats, and the need to develop roads and other support facilities. Environmental contaminants associated with mining activities could affect wildlife species in many ways and at many levels within the ecosystem. Some contaminants (e.g., lead, arsenic, cyanide) associated with mines could cause acute or chronic effects on resident wildlife. Site-specific impacts to wildlife would be addressed in individual mining plans of operation. Under Alternative N, 169,480 acres would continue to be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to fish and wildlife species.

Salable Minerals

Alternative N would allow sale of mineral materials (salable minerals) on 1,668,300 acres (78% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted, so it is likely that additional impacts to fish and wildlife species would be minimal in these areas. New sites would

involve only small areas of land and would be subject to NEPA review. Effects on wildlife would be addressed on a case-by-case basis before sales were permitted.

Impacts from Special Designations

Wilderness Study Areas

Wilderness is important to the conservation of wildlife species that are prone to conflict with humans and vulnerable to human-caused mortality. Wilderness-dependent wildlife species are those vulnerable to human influence, whose continued existence is dependent on and reflective of wild, extensive, undisturbed habitat. Continued management of WSAs under the IMP would limit surface-disturbing actions that could adversely affect wildlife species. WSAs are closed to leasing, precluding any impact from oil and gas development on wildlife species within these areas, and are managed as VRM Class I, further restricting surface-disturbing activities. Species within the RFO that inhabit WSAs and benefit from the isolation and lack of disturbance afforded by these areas include bison and desert bighorn sheep.

Direction for managing wildlife in WSAs is prescribed by the IMP. The IMP allows the following: 1) stocking of native fish and wildlife species within their historical ranges, or exotics that were being stocked before October 21, 1976; and 2) introductions of threatened, endangered, or other SSS native to North America within their historical ranges. Permanent installations could be permitted, to maintain or improve conditions for wildlife and fish, if the benefiting native species enhance wilderness values. All proposed actions would need to be scrutinized to determine whether the action would be necessary to protect the physical, biological, and cultural resources, as well as the quality of the wilderness experience.

Wild and Scenic Rivers

Under Alternative N, the outstandingly remarkable values, tentative classification, and free-flowing nature of all eligible WSR segments would be protected. Fish and wildlife species would benefit from continuing these protections (which would protect riparian values) because no surface-disturbing activities would be allowed within the portions of their habitat located within these areas.

Areas of Critical Environmental Concern

The existing four ACECs would continue to be designated and managed to protect their relevant and important values under Alternative N. Management actions that restrict surface disturbances in North Caineville Mesa ACEC, South Caineville Mesa ACEC, and Gilbert Badlands ACEC would maintain existing forage and habitat composition and structure. In addition, protecting relict vegetation values in the North Caineville Mesa and South Caineville Mesa ACECs would indirectly maintain important areas for potential bird habitat. Managing Beaver Wash ACEC to protect the cold desert riparian ecosystem would protect important areas for wildlife feeding, breeding, and sheltering. This could result in a high degree of plant diversity along the riparian corridors, providing increased quality and quantity of forage for wildlife species.

Alternative A

Impacts from Soil Resources and Water Resources

Impacts would be similar to those under Alternative N. However, under Alternative A, soil and water resources would be managed to avoid surface-disturbing activities within 330 feet of streams, reducing or eliminating impacts to fish and wildlife species in these buffer zones. Thus, the area of protection from surface-disturbing activities would be reduced, compared to Alternative N.

Impacts from Vegetation

Vegetation Treatments

The types of impacts under Alternative A would be similar to those described under Alternative N. Vegetation treatments would be allowed under all alternatives, but the allowed methods would vary under each alternative. Large-scale vegetation management projects, such as sagebrush harrowing or juniper chaining, could impact fish and wildlife (or their habitats) in the sagebrush-steppe and pinyon-juniper woodlands vegetation type areas in which such treatments would be conducted. No vegetation treatments are proposed in the non-vegetated and desert shrub vegetation type areas.

Under Alternative A, an average of 73,600 acres of vegetation could be treated annually by using fire, mechanical, biological, manual, or chemical means. Depending on the timing, location, and project size, treatments could have adverse or beneficial impacts on wildlife habitat. These impacts would be determined by site-specific environmental analysis. For example, in mule deer summer range, reducing the pinyon-juniper component would promote favorable forage conditions. Conversely, reducing sagebrush habitat that provides cover and forage for the Greater sage-grouse would reduce forage availability and canopy cover, rendering the sage-grouse vulnerable to predation.

Management Activities in Riparian and Wetland Areas

Restoring riparian areas that are non-functioning or functioning at risk would improve the habitat quality or quantity for fish and wildlife species, by increasing vegetation species diversity, structure, and improving water quality. Soil, water, and riparian resources would be managed to achieve proper functioning condition, to avoid surface-disturbing activities within riparian and wetland habitat, and to provide buffer zones within 330 feet of streams, reducing or eliminating impacts to fish and wildlife species. In addition, goals to maintain or restore soil productivity, minimize accelerated soil erosion, and prevent flood or sediment damage would maintain or improve riparian-wetland habitat and water quality for fish and wildlife species. Closing and rehabilitating roads would have beneficial impacts to wildlife by reducing the potential for harassment and by providing additional habitat.

Invasive Species Management

The types of impacts experienced as a result of noxious weeds and invasive species management would be similar to those described under Alternative N. However, implementation of Alternative A would likely result in additional acres being managed for invasive and noxious weed control, compared with Alternative N. As a result, potential adverse short-term impacts to fish and wildlife could increase because of the additional areas to be treated. However, potential long-term benefits would also be greater as a result of weed control methods that would improve forage and habitat for fish and wildlife species. Habitat would also be improved by the removal of invasive and noxious weeds that compete for available space and resources.

Insect Pest Management

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced under Alternative A would be similar to those described under Alternative N, except that 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I under Alternative A. Fish and wildlife species whose habitat overlaps with these areas would benefit because VRM Class I areas (which require preservation of the existing landscape) would restrict surface-disturbing activities.

Under Alternative A, none of the lands managed by the RFO would be designated as VRM Class II; 392,800 acres (18%) would be designated as VRM Class III; and 1,288,300 acres (61%) would be managed as VRM Class IV. Areas designated as VRM Class III or IV (79% of the RFO under this alternative) would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) fish and wildlife habitat. Alternative A would designate more acres as VRM Class III or IV than would any of the other alternatives.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N except that stipulations imposed under Alternative A to protect Greater sage-grouse habitat would be less restrictive than those under Alternative N. Therefore, benefits to other wildlife species located in sage-grouse habitat would be less under Alternative A than Alternative N.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N, except that mitigation could be required in deer and elk habitats from December 15 through April 15 and in crucial desert bighorn habitat from April 15 through June 15. Implementation of these mitigation measures could also benefit other wildlife species located in these areas.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced under Alternative A would be similar to those described under Alternative N, except that under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually). Prescribed fires and wildland fires could adversely affect fish and wildlife species in the short term (for the reasons described under Alternative N). However, habitat manipulations through the use of fire could benefit fish and wildlife species over the long term, through improved vegetative conditions.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional protection for fish and wildlife.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N, except that commercial and non-commercial harvesting would be allowed throughout the RFO (with the exception of WSAs) under Alternative A. Thus, impacts to wildlife species from this type of activity would occur over a larger area.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N, except that 36,950 more acres would be available for grazing under Alternative A. Thus, impacts to fish and wildlife could occur over a larger area. However, because livestock grazing would be managed to meet the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, impacts to fish and wildlife should not be significant. Modifying and improving livestock grazing management to meet these Standards and Guidelines would improve rangeland conditions that could also benefit wildlife habitat.

Impacts from Recreation

The establishment of and management associated with SRMAs would provide for management at popular recreation use areas. Management of these areas under Alternative A would decrease the potential for inadvertent damage of fish and wildlife species and their habitat, as compared to management under Alternative N.

Under Alternative A, five SRMAs (514,500 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. This management would decrease the potential for impacts to fish and wildlife species. These impacts could include trampling, erosion, destruction of habitat, and the direct mortality of individual animals. Limiting OHV use in the Otter Creek Reservoir SRMA to designated routes would limit the extent of potential impacts.

The construction of recreation facilities in the Big Rock SRMA and the Sahara Sands SRMA would focus recreation use, minimizing impacts. Managing the Dirty Devil/Robbers Roost SRMA (290,000 acres) for primitive and semi-primitive recreation would reduce the potential for impacts to wildlife by limiting OHV recreation use to designated routes. Managing the Factory Butte SRMA (199,700 acres) for a motorized recreational opportunity and allowing moderate-to-extensive landscape modification could have major impacts and would result in continued impacts to wildlife. However, this area is receiving heavy motorized use currently.

Alternative A allows vehicles to pull off of designated routes (outside WSAs) as much as 100 feet to either side of centerline (for parking/staging) and as much as 300 feet to either side of centerline (for camping). This allowance could result in vehicles generally impacting wildlife species and their habitat in these areas.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N, except that implementation of Alternative A would result in 449,000 acres that are open to OHV use. OHV use has the potential to lead to direct mortality of individual animals as well as disruption of reproductive and foraging activities. The increasing use of OHVs on BLM land could also transport noxious and invasive weed seeds from infested areas to uninfested areas. Surface disturbance associated with OHV use (e.g., crushing of vegetation, soil disturbance) could increase the susceptibility of native plant communities to weed establishment and could modify soil conditions so that soils are unsuitable for establishment by native species.

Areas that would be closed to OHV use or in which OHV use would be restricted to designated routes would be protected from the surface-disturbing activities associated with OHV use. Alternative A, which would designate no areas as closed to OHV use and 1,679,000 acres as limited, would provide more protection to fish and wildlife species than would Alternative N because substantially fewer areas would be open to OHV use under Alternative A.

Alternative A proposes to limit OHV use to designated routes in crucial bison habitat and in Greater sage-grouse leks and nesting habitats. This designation would also benefit other wildlife species (including migratory birds) to the extent that these restricted areas overlap with bird breeding habitats. Proposed decisions for allowing motorized access to campsites adjacent to designated routes could impact migratory birds and their habitats. Disturbance of birds and alteration of habitat could be caused by campers, particularly in riparian areas that are often important bird habitat as well as desirable places to camp.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

The types of impacts experienced as a result of withdrawals would be similar to those described under Alternative N, except that fewer acres (154,700 acres) would be withdrawn from mineral entry under Alternative A. Thus, impacts to fish and wildlife species from mining-related surface-disturbing activities could be greater under this alternative.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of ROWs and other land use authorizations would be similar to those described under Alternative N, except that Alternative A would propose fewer ROW avoidance areas. Thus, impacts to fish and wildlife species from construction, operation, and maintenance of ROWs and other land use authorizations could be greater under Alternative A than under Alternative N.

Wind and Solar Energy

Implementation of Alternative A would allow wind and solar energy exploration and development throughout the RFO, except for in WSAs and VRM Class I areas. The restriction of wind and solar energy exploration and development within WSAs and VRM Class I areas could indirectly benefit fish and wildlife species by eliminating surface-disturbing activities within these areas.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative A, 57% of bighorn sheep habitat, 54% of bison habitat, 100% of elk habitat, 84% of mule deer habitat and 100% of pronghorn antelope habitat would be within areas open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) (Table 4-16 through Table 4-20). Consequently, these species would experience impacts from oil and gas development (particularly elk, mule deer, and pronghorn antelope because the majority of their habitat would be in these lease categories). Impacts would be the greatest under Alternative A. Other wildlife that occur within areas that are open to leasing subject to the standard terms and conditions or open to leasing standard to moderate constraints (TL, CSU) would also be adversely impacted by oil and gas development activities.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Geophysical

The type of impacts experienced as a result of geophysical exploration would be the same as those described under Alternative N, except that under Alternative A, geophysical explorations would be allowed throughout the RFO (with the exception of WSAs), as determined through site-specific NEPA analysis. Alternative A could therefore result in more potential impacts to fish and wildlife species than would Alternative N.

Locatable Minerals

The types of impacts experienced as a result of locatable minerals activities would be the same as those described under Alternative N. Under Alternative A, 154,700 acres would continue to be withdrawn from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these

types of activities could cause to fish and wildlife species. Alternative A would recommend the fewest acres for mineral withdrawal and therefore could result in the most potential impacts.

Salable Minerals

The type of impacts experienced from the disposal of salable minerals would be the same as those described under Alternative N. Alternative A would allow sale of mineral materials (salable minerals) on 1,681,100 acres (79% of the RFO). Existing areas of salable mineral disposals have already been substantially impacted, so it is likely that impacts to fish and wildlife species would be minimal in these areas. However, new sites would involve only small areas of land and would be subject to NEPA review. Effects on wildlife would be addressed on a case-by-case basis before sales were permitted.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible rivers would be recommended or managed as suitable. The outstandingly remarkable values, tentative classification, and free-flowing nature of these river segments would not be protected. Thus, fish and wildlife species would not receive any additional benefit.

Areas of Critical Environmental Concern

Under Alternative A, no ACECs would be designated. No special management to protect relevant and important values would be provided to fish and wildlife species or their habitat.

Proposed RMP

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation

Vegetation Treatments

Impacts would be the same as those described under Alternative A.

Management Activities in Riparian and Wetland Areas

Impacts would be the same as those described under Alternative A.

Invasive Species Management

Impacts would be the same as those described under Alternative A.

Insect Pest Management

The types of impacts experienced as a result of insect pest management would be similar to those described under Alternative N, except that implementation of the Proposed RMP would allow for pest control treatments when the area's economic threshold is exceeded. This action would likely be implemented only during large insect outbreaks, such as outbreaks of grasshoppers or Mormon crickets. The use of insecticides during large outbreaks could benefit wildlife species by reducing competition for available food. However, adverse impacts would also be realized in the form of decreased plant pollinators and reduced forage base.

Impacts from Visual Resources

The types of impacts experienced under the Proposed RMP would be similar to those described under Alternative A, except that more acres would be designated as VRM Classes I and II (655,900 acres, or 31% of the RFO), thereby protecting fish and wildlife species by restricting ground-disturbing activities in these areas.

Under the Proposed RMP, 393,100 acres (18%) would be designated as VRM Class III and 1,038,200 (49%) would be managed as VRM Class IV. These areas, which could allow for greater landscape modification and therefore greater surface disturbance, could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the habitat for fish and wildlife. The Proposed RMP would designate more acres as VRM Classes III and IV than would Alternative C or D but fewer acres than would Alternative N or A.

Impacts from Special Status Species

Generally, impacts would be the same as those described under Alternative N. However, the Proposed RMP would allow NSO within ½ mile of Greater sage-grouse leks and would prohibit surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14 (see Appendix 11 for exceptions, waivers, and modifications). These stipulations would benefit other wildlife species that occur within the restricted areas. Therefore, wildlife benefits under the Proposed RMP would be greater than under Alternatives N or A, but less than Alternatives C and D.

Impacts from Fish and Wildlife

Proposed actions such as habitat manipulations and range developments could result in short-term, adverse impacts to fish and wildlife and could detrimentally influence their behavior. Short-term, adverse impacts could result from vegetation treatments that require the use of heavy equipment. Human disturbance and noise associated with the use of heavy equipment could temporarily disperse wildlife from occupied habitats. Adverse direct impacts could also result from accidental chemical drift from pesticide use in nearby areas. These activities have the potential to remove suitable habitat or other desired vegetation for wildlife species. Vegetation treatments would likely benefit wildlife species and their prey over the long term, by providing additional forage.

Implementation of the Proposed RMP would result in seasonal and spatial stipulations to protect desert bighorn sheep habitats during lambing and other sensitive times during their lifecycles. However, exceptions, waivers, or modifications could be granted on a case-by-case basis. Protective stipulations placed on crucial habitats would reduce adverse effects that surface-disturbing activities could cause to these species, as well as to other wildlife species that occupy the same areas.

Surface-disturbing activities could contribute to decreased air quality and increased soil erosion, soil compaction, introduction and spread of invasive and noxious weeds, crushing of plants, and habitat degradation. Restrictions or stipulations of surface-disturbing activities within wildlife habitats would also benefit other wildlife species that occur within the restricted areas. The Proposed RMP would prohibit surface-disturbing activities in deer and elk habitat from December 1 through April 15, and in crucial desert bighorn habitat from April 15 through June 15. Mitigation measures would be required for pronghorn antelope from May 15 through June 15. Implementation of these restrictions and stipulations would directly benefit other species by precluding surface-disturbing activities during reproductive periods, and would indirectly benefit wildlife located in these areas by limiting habitat disturbance.

Impacts from Wild Horses and Burros

The types of impacts experienced as a result of wild horse and burro management would be similar to those described under Alternative N, except that the Proposed RMP proposes to manage the Canyonlands HMA for 60–100 wild burros. New burros could be introduced to maintain genetic variability. Activities under the Proposed RMP, including the introduction and gathering of wild burros, could adversely affect wildlife species, as described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced under the Proposed RMP would be similar to those described under Alternative N, except that the Proposed RMP would include stabilization efforts to sustain ecosystems, improve public health, improve safety, and help communities protect infrastructure. Priority would be given to areas that pose a threat to life and property and areas with a potential for invasive weeds. As previously discussed, stabilization efforts would have the potential to benefit fish and wildlife species through decreased erosion and improved habitat and vegetation conditions, but would also result in short-term impacts that would alter habitat.

Impacts from Non-WSA Lands with Wilderness Characteristics

Managing 78,600 acres of non-WSA lands with wilderness characteristics to maintain their wilderness characteristics would provide habitat for wildlife species vulnerable to human influence, whose continued existence is dependent on and reflective of wild, extensive, undisturbed habitat. Management actions for non-WSA lands with wilderness characteristics would reduce surface disturbance and habitat fragmentation. Species within the RFO that benefit from the isolation and lack of disturbance afforded by these areas include bison and desert bighorn sheep.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N, except that commercial and non-commercial harvesting would be allowed throughout the RFO (with the exception of WSAs and the one suitable WSR corridor proposed under the Proposed RMP). Thus, impacts from this type of activity would occur over a larger area than under Alternative N but a smaller area than under Alternative A.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A, except that the Proposed RMP would establish five SRMAs (860,390 acres) to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. The Proposed RMP proposes only 24,400 acres at Factory Butte and 90 acres at Big Rocks as OHV SRMAs, decreasing the potential for impacts to wildlife, as compared to Alternative A.

The Proposed RMP would allow vehicles to pull off of designated routes (outside WSAs) as much as 50 feet to either side of the centerline (for parking/staging) and as much as 150 feet to either side of the centerline (for camping). Although this could result in vehicles impacting wildlife species, the area of potential impact would be localized and would be less than under either Alternative N or A.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N, except that implementation of the Proposed RMP would result in 9,890 acres that are open to cross-country OHV use. OHV use could be more concentrated in this smaller area, and would likely have more adverse effects per acre. Impacts of OHV use on wildlife could involve habitat disturbance, as well as disturbance to individual animals during reproductive or foraging activities. The increasing use of OHVs on BLM land could also transport noxious and invasive weed seeds from infested areas to uninfested areas. Surface disturbance associated with OHV use (e.g., crushing of vegetation and soil disturbance) could increase the susceptibility of native plant communities to weed establishment and could modify soil conditions so that soils are unsuitable for establishment by native species.

Areas that are closed to OHV use or in which the use is restricted to designated routes would be protected from the surface-disturbing activities associated with OHV use. The Proposed RMP, which designates 209,900 acres as closed to OHV use and 1,908,210 acres as limited, would provide more protection to fish and wildlife species than would either Alternative N or A because substantially fewer areas are open to OHV use under the Proposed RMP.

Under the Proposed RMP, 4,277 miles of routes would be designated for use by the public, and 345 miles would be closed. The Proposed RMP designates routes to minimize harassment or significant disruption of wildlife. Limited or no access would reduce adverse effects that OHV use could cause to fish and wildlife species.

The Proposed RMP proposes the following travel restrictions in wildlife habitat areas: limit OHV use to designated routes on 806,700 acres and close 4,500 acres to OHV use within deer and elk crucial winter range; and limit OHV use to designated routes in crucial bison habitat and in all Greater sage-grouse habitats including breeding (leks), nesting, brood-rearing and wintering habitat. These limitations would also benefit other wildlife species (including migratory birds) to the extent that the restricted areas overlap with bird breeding habitat. Proposed decisions for allowing motorized access to campsites adjacent to designated routes could impact migratory birds and their habitats because of disturbance of birds and alteration of habitat by campers, particularly in riparian areas that are often important bird habitat and desirable places to camp.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Implementation of the Proposed RMP would include recommending for mineral withdrawals two ACECs (2,530 acres), one suitable WSR segment (5 miles), and developed recreation sites. Withdrawing these areas from mineral entry would reduce any adverse impacts to fish and wildlife species that could result from mineral developments in these areas.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that fewer ROW avoidance areas would be proposed under the Proposed RMP. Because site-specific NEPA review would be required, impacts to fish and wildlife species would be minimized or mitigated.

Wind and Solar Energy

Implementation of the Proposed RMP would result in the potential for wind and solar energy exploration and development in the majority of the RFO, with the exception of WSAs, ACECs, areas managed as open to leasing subject to major constraints (NSO) for oil and gas development, and VRM Class I or II areas. The restriction on wind and solar development within these areas would likely benefit bird species, including migratory species, by providing sites in which conflicts between birds and wind and solar facilities would be avoided.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, 38% of bighorn sheep habitat, 46% of bison habitat, 99% of elk habitat, 87% of mule deer habitat, and 98% of pronghorn antelope habitat would be within areas open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) (Table 4-16 through Table 4-20). Consequently, these species (particularly elk, mule deer, and pronghorn antelope because the majority of their habitat would be in these lease categories) would experience impacts from oil and gas development. However, impacts would be slightly less than under Alternative N. Other wildlife that occur within areas that are open to leasing or open to leasing subject to moderate constraints (TL, CSU) would also be adversely impacted by oil and gas development activities.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Geophysical

The type of impacts experienced as a result of geophysical exploration would be the same as those described under Alternative N, except that under the Proposed RMP, geophysical explorations would be allowed throughout the RFO with the exception of WSAs, suitable WSR corridors (1 segment–5 miles), and ACECs (2,530 acres), as determined through site-specific NEPA analysis. The Proposed RMP therefore could result in more impacts to wildlife than would Alternative N, C, or D but fewer impacts than would Alternative A.

Locatable Minerals

The types of impacts experienced as a result of minerals and energy would be similar to those described under Alternative N. Under the Proposed RMP, 176,200 acres would be recommended for withdrawal from mineral entry. Closing or withdrawing areas from mineral operations would prevent impacts that these types of activities could cause to fish and wildlife species. The Proposed RMP would recommend fewer acres for mineral withdrawal than would Alternative C or D but more acres than would Alternative N or A.

Salable Minerals

The type of impacts experienced from the disposal of salable minerals would be the same as those described under Alternative N. The Proposed RMP allows sale of mineral materials (salable minerals) on 1,680,700 acres (79% of the RFO). However, new sites would involve only small areas of land and would be subject to NEPA review. Effects on wildlife would be addressed on a case-by-case basis before sales were permitted, and potential impacts would be mitigated.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under the Proposed RMP, one river segment with a tentative classification of Wild (the Fremont River in Fremont Gorge—5 total miles) would be recommended as suitable for WSR designation. Managing this area as suitable for inclusion in the NWSRS would benefit species such as migratory birds that use these areas, by protecting riparian values and ecological condition. A lack of potential for surface-disturbing activities would also result in the protection of habitat used by the prey of wildlife species.

Areas of Critical Environmental Concern

Under the Proposed RMP, two ACECs would be designated: North Caineville Mesa (2,200 acres) and Old Woman Front RNA (330 acres). The ACECs would provide protection for fish and wildlife species, by restricting many surface-disturbing activities. Special management of these ACECs would include closing to OHV use, managing as ROW avoidance areas, managing oil and gas leasing as open with NSO, unavailable for livestock grazing, and closed to harvesting of woodland products (Old Woman Front) These management prescriptions to protect relevant and important values would also protect the fish and wildlife species that occur in the ACECs. However, the total acreage contained within these ACECs (2,530 acres) is nominal, so designation of these areas would provide little additional protection to wildlife.

Alternative C

Impacts for Soil Resources and Water Resources

Impacts would be similar to those under Alternative N. However, under Alternative C, soil and water resources would be managed to avoid surface-disturbing activities within 660 feet of streams, reducing or eliminating impacts to fish and wildlife species in these buffer zones. Thus, the area of protection from surface-disturbing activities would be increased, compared to Alternative N. Alternative C (along with Alternative D) would best protect habitat for riparian-obligate species, provide and protect clean water sources for big game, protect aquatic invertebrates, and protect and promote riparian vegetation, which would provide habitat for songbirds. Closing and rehabilitating roads would have beneficial impacts to wildlife, by reducing the potential for harassment and by providing additional habitat.

Impacts from Vegetation

Vegetation Treatments

Impacts would be similar to those described under Alternative N. Under Alternative C, an average of 26,000 acres annually could be treated by using only prescribed or wildland fire and biological treatments. Depending on the timing, location, and project size, treatments could have adverse or beneficial impacts on wildlife habitat, as determined by site-specific environmental analysis. For example, in mule deer summer range, reducing the pinyon-juniper component would promote favorable forage conditions. Conversely, reducing sagebrush habitat that provides cover and forage for the Greater sage-grouse would reduce forage availability and canopy cover, rendering the sage-grouse vulnerable to predation. The limitation on treatment methods under Alternative C could preclude effective vegetation management for wildlife in some areas.

Management Activities in Riparian and Wetland Areas

The types of impacts experienced as a result of riparian management would be similar to those described under Alternative N, except that the size of the buffer zone in which no surface disturbance would be allowed would be 660 feet to each side of the riparian area under Alternative C (compared with 500 feet under Alternative N). Thus, Alternative C would protect a larger area around the riparian/wetland zones from surface-disturbing activities. This larger area would protect habitat for riparian-obligate species,

provide and protect clean water sources for big game, protect aquatic invertebrates, and protect and promote riparian vegetation, which would provide habitat for songbirds.

Invasive Species Management

The types of impacts experienced as a result of noxious weeds and invasive species management would be similar to those described under Alternative N, except that implementation of Alternative C would initiate an attempt to control noxious and invasive weeds through treatment methods that mimic natural processes. Implementation of Alternative C could make control of some invasive species difficult because of lack of suitable substitute treatments possibly allowing the spread of invasive species and displacement of desirable vegetation (Hart 1999). For example, using fire as a control tool for species such as tamarisk could increase the growth and spread of non-native, fire-adapted species that have more efficient recovery mechanisms than most native species. This growth could have indirect adverse effects on fish and wildlife species because noxious and invasive weeds would likely expand their range and could alter suitable fish and wildlife habitat and reduce available forage. The short-term adverse effects resulting from surface-disturbing activities (and discussed under Alternative A) would not be realized. Beneficial impacts resulting from weed control treatments through natural processes within fish and wildlife habitat would be limited.

Insect Pest Management

The types of impacts experienced as a result of insect pest management would be similar to those described under Alternative N, except that implementation of Alternative C would result in no immediate beneficial or adverse impacts from pest control treatments. However, wildlife species could be affected if insect pests proliferate to the point of changing the landscape/habitat by removing large amounts of potential forage.

Impacts from Visual Resources

The types of impacts experienced under Alternative C would be similar to those described under the Proposed RMP. However, Alternative C would designate more acres as VRM Classes I and II (677,500 acres, or 32% of the RFO), thus protecting fish and wildlife species by restricting ground-disturbing activities in these areas.

Under Alternative C, 509,100 acres (24%) would be designated as VRM Class III and 941,400 (44%) would be managed as VRM Class IV. These areas, which would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance, could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short-term) the habitat for fish and wildlife species. Alternative C would designate more acres as VRM Classes III and IV than would Alternative D but fewer acres than would Alternative N or A or the Proposed RMP.

Impacts from Special Status Species

Impacts would be similar as those described under the Proposed RMP. Although Alternative C does not include timing limitations on surface disturbing activities in sage grouse winter habitat, this habitat is mostly within crucial mule deer habitat which does have a timing limitation on such activities from December 15 through April 15.

Impacts from Fish and Wildlife

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under the Proposed RMP, except that Alternative C would implement seasonal and spatial stipulations to protect desert bighorn sheep habitats during lambing and other sensitive times during their lifecycles. Stipulations placed on crucial habitat management would reduce adverse effects caused by

surface-disturbing activities that could harm those species, as well as other species that occur within the same area.

Restrictions or stipulations of surface-disturbing activities within wildlife habitats would also benefit other wildlife species that occur within the restricted areas. Alternative C prohibits surface-disturbing activities in deer and elk habitat from December 1 through April 15, in crucial desert bighorn habitat from April 15 through June 15, and in crucial pronghorn antelope habitat from May 15 through June 15. Implementation of these restrictions and stipulations would directly benefit other species by precluding surface-disturbing activities during reproductive periods, as well as indirectly benefiting wildlife located in these areas by limiting habitat disturbance.

Impacts from Wild Horses and Burros

The types of impacts experienced as a result of wild horse and burro management would be similar to those described under Alternative N, except that Alternative C proposes to manage the Canyonlands HMA for 120-200 wild burros. New burros could be introduced to maintain genetic variability. Activities under this alternative, including the introduction and gathering of wild burros, would have the potential to adversely affect wildlife species as described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced under this alternative would be similar to those described for the Proposed RMP, except that under Alternative C the average annual treatment limits would be less (26,000 acres). As stated previously, prescribed fires and wildland fires have the potential to adversely affect wildlife species. However, habitat manipulations with the use of fire could benefit wildlife over the long-term through improved vegetative conditions. With less acres treated under this alternative, there would be less potential adverse impacts, but also less potential beneficial impacts from habitat manipulations.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional protection for fish and wildlife.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N, except that commercial and non-commercial harvesting would be allowed throughout the RFO (with the exception of WSAs and suitable WSR corridors). Thus, impacts from this type of activity would occur over a smaller area than Alternatives A or the Proposed RMP. In addition, the rejuvenating benefits to habitats from the clearing of woodland areas would not be realized in the areas in which forest and woodland products harvesting is precluded.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N, except that this alternative prohibits a change in kind of livestock from cattle to domestic sheep within all identified bighorn sheep habitat. Because domestic sheep can transmit diseases to bighorn sheep, this would provide protections for bighorn sheep within the RFO from livestock.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative A, except that four SRMAs (930,000 acres) would be established to manage recreational use and to mitigate impacts caused by this use. No SRMAs would be established for OHV use under Alternative C, thereby decreasing the potential for impacts from this type of use to fish and wildlife species.

Managing the Dirty Devil/Robbers Roost SRMA (375,800 acres) for dispersed recreation in a primitive setting would indirectly reduce the potential for surface disturbance (and associated damage to fish and wildlife) caused by recreation. Managing the Henry Mountains SRMA (533,900 acres) for primitive and semi-primitive recreation and managing the Sevier Canyon SRMA (7,500 acres) for scenic values would indirectly maintain or reduce the potential for disturbance and impacts to fish and wildlife. Managing the Capitol Reef Gateway SRMA (12,800 acres) for a natural recreation experience and the development of facilities could have localized site-specific impacts, although NEPA review would be required prior to construction of any facilities.

Alternative C allows vehicles to pull off of designated routes (outside WSAs) as much as 25 feet to either side of the centerline (for parking/staging); camping would be allowed only in designated campsites, with travel between campsites allowed only on designated routes. Together, these restrictions would minimize disturbance to fish and wildlife species and would result in less disturbance than under Alternative N or A or the Proposed RMP.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N, except that under Alternative C, no acres would be open to cross-country OHV use; 1,445,000 acres would be limited to designated routes; and 683,000 acres would be closed to OHV use. By eliminating areas that are open to unrestricted OHV use, adverse impacts to fish and wildlife species would be substantially reduced.

Under Alternative C, there would be 3,192 miles of designated routes and 1,188 miles of routes that would be closed. Alternative C designates routes to minimize harassment or significant disruption of wildlife. Limited or closed areas would reduce adverse effects that OHV use could have on fish and wildlife species.

Alternative C proposes the following travel restrictions in wildlife habitat areas: Within deer and elk crucial winter range, limit OHV use to designated routes on 509,000 acres and close 142,000 acres to OHV use; within crucial bison habitat, limit OHV use to designated routes on 62,000 acres and close 189,000 acres to OHV use; and limit OHV use to designated routes in all Greater sage-grouse habitats including breeding (leks), nesting, brood-rearing and wintering habitat. These restrictions would also benefit other wildlife species (including migratory birds), to the extent that the restricted areas overlap with bird breeding habitat. Proposed decisions for allowing motorized access to campsites adjacent to designated routes could impact migratory birds and their habitats because of disturbance of birds and alteration of habitat by campers, particularly in riparian areas that are often important bird habitat and desirable places to camp.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Alternative C recommends withdrawing from mineral entry all or parts of several ACECs, suitable WSR corridors, and developed recreation sites (331,100 acres, or 16% of the RFO). Withdrawing these areas from mineral entry would reduce adverse impacts that mineral developments could have on fish and wildlife species in these areas.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance areas are proposed under Alternative C (735,000 acres closed to leasing or open to leasing subject to major constraints (NSO), 12 suitable WSR segments, and 16 ACECs). Because NEPA review would be required prior to issuing any land use authorization, impacts to fish and wildlife species would be minimal.

Wind and Solar Energy

Alternative C specifically excludes SSS habitats from wind and solar energy developments. This exclusion would help to protect other wildlife species (including bats, migratory birds, and raptors) that occur in these areas from any surface-disturbing action that could result from these developments.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative C, 33% of bighorn sheep habitat, 34% of bison habitat, 95% of elk habitat, 73% of mule deer habitat, and 100% of pronghorn antelope habitat are within areas open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) (Table 4-16 through Table 4-20). Consequently, these species (particularly elk and pronghorn antelope because almost all of their habitat would be in these lease categories) would experience impacts from oil and gas development, although the impacts would be less than under Alternative N or A or the Proposed RMP. Other wildlife that occurs within areas that are open to leasing or open to leasing subject to moderate constraints (TL, CSU) could also be adversely impacted by oil and gas development activities.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Geophysical

The type of impacts experienced as a result of geophysical exploration would be the same as those described under Alternative N, except that under Alternative C, geophysical explorations would be allowed throughout the RFO, with the exception of WSAs, suitable WSR corridors (12 segments—135 miles), and ACECs (886,810 acres), as determined through site-specific NEPA analysis. Alternative C could result in more potential impacts to wildlife species than Alternative D but less impacts than Alternative N or A or the Proposed RMP.

Locatable Minerals

The types of impacts that would be experienced from locatable mineral activities would be the same as those described under Alternative N. Under Alternative C, the location, exploration, and development of locatable minerals could occur throughout the RFO, except in areas withdrawn from mineral entry (331,100 acres), including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, Koosharem Picnic Area, Dirty Devil ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, Little Rockies ACEC, Rainbow Hills ACEC, and suitable WSR corridors. Wildlife species located in the withdrawn areas would be protected from surface-disturbing activities that could result from locatable minerals activities.

Salable Minerals

The type of impacts experienced from the disposal of salable minerals would be the same as those described under Alternative N. Alternative C allows sale of mineral materials (salable minerals) on 1,541,700 acres (72% of the RFO). However, new sites would involve only small areas of land and would be subject to NEPA review. Effects on wildlife would be addressed on a case-by-case basis before sales were permitted, and potential impacts would be mitigated.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative C, the Dirty Devil River, Beaver Wash Canyon, Larry Canyon, No Man's Canyon, Robbers Roost Canyon, Sams Mesa Box Canyon, Twin Corral Box Canyon, Fish Creek, Maidenwater Creek, Quitchupah Creek, and the Fremont River in Fremont Gorge and below Capitol Reef National Park to the Caineville ditch diversion would be designated as suitable WSRs. Management to protect their outstandingly remarkable values, tentative classification, and free-flowing nature would benefit species such as migratory birds that use these areas. (Management could include closing the areas to OHV us, closing the areas to leasing, and withdrawing the areas from mineral entry.) A lack of potential for surface-disturbing activities would also result in the protection of habitat used by the prey of wildlife species.

Areas of Critical Environmental Concern

Under Alternative C, 16 areas (886,810 acres) would be designated as ACECs: Badlands, Bull Creek, Dirty Devil, Fremont Gorge/Cockscomb, Henry Mountains, Horseshoe Canyon, Kingston Canyon, Little Rockies, Lower Muddy Creek, Old Woman Front, Parker Mountain, Quitchupah, Rainbow Hills, Sevier Canyon, Thousand Lakes Bench, and SSS ACECs. ACECs provide protection for fish and wildlife by restricting many surface-disturbing activities, including mineral leasing, OHV use, wood cutting, new ROWs, or motorized camping. Those ACECs with relevant and important values related to fish and wildlife resource values and associated habitat would have special management to protect these resources, indirectly resulting in additional protection for big game species and Greater sage-grouse and associated habitat. In some areas, notably the Henry Mountains, vegetation manipulation projects could cause short-term adverse impacts to bird habitat. These effects would be mitigated in the long term by anticipated improvement in vegetation health and vigor.

Alternative D

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative C.

Impacts from Vegetation

Vegetation Treatments

Impacts would be the same as those described under Alternative C.

Management Activities in Riparian and Wetland Areas

Impacts would be the same as those described under Alternative C.

Invasive Species Management

Impacts would be the same as those described under Alternative C.

Insect Pest Management

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

The types of impacts would be the same as described under Alternative C, except that Alternative D would designate more acres as VRM Classes I and II (1,196,300 acres, or 56% of the RFO), protecting fish and wildlife species by restricting ground-disturbing activities in these areas.

Under Alternative D, 355,100 acres (17%) would be designated as VRM Class III and 576,600 (27%) would be managed as VRM Class IV. These areas, which would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance, could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the habitat for fish and wildlife species. This alternative designates far fewer acres as VRM Classes III and IV than any other alternative, so impacts to fish and wildlife would be the least of all alternatives because of VRM class designations.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative C.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Protecting the non-WSA lands with wilderness characteristics would provide habitat for wildlife species that are vulnerable to human influence and whose continued existence is dependent on and reflective of wild, extensive, undisturbed habitat. Management actions for non-WSA lands with wilderness characteristics would reduce surface disturbance and habitat fragmentation. Species within the RFO that benefit from the isolation and lack of disturbance afforded by these areas include bison and desert bighorn sheep.

Impacts from Forestry and Woodland Products

The types of impacts experienced as a result of forest and woodland products harvesting would be similar to those described under Alternative N. However, under Alternative D, commercial and non-commercial harvesting would not be allowed in WSAs, suitable WSR corridors, and non-WSA lands with wilderness characteristics. Thus, impacts from this type of activity would occur over a much smaller area than under any other alternative, potentially providing the greatest benefit to fish and wildlife species. However, the rejuvenating benefits that the clearing of woodland areas would have on habitats would not be realized.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative C.

Impacts from Recreation

The types of impacts experienced as a result of recreation management would be similar to those described under Alternative C, except that Alternative D would establish seven SRMAs (1,358,100 acres) to manage recreational use and to mitigate impacts caused by this use. No SRMAs would be established for OHV use, thus decreasing the potential for impacts that this type of use could have on fish and wildlife species. As described under Alternative C, the development of facilities could have localized, site-specific impacts, although NEPA review would occur prior to construction of any facilities, thus mitigating and minimizing impacts to wildlife.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, under Alternative D, no acres would be open to cross-country OHV use; OHV use on 972,800 acres would be limited to designated routes; and 1,155,200 acres would be closed to OHV use. Of all the alternatives, Alternative D would have the least potential impacts that OHV use could cause to fish and wildlife species.

Under Alternative D, there would be 3,043 miles of designated routes, and 1,242 miles that would be closed. Reducing access would reduce adverse effects that OHV use could cause to fish and wildlife species. Route designations would cause the fewest impacts to fish and wildlife under this alternative.

Alternative D proposes the following travel restrictions in wildlife habitat areas: Within deer and elk crucial winter range, limit OHV use to designated routes on 393,000 acres and close 258,000 acres to OHV use; within crucial bison habitat, limit OHV use to designated routes on 44,000 acres and close 207,000 acres to OHV use; and limit OHV use to designated routes in all Greater sage-grouse habitats including breeding (leks), nesting, brood-rearing and wintering habitat. These restrictions would also benefit other wildlife species (including migratory birds) to the extent that the restricted areas overlap with bird breeding habitat. Proposed decisions for limiting motorized camping to designated campsites (and thereby limiting motorized access) would minimize impacts to migratory birds and their habitats because campsites would be designated only where compatible with other resources. Of all the alternatives, Alternative D would provide the most protection from impacts related to motorized travel.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be the same as those described under Alternative N.

Withdrawals

Alternative D would recommend withdrawing from mineral entry all non-WSA lands with wilderness characteristics, all or parts of several ACECs, suitable WSR corridors, and developed recreation sites (903,900 acres, or 42% of the RFO)—the most under any of the alternatives. Withdrawing these areas from mineral entry would reduce adverse impacts that mineral developments could cause to fish and wildlife species in these areas. More than any other alternative, Alternative D would reduce potential impacts caused by mining activity.

Rights-of-Way and Other Land Use Authorizations

The types of impacts experienced as a result of land use authorizations would be similar to those described under Alternative N, except that more ROW avoidance areas are proposed under Alternative D (1,203,800 acres closed to oil and gas leasing or open with NSO, 12 suitable WSR segments, and 16 ACECs). Because NEPA review would be required prior to issuing any land use authorization, impacts to fish and wildlife would be minimized.

Wind and Solar Energy

Impacts would be the same as those described under Alternative C.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative D, 2% of bighorn sheep habitat, 12% of bison habitat, 81% of elk habitat, 53% of mule deer habitat, and 100% of pronghorn antelope habitat would be within areas that would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) (Table 4-16 through Table 4-20). Consequently, these species (particularly elk, mule deer, and pronghorn antelope because the majority of their habitat would be in these lease categories) would experience impacts caused by oil and gas development, although the impacts would be significantly less for most of these species than under any of the other alternatives. Other wildlife that occurs within areas that are open to leasing or open to leasing subject to moderate constraints (TL, CSU) could also be adversely impacted by oil and gas development activities. Of all the alternatives, Alternative D would have the least potential impacts caused by oil and gas development to fish and wildlife.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Geophysical

Under Alternative D, BLM would allow geophysical explorations outside of WSAs, non-WSA lands with wilderness characteristics, WSR corridors, and ACECs as determined through site-specific NEPA analysis. Potential impacts that geophysical exploration could cause to fish and wildlife species would be least under this alternative because the least amount of land would be available for this type of activity.

Locatable Minerals

The types of impacts caused by locatable mineral activities would be the same as those described under Alternative N. However, under Alternative D, the location, exploration, and development of locatable minerals could occur throughout the RFO, except in areas withdrawn from mineral entry (903,900 acres), including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, Koosharem Picnic Area, Dirty Devil ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, Little Rockies ACEC, Rainbow Hills ACEC, and suitable WSR corridors and non-WSA lands with wilderness characteristics. Fish and wildlife species in the withdrawn areas would be protected from surface-disturbing activities that could result from locatable minerals activities. Of all the alternatives, Alternative D would have the least potential impacts caused by locatable mineral development.

Salable Minerals

With the implementation of Alternative D, 1,160,500 acres (WSAs, non-WSA lands with wilderness characteristics, Dirty Devil ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, Little Rockies ACEC, Rainbow Hills ACEC, and within one-quarter mile of the high water mark on each bank of the river segment of suitable WSRs) would be closed to disposal of salable minerals. The exclusion of these areas from surface-disturbing mineral materials activities would indirectly benefit fish and wildlife species within these areas. The disposal of mineral materials on other public lands would be allowed on a case-by-case basis. Of all the alternatives, Alternative D would have the least potential impact caused by mineral material sales to fish and wildlife species.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.3.10 Wild Horses and Burros

The goal of the Wild and Free-Roaming Horse and Burro Act is to manage wild horses and burros "in the area where presently [1971] found as an integral part of the natural system of the public lands." The Act and subsequent regulations direct that wild horses and burros be managed to ensure a thriving natural ecological balance with the minimum feasible management required to maintain the populations. Managing wild horse and burro populations at a sufficient size to be genetically viable is important to accomplish this goal. Some management decisions could impact the viability of wild horse or burro populations. Populations that would require long-term, intensive management would not comply with the minimum feasible management regulations and would therefore be noted as an impact.

Methods and Assumptions

Impact analyses and conclusions are based on interdisciplinary team knowledge of resources in the RFO, review of existing literature, and information provided by other agencies. Effects are quantified when possible. Spatial analyses were conducted by using GIS data and analyses. Impacts are described using ranges of potential impacts or in qualitative terms, if appropriate.

Environmental Consequences

Impacts to wild horses and burros would likely result from actions proposed under the following resource management programs:

- Soil Resources and Water Resources
- Special Status Species
- Wild Horses and Burros
- Non-WSA Lands with Wilderness Characteristics
- Livestock Grazing
- Recreation
- Travel Management
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on wild horses and burros. There are no WSR decisions that would impact wild and horse burro resources.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

Reducing surface disturbance and erosion would help maintain and improve the quality and quantity of forage available for burros in the Canyonlands HMA. Reduction would be achieved through the application of BMPs such as reclaiming disturbed areas, minimizing the amount of access roads, requiring weed-free feed to reduce the potential for spread of noxious weeds, and others, as listed in Appendix 14.

Impacts from Special Status Species

Actions to preserve SSS could maintain forage resources, but some habitats or specific populations of SSS might be fenced or otherwise protected. In comparison to the HMA acreages, the impacts to these areas would not be significant if the fenced area was not a water source. Within this desert environment, fencing that excluded the burros from water could result in moderate-to-major impacts, depending on the number and locations of water sources involved.

Impacts from Wild Horses and Burros

The preliminary wild burro AML in the Canyonlands HMA would serve to maintain a population of wild burros within the genetically viable range. Although forage would not specifically be allocated to the wild burros, sufficient forage would be available for the AML, so no impacts would exist.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for wild horses and burros.

Impacts from Livestock Grazing

Because forage would not be allocated to livestock on the northeastern portions of the Canyonlands HMA, livestock grazing would cause no impact to wild burros in these areas. In the remainder of the Canyonlands HMA, competition for habitat resources (specifically forage and water) could continue between livestock and wild horses and burros. In the long term, this competition could change the distribution patterns or reproductive success of the wild burros in these areas. Impacts would be mitigated through monitoring and adjustments in forage use.

Impacts from Recreation

No developments, facilities, or SRMAs would be proposed within the Canyonlands HMA. Therefore, there would be no impact on wild horses and burros from these types of developments or management. Recreation use in the remote area of the Canyonlands HMA has increased, and that trend is expected to continue. In the long term, unstructured recreation use in this area could result in adverse impacts to the burros because of harassment by visitors, passage of motorized vehicles, and use of natural water sources.

Impacts from Travel Management

In the Canyonlands HMA, OHV use would be limited to existing routes on more than 50% of the HMA. The remaining acreage would mostly be open to cross-country OHV use, with a small southwest portion of the HMA (where the Dirty Devil WSA overlaps the HMA) closed to OHV use. The presence of OHV recreation users on 45 miles of designated routes in the HMA could temporarily displace wild burros from the proximity of riders. On those portions of the Canyonlands HMA that would be open to cross-country OHV use, vegetation loss resulting from cross-country travel could reduce available forage for wild horses and burros. Given the size of the HMA, the limited number of routes, and the amount of anticipated use, the wild and free-roaming nature of the herd would not likely be eliminated.

Impacts from Minerals and Energy

The Canyonlands HMA is located within lands predicted to have a low development potential for oil and gas. Impacts to burros would therefore be unlikely. More than 50% of the HMA overlaps portions of the Horseshoe Canyon North, Horseshoe Canyon South, French Spring/Happy Canyon, and Dirty Devil WSAs. These areas are managed according to the IMP and are closed to leasing, prohibiting the leasing of non-energy solid minerals and disposal of mineral materials. Therefore, the potential for mineral and energy development to impact burros is minimal.

Impacts from Special Designations

Wilderness Study Areas

Managing the Horseshoe Canyon North, Horseshoe Canyon South, French Spring/Happy Canyon, and Dirty Devil WSAs according to the IMP would preclude most surface-disturbing activities in these areas. Portions of these WSAs overlap more than 50% of the Canyonlands HMA. Precluding surface disturbance in these areas would maintain forage levels and preserve the free-roaming nature of the wild

burros in the Canyonlands HMA. However, managing according to the IMP could also make direct management, such as gathers, more difficult.

Areas of Critical Environmental Concern

No ACECs proposed under Alternative N would overlap with the Canyonlands HMA, resulting in no impacts to wild horses and burros.

Alternative A

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs would be proposed under Alternative N, resulting in no additional protection for wild horses and burros.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The entire Canyonlands HMA lies within the proposed Dirty Devil SRMA. Managing the Dirty Devil SRMA for a high probability of experiencing solitude with low interaction or evidence of other users would result in low levels of surface-disturbing developments and human presence, preserving the wild and free-roaming nature of wild burros in the Canyonlands HMA.

Impacts from Travel Management

Under Alternative A, no areas within the Canyonlands HMA would be open to cross-country OHV use, eliminating OHV-related impacts to the wild and free-roaming nature of the wild burros. The entire Canyonlands HMA would be limited to designated routes. The presence of OHV recreation users on 45 miles of designated routes in the HMA could temporarily displace wild burros from the proximity of riders. Given the size of the HMA, the limited number of routes, and the amount of anticipated use, the wild and free-roaming nature of the herd would not likely be eliminated.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

There would be no ACECs proposed under Alternative A, resulting in no impacts to wild horses and burros.

Proposed RMP

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Wild Horses and Burros

The proposed wild burro AML of 60–100 burros in the Canyonlands HMA would establish and maintain a genetically viable population of wild burros. Sufficient forage would be allocated to wild burros, to meet the AML. The population of wild burros would remain stable, with normal population increases for the area. There would be no difference in this impact compared to Alternative N, except that a formal AML would be established and forage is allocated. Allowing introductions of individuals from other wild burro herds into the HMA would enhance the ability to manage viable populations and decrease the gather frequency.

Impacts from Non-WSA Lands with Wilderness Characteristics

The Canyonlands HMA overlaps portions of the Labyrinth Canyon and Horseshoe Canyon South non-WSA lands with wilderness characteristics. Because non-WSA lands are closed to leasing or open to leasing subject to major constraints (NSO), require motorized users to remain on designated routes, and are generally precluded from surface-disturbing activities, wild burros roaming in these areas would be less apt to encounter human activity. This management would reduce stress levels and allow for burros' free-roaming nature, with minimal human intervention and disturbance.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

Impacts under the Proposed RMP would be similar to those described under Alternative A. No areas within the Canyonlands HMA would be open to cross-country OHV use; more than 50% of the HMA would be closed to OHV use, eliminating OHV-related impacts to the wild and free-roaming nature of wild burros. OHV use in the remainder of the HMA would be limited to designated routes. As under Alternative N or A, the presence of OHV use on 45 miles of routes designated open in the Canyonlands HMA could temporarily displace wild burros from the proximity of use. Given the size of the HMA, the limited number of routes, and the amount of anticipated use, the burros' wild and free-roaming nature would not be eliminated.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild Scenic Rivers

WSRs would have little or no impact on Wild Horses & Burros. The HMA does not overlap with any of the suitable or eligible WSR segments.

Areas of Critical Environmental Concern

No ACECs proposed under the Proposed RMP would overlap with the Canyonlands HMA, resulting in no impacts to wild horses and burros.

Alternative C

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Wild Horses and Burros

Increasing the AML to 120–200 wild burros in the Canyonlands HMA would allow wild burros to be the predominant user of the area's resources. This AML, a 100% increase compared to the Proposed RMP, would allow for the population to be maintained well above the level needed for a genetically viable population. Sufficient forage (1,200 AUMs) to meet the AML would be allocated to wild burros. The population of wild burros would be allowed to increase, with water as the main limiting factor in the area.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs would proposed under Alternative C, resulting in no additional protection for wild horses and burros.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

No areas within the Canyonlands HMA would be open to cross-country OHV use; more than 50% of the HMA would be closed to OHV use, eliminating OHV-related impacts to the wild and free-roaming nature of the wild burros. OHV use in the remainder of the HMA would be limited to designated routes. These impacts are the same as under the Proposed RMP; however, the presence of OHV use on designated routes would be reduced by 57% under Alternative C. Wild burros could be temporarily displaced by OHV use on only 19 miles of open routes. Given the size of the HMA, the limited number of routes, and the amount of anticipated use, the burros' wild and free-roaming nature would not be eliminated.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

A small portion of the proposed Dirty Devil ACEC and almost all of the proposed Horseshoe Canyon ACEC overlaps with the Canyonlands HMA. Management prescriptions for the protection of these ACECs' relevant and important values could impact wild burros. Proposed actions that would reduce surface disturbance and improve water and riparian resources would benefit the burros. These actions would include implementing VRM Class II designations, limiting OHV use, and restricting oil and gas leasing. However, fencing of riparian areas to exclude livestock would also exclude burros. Unless water was developed outside of the riparian area prior to fencing, this decision could result in loss of water sources for the burros. Within this desert environment, excluding the burros from water could result in moderate-to-major impacts, depending on the number and location of water sources involved.

Alternative D

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

The Canyonlands HMA overlaps portions of the Labyrinth Canyon, Horseshoe Canyon South, and Dirty Devil/French Spring non-WSA lands with wilderness characteristics. Because non-WSA lands are closed to leasing, closed to OHVs, and generally precluded from surface-disturbing activities, wild burros roaming in these areas would be less apt to encounter human activity. This would reduce stress levels and allow for their free-roaming nature, without human intervention and disturbance.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be similar to those described under Alternative A. However, under Alternative D, the majority of the Dirty Devil SRMA would be closed to OHV use and closed to leasing, for the protection of WSAs and non-WSA lands with wilderness characteristics. Under Alternative D, more acres would also be managed for primitive to semi-primitive recreation opportunities. This management would result in additional acres being protected from surface-disturbing activities, resulting in additional benefits to the burros, compared with the other alternatives.

Impacts from Travel Management

Under Alternative D, the Canyonlands HMA would be closed to OHV use, eliminating all OHV-related impacts to the wild and free-roaming nature of the wild burros.

Impacts from Minerals and Energy

More than 50% of the HMA overlaps portions of the Horseshoe Canyon North, Horseshoe Canyon South, French Spring/Happy Canyon, and Dirty Devil WSAs. These areas are managed according to the IMP and are closed to leasing of oil and gas, leasing of non-energy solid minerals, and disposal of mineral materials. Under Alternative D, the remainder of the HMA, which lies within non-WSA lands with

wilderness characteristics, would also be closed to leasing. Mineral and energy development would cause no impact to burros.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

The impacts under Alternative D would be similar to those under Alternative C. However, management actions to protect non-WSA lands with wilderness characteristics within ACECs would further reduce the potential for surface disturbance, compared to Alternative C, thus resulting in increased benefits to wild burros. Fencing of riparian areas to exclude livestock would not be allowed on non-WSA lands within the ACECs, reducing the risk of excluding the burros from water sources. However, if long-term conditions resulted in these riparian areas failing or functioning at risk, loss of water could still cause adverse impacts to the burros.

4.3.11 Fire and Fuels Management

This analysis addresses potential impacts on fire and fuels management, caused by implementing the management actions under the alternatives described in Chapter 2. Impacts on resources, resource uses, and designations resulting from implementation of the fire management program are discussed in those particular resource sections in this chapter. This analysis focuses on those management alternatives or actions that affect fire intensity, frequency, and suppression efforts.

Many of the forest, woodland, and rangeland ecosystems in the RFO are not functioning properly because of lack of disturbance such as fire. Decisions proposed in Chapter 2 for managing the various resources and resources uses would impact BLM's ability to maintain or restore properly functioning vegetation and to manage hazardous fuel loads. The alternatives could also impact the ability to manage wildland fire use, wildfires, and prescribed fire programs.

Methods and Assumptions

Table 4-21 illustrates the assumptions for each fire management activity, by alternative.

Table 4-21. Average Annual Treatment Acreage by Alternative

Fire Management Activity	Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
Wildland Fire Use	25,000 acres	5,000 acres	25,000 acres	13,000 acres
Prescribed Fire Treatments	25,000 acres	35,000 acres	25,000 acres	11,000 acres
Non-Fire Fuels Treatments	23,600 acres	33,600 acres	23,600 acres	2,000 acres
Total Treatments	73,600 acres	73,600 acres	73,600 acres	26,000 acres
Estimated Wildfire	12,000 acres	4,000 acres	4,000 acres	4,000 acres
Post-Fire Rehabilitation	No annual acreage is listed. ESR would be conducted on any acreage that is determined to have been damaged and in need of rehabilitation.			

This analysis was based on the following assumptions:

- Fire is an important functional, natural disturbance in many of the ecological systems found in the RFO.
- A direct relationship exists between the density of human use within the RFO and the frequency of human-caused fires.
- Fire size and intensity are more likely to increase as fuel loading increases.
- Wildland fire use would not be expected to require rehabilitation. If inadvertent resource damage did occur, rehabilitation would be applied.
- Demand for fuels treatment will continue to increase over the life of the plan.

- All conservation measures pertaining to fire suppression operations would be followed, unless firefighter or public safety or the protection of property, improvements, or natural resources would render them infeasible during a particular operation. All conservation measures pertaining to fuels treatments would be followed when implementing wildland fire use, prescribed fires, and other vegetation treatments.

The analysis of potential impacts to fire and fuels management is based on the expertise of BLM resource specialists at the RFO, the Central Utah interagency fire and fuels management program, information in the Utah Statewide Land Use Plan Amendment for Fire and Fuels Management (BLM 2005e), and scientific literature. Effects were quantified, when possible. Best professional judgment was used when quantifiable data were unavailable.

In 2005, a Fire Management Plan (FMP) Environmental Analysis was completed for the Richfield District. The Final FMP amended the existing plans and proposed goals for desired conditions by using vegetation treatments including wildfire, prescribed fire, mechanical (including hand-cutting) and chemical treatments. The consequences analysis below discusses the effects that the various plan decisions would have on fire and fuels management.

Environmental Consequences

Impacts to fire and fuels management would result from actions proposed under the following resource management programs:

- Air Quality
- Vegetation
- Cultural Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on fire and fuels management.

Alternative N: No Action

Impacts from Air Quality

Maintaining State of Utah Air Quality Standards could result in fewer acres burned by using prescribed fires or wildland fire use because NAAQS cannot be exceeded. All projects must comply with the Utah Interagency Smoke Management Rule, which may limit the number of acres that could be burned or days on which burns could occur. If the air quality or Class I airsheds could be adversely impacted, wildland fire use and prescribed fires could be suspended. Consideration of regional haze could increase the restrictions on wildland fire use or prescribed fire. Potential effects to air quality would be addressed during development of the wildland fire implementation plan for each wildland fire use and in the burn

plan for each prescribed fire. Emissions from wildfire are considered acts of nature and are outside the scope of this analysis. Over time, air quality management could create minor-to-moderate impacts to the fire and fuels management program.

Impacts from Vegetation

Continuing to manage vegetation as proposed under Alternative N would move vegetation toward a more ecologically sustainable condition over a multiple-year period, as disclosed in the 2005 Land Use Plan Amendment. Over time, management would also lower the risk of losing key ecosystem components because of severe wildfires. The need for post-fire stabilization, rehabilitation, and restoration to control soil erosion, loss of wildlife habitat, and other risks would decrease. Vegetation management decisions would provide no adverse impacts to fire and fuels management under Alternative N.

Impacts from Cultural Resources

Proposed decisions for cultural resources could have some impact on the design of fuels treatment projects, as determined through site-specific environmental analysis. Projects would be designed with specific mitigations, as necessary, to inventory and protect cultural resources. Site-specific mitigations could change the design of and increase the costs of fuels treatment projects.

Cultural resources are often more at risk from impacts caused by fire suppression activities than from wildland fire itself. Suppression efforts such as fire line construction (hand or mechanical) or the establishment of helicopter bases, safety zones, and fire camps may be ground disturbing and have the potential to destroy artifacts and the integrity of cultural resource sites. Mitigations for cultural resources could have moderate-to-major impacts for prescribed fire and mechanical treatments under Alternative N.

Impacts from Visual Resources

Because fuels treatments would need to be compatible with VRM classes, the types and scope of fuels treatments would be limited in VRM Classes I and II. Alternative N includes no VRM Class I areas and 529,500 acres (25% of the RFO) of VRM Class II areas. These designations would have negligible-to-moderate impacts on fire and fuels management, depending on the proposed site.

There may be a direct conflict with VRM Class II areas if the wildland/urban interface abuts them. The National Fire Plan directs the agency to reduce hazardous fuels on federal lands adjacent to or near wildland/urban interface areas.

Proposed decisions for VRM could have some impact on the design of non-fire fuels treatment projects. Impacts to visual resources would be determined through site-specific environmental analysis. Potential effects to visual resources would be addressed during development of the wildland fire implementation plan for each wildland fire use.

Impacts from Special Status Species

Proposed decisions for SSS could impact the design of vegetation treatment projects, as determined through site-specific environmental analysis. Potential effects to SSS would be addressed during development of the wildland fire implementation plan for each wildland fire use.

Under this alternative, surface disturbing activities would be prohibited near Greater sage-grouse leks from March 1 through July 15 and within sage-grouse brooding/nesting habitat from April 1 through June 15. These proposed decisions to protect Greater sage-grouse breeding and nesting habitat would have a minor impact on vegetation treatments in the sagebrush steppe vegetation type. Project design would be mitigated to accommodate sage-grouse stipulations, increasing design and survey costs. Projects would be designed to limit introduction of invasive understory species. Measures to mitigate fire management

actions in SSS habitats could increase suppression costs, limit suppression equipment choices and tactics, require additional effort from firefighters, and limit options for treating hazardous fuels in some areas. Reintroductions of SSS could increase the areas in which these measures would be required. Impacts of the measures and reintroductions could range from negligible to minor, depending on the area and frequency and intensity of fires. Implementing species-specific restrictions could impact fire suppression activities and fuels treatment implementation.

Limiting available tools could reduce the effectiveness and efficiency of fuels reduction treatments, potentially resulting in negligible-to-moderate impacts, depending on the type of fuels treated, size of the fuels treatment, and the threat of wildfire. A full analysis, by vegetation type, for each species can be found in the *2005 Utah Land Use Plan Amendment for Fire and Fuels Management* (BLM 2005e).

Impacts from Fish and Wildlife

Building new artificial water sources would provide water for fire suppression activities. Effects would be localized and would depend on whether fires occurred near the water developments. Impacts would range from negligible to minor.

Pronghorn antelope-passable fences would reduce some seasonal fuel loads by minimizing tumbleweeds piled along fences. Impacts would be negligible to minor, as this problem has not been significant in the past.

Impacts from Fire and Fuels Management

Projected annual acreage of fire management activity is shown in Table 4-21. Continuing wildland fire management as proposed under Alternative N would (if funded) allow fire to begin to be reintroduced to fire-adapted ecosystems, reduce hazardous fuels to meet vegetative desired conditions, suppress wildfires appropriately, and support a full emergency site rehabilitation program for ecosystem rehabilitation.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no impacts to fire and fuels management.

Impacts from Forestry and Woodland Products

Management actions implemented to support the objectives of the Healthy Forest Restoration Act of 2003 would complement the ability to maintain or restore properly functioning vegetation and reduce hazardous fuels. This management assumes that activity-created fuels would be treated. Fire and fuels management activities often complement or work in conjunction with forestry and woodland programs to move toward vegetative desired conditions, especially in fire-adapted vegetative communities. Much of the current pinyon-juniper cover is more dense than the desired conditions. Fire and fuels reduction activities usually reduce density and convert cover types to a more desirable sagebrush-grass vegetative communities.

Impacts from Livestock Grazing

Livestock grazing could reduce fine-fuel loads and therefore the size and severity of wildland fires, which includes both prescribed fire and wildland fire use. During the planning phases of prescribed fire, non-use or reduced use could be requested to mitigate the lack of fine fuels in necessary areas. This does not address fine-fuel usage by wildlife. Impacts would depend on the timing, season, and location of the fire.

Impacts from Recreation

Proposed decisions regarding recreation management would have minor-to-moderate impacts on the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels. Recreational

use, such as hunting seasons and OHV special events, could limit the timing of prescribed and wildland fire use.

Increased participation in recreation activities and larger areas impacted by recreation would increase the potential for human-ignited fires. More and improved facilities and trailheads could cause an increased suppression workload, which would have a minor to moderate impact on fire and fuels management.

Impacts from Travel Management

The potential for human-ignited wildfires would increase with increased human use in the RFO. Areas accessible to motorized vehicles would likely be the most susceptible to human-ignited wildfires, but increased ignitions and acreage burned because of increased access would be difficult to quantify. Maintaining or upgrading designated routes could make these areas more accessible to fire suppression vehicles but would lead to increased public use. Increased mileage of roads and trails would result in less continuous fuels. In such areas, fires could not spread as rapidly as in areas in which fuels were more continuous, making it more difficult to restore fire to its historical role in fire-adapted vegetation.

Under Alternative N, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing the potential for human-ignited wildfires over a large portion of the RFO and continued increase of user-developed trails. Motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO; 214,000 acres (10%) of the RFO would be closed to motorized vehicle use. Under this alternative, 4,315 miles of unpaved routes in the RFO would be open to motorized use; the most under all the alternatives.

Impacts from Minerals and Energy

Development of oil and gas resources could create new facilities that would need to be protected from wildfire, thus limiting the ability to maintain or restore properly functioning vegetation through prescribed fire and wildland fire use and to reduce hazardous fuels. Impacts would range from negligible to major, depending on the actual location of the facilities and the type of vegetation onsite.

Impacts from Special Designations

Wilderness Study Areas

Managing WSAs under the IMP precludes the use of mechanical (chaining, harrowing) and manual (chainsaw) fuels-reduction treatments. This preclusion could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in some areas, such as parts of the Henry Mountains. Prescribed fire and wildland fire use would still be available for treatments in appropriate areas. Fire might be used to move toward desired conditions.

If a fire must be suppressed, then the most effective methods of suppression that are also the least damaging to wilderness values, other resources, and the environment and that require the least expenditure of public funds (including rehabilitation of the area) would be used. Impacts would depend on the location and vegetation type in the WSA.

Wild and Scenic Rivers

Under Alternative N, all eligible river segments (12 segments—135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. Proposed treatments in these river corridors would be allowed only if it was determined that they would not result in impacts to the future suitability or classification of the river segment. This management could have some impact on the design of fuels treatment projects and could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in these areas.

Areas of Critical Environmental Concern

Alternative N continues the designation of four ACECs (14,780 acres). Vegetation was specifically identified as a relevant and important value in the Beaver Wash, North Caineville Mesa, and South Caineville Mesa ACECs. Allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within those areas and would protect vegetation resources. Such management could include closing the areas to OHV use; managing the areas as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; making lands unavailable for livestock grazing in three of the four ACECs; and acquiring inholdings. However, opportunities for vegetation treatments could be limited, thus inhibiting or preventing attainment of ecological objectives and desired conditions in these areas. Beaver Wash and South Caineville Mesa ACECs are within WSAs, and management prescriptions are directed by the IMP. This would create minor impacts to the fire and fuels management program.

Alternative A

Impacts from Air Quality

Impacts would be similar to those described under Alternative N, because of compliance with state laws. Over time, air quality program management could create minor-to-moderate impacts to the fire and fuels management program.

Impacts from Vegetation

The types of impacts experienced as a result of vegetation management would be similar to those described under Alternative N. However, under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually for all treatment methods) and would complement the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels. However, differences between the two alternatives would be negligible to minor because vegetation and fire and fuels goals and objectives would be similar.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Generally, impacts would be the same as those described under Alternative N. However, this alternative does not include any stipulations on surface disturbing activities within Greater sage-grouse brooding/nesting habitat. Therefore, limitations on surface disturbing activities are less under this alternative compared to Alternative N.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

The types of impacts experienced as a result of fire and fuels management would be similar to those described under Alternative N. Projected annual acreage of fire management activity for Alternative A is shown in Table 4-21. Proposed decisions for wildland fire management would increase the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels. This alternative would allow the use of a full range of vegetation management tools, including mechanical, biological, manual, prescribed and wildland fire use, and chemical (herbicides). However, differences between the two

alternatives would be negligible to minor because vegetation and fire and fuels goals and objectives would be similar.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative A, resulting in no impacts to fire and fuels management.

Impacts from Forestry and Woodland Products

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Alternative A proposes more recreational use and better access, which usually creates more human-ignited wildfires. This alternative proposes the most new facilities, which would need to be protected from wildfire. This need could increase the fire-suppression workload.

Increased access, either by trail or road, would break up the fuel continuity, making it more difficult to restore fire to its historical role in fire-adapted ecosystems. This lack of continuity could have a minor-to-moderate impact, depending on trail/road density and location.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative A designates 449,000 acres (21%) of the RFO as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; and 0 acres would be closed to motorized vehicle use. The amount of open areas, although greatly reduced as compared to Alternative N, would still result in the potential for human-ignited wildfires over a large portion of the RFO.

The remainder of the RFO would have motorized use limited to designated routes, thereby limiting the potential for human-ignited wildfires in the majority of the RFO. Fuels would be more discontinuous with increased mileage of roads and trails in fire-adapted vegetation. The public would have access to 4,312 miles of unpaved routes (slightly less than under Alternative N).

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative A, no eligible river segments would be recommended as suitable. Opportunities for fuels treatments would not be restricted by WSR management, thereby assisting in attaining ecological objectives and reduction of hazardous fuels in the river corridors. This alternative would allow the greatest flexibility for fuels treatments within the eligible river corridors.

Areas of Critical Environmental Concern

No ACECs would be designated under Alternative A. This would result in no impact on the fire and fuels management program.

Proposed RMP

Impacts from Air Quality

Impacts would be the same as those described under Alternative A.

Impacts from Vegetation

Impacts would be the same as those described under Alternative N.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Because fuels treatments would need to be compatible with VRM classes, the types and scope of fuels treatments would be limited in VRM Classes I and II. The Proposed RMP would designate 446,900 acres as VRM Class I and 249,800 acres as VRM Class II. These designations could have some impact on the design of non-fire fuels treatment projects, particularly in VRM Class II areas in the Henry Mountains and near the towns of Torrey, Grover, and Teasdale. These impacts would make it more difficult to manage fire and fuels to achieve their goals in these areas. Potential effects to visual resources would be addressed during development of the wildland fire implementation plan for each wildland fire use.

Impacts from Special Status Species

Generally, impacts would be the same as those described under Alternative N. However, the Proposed RMP includes limitations on surface disturbing activities within Greater sage-grouse habitats that are more restrictive than those under Alternatives N and A. These limitations stipulations are expected to have a minor impact on implementation of vegetation treatments since treatments conducted within sage grouse habitat can be successfully completed outside the December 15 through July 15 timing limitation.

Impacts from Fish and Wildlife

Some of the goals of the Proposed RMP are to restore historic habitats and native plant species and to enhance, maintain, and protect ecological resources. Short-term adverse impacts would be offset by long-term effects of rehabilitation activities (built into this alternative for soil disturbing activities), protection of ecological resources (from effective fire suppression), and reduction of fuels (following prescribed fire, non-fire fuel treatment, or implementation of wildland fire use). The subsequent, gradual return to a more natural fire regime would result in long-term beneficial effects.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N; this alternative most closely resembles the previously amended plans in fire and fuels management. The combination of all types of fire and fuels treatments, if funded appropriately in the future, could lead to increased vegetation function and reduction of hazardous fuel loads to a maintenance level. Additionally, allowing temporary non-renewable use of targeted livestock grazing to reduce site-specific fuels or noxious and invasive weeds could maintain or improve upland fuel conditions and reduce cheatgrass, fine fuels, and other invasive weeds. In forests and woodlands, this action would reduce fine-fuel loads and noxious and invasive weeds, leading to improved health of these communities.

Impacts from Non-WSA Lands with Wilderness Characteristics

Managing 78,600 acres of non-WSA lands with wilderness characteristics to protect, preserve, and maintain their wilderness characteristics would limit the use of mechanical (chaining, harrowing) and manual (chainsaw) fuels reduction treatments on these lands. These areas would be available for Healthy Lands Initiative projects. However, any projects and fuels treatments would be required to meet the management objectives for the area and would be required to be consistent with VRM Class II objectives. This management could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in some areas, such as parts of the Henry Mountains.

Impacts from Forestry and Woodland Products

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The Proposed RMP proposes to manage for a blend of motorized and non-motorized recreation opportunities. Less motorized access would limit the number of human-caused fires, possibly lessening the need for suppression actions. Fewer facilities (as compared to Alternative A) would also create less suppression needs.

Access to complete fuels treatments could be limited by the establishment of SRMAs, which emphasize primitive recreation. Currently about half of the fuels treatment program uses mechanical applications. These limitations could make it difficult to treat these areas with something other than fire. The Proposed RMP would have moderate-to-major impacts on the fire and fuels management program.

Impacts from Travel Management

The types of impacts from travel management would be similar to those described under Alternative A. However, the Proposed RMP designates only 9,890 acres (less than 1% of the RFO) as open to motorized vehicles, thereby limiting the potential for human-ignited wildfires. This alternative would close 209,900 acres (10% of the RFO) to motorized use, eliminating the potential for human-ignited wildfires in those areas. The remainder of the RFO (1,908,210 acres) would have motorized use limited to designated routes; the public would have access to 4,277 miles of unpaved routes (slightly less than under Alternative N).

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under the Proposed RMP, one suitable segment (5 miles) would be managed to protect its outstandingly remarkable values, free-flowing nature, and tentative classification. Proposed treatments in this river corridor would be allowed only if it was determined that they would not result in impacts to the suitability or tentative classification of the river segment. This management could have some impact on the design of fuels treatment projects and could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in this area. The Proposed RMP would allow flexibility for fuels

treatments on fewer miles of eligible river segments than under Alternative A but on more miles than under Alternative N, C, or D.

Areas of Critical Environmental Concern

Proposed management direction for ACECs would have no impact on managing vegetation and reducing hazardous fuels. Management of the Old Woman Front ACEC would provide for fire and fuels management activities. Proposed management to protect relict vegetation would have negligible impact on the fire and fuels management program.

Alternative C

Impacts from Air Quality

Impacts would be similar to those described under Alternative A. Although possibly fewer acres would be treated (both annually and over the life of this Proposed RMP), if the air quality or Class I airsheds could be adversely impacted, wildland fire use and prescribed fires could be suspended. Over time, air quality program management could create minor-to-moderate impacts to the fire and fuels management program.

Impacts from Vegetation

The types of impacts experienced as a result of vegetation management would be similar to those described under Alternative A, although under Alternative C, fewer acres would be treated annually (averaging 26,000 annually for all treatments). In addition, Alternative C proposes using only natural processes to manage vegetation. These processes could be less effective than conventional vegetation treatments and would not be effective in all vegetation communities. This management would limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in some areas. Vegetation management decisions would have moderate-to-major impacts to fire and fuels management because the acreage treated would be limited.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Impacts would be the same as those described under the Proposed RMP.

Impacts from Special Status Species

Impacts would be similar to those described under the Proposed RMP. However, Alternative C does not include a NSO stipulation within ½ mile of Greater sage-grouse leks or a timing limitation (December 15 through March 14) on surface disturbing activities in sage grouse winter habitat. Therefore there would be fewer limitations on doing vegetation treatments under Alternative C compared to the Proposed RMP.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fire and Fuels Management

Projected annual acreage of fire management activity is shown in Table 4-21. The types of impacts experienced as a result of fire and fuels management would be similar to those described under Alternative A, although under Alternative C, fewer acres would be treated annually (averaging 26,000 annually for all treatments). In addition, this alternative proposes using only natural processes to manage vegetation. These processes could be less effective than conventional vegetation treatments and would not be effective in all vegetative communities. Compared to Alternative A, Alternative C would limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in some areas,

thus potentially creating greater threats to life, property, and other resources by allowing larger and more severe wildfires.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no impacts to fire and fuels management.

Impacts from Forestry and Woodland Products

Commercial timber harvest would not be allowed under Alternative C, potentially resulting in increased fuel loading. The impact of this disallowance would be minor to moderate, as the quantity of forest and woodland products harvested commercially are relatively small in the RFO.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Alternative C proposes to manage for primarily primitive and semi-primitive recreation opportunities. Less motorized access would limit the number of human-caused fires, possibly lessening the need for suppression actions. Fewer facilities would also create less suppression needs.

Access to complete fuels treatments could be limited by the establishment of SRMAs. Currently about half of the fuels treatment program uses mechanical applications. This limitation could make it difficult to treat areas with something other than fire. Alternative C would have moderate-to-major impacts on the fire and fuels management program.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under the Proposed RMP. However, Alternative C designates no areas as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,445,000 acres (68%) of the RFO; and 683,000 acres (32%) would be closed to motorized vehicle use. The lack of open areas would minimize the potential for human-ignited wildfires, reducing the fire suppression workload. It would also reduce the ability to treat vegetation with non-fire treatment methods. This reduction would have minor-to-moderate impacts because fire is not always the proper tool to initially treat vegetation.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N but would be reduced in scope because less area would be available for surface-disturbing activities under Alternative C.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those discussed under Alternative N. All 12 suitable river segments (135 miles) would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative C. Proposed treatments in these river corridors would be allowed only if it were determined that they would not result in impacts to the suitability or tentative classification of the river segment. This management could have some impact on the design of fuels treatment projects

and could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in these areas.

Areas of Critical Environmental Concern

Some proposed wildlife decisions for managing ACECs could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels by using mechanical means. Proposed management direction (outside WSAs) for suppressing wildfires in the Fremont Gorge/Cockscomb, Henry Mountains, Kingston Canyon, Parker Mountain, Rainbow Hills, and Sevier Canyon ACECs could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels. Fire would be limited from playing a natural role because of the wildlife limitations in crucial deer habitat; this fire limitation could have a moderate-to-major impact. Proposed management direction for other ACECs would have minor-to-moderate impact on managing vegetation and reducing hazardous fuels.

Alternative D

Impacts from Air Quality

Impacts would be the same as those described under Alternative C.

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Because fuels treatments would need to be compatible with VRM classes, fuels treatments would be limited in VRM Classes I and II (in which the existing character of the landscape must be preserved or retained). Alternative D would be the most restrictive to fire and fuels management because it has the most VRM Class I and II acres (1,196,300 acres combined or 56% of the RFO).

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, protecting the non-WSA lands with wilderness characteristics would preclude the use of mechanical (chaining, harrowing) and manual (chainsaw) fuels reduction treatments on these lands. This preclusion could limit the ability to maintain or restore properly functioning vegetation and to reduce hazardous fuels in some areas, such as parts of the Henry Mountains.

Impacts from Forestry and Woodland Products

Commercial timber harvest would not be allowed under Alternative D, potentially resulting in increased fuel loading. The impact of this loading would be minor to moderate, as the quantity of forest and woodland products harvested commercially are relatively small in the RFO.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be similar to those described under Alternative C, except there would be even less access under Alternative D. This would have moderate-to-major impacts to the fire and fuels management program.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. However, Alternative D designates 972,800 acres (46% of the RFO) as limited to designated routes and 1,155,200 acres (54%) as closed to motorized vehicle use. Lack of access would limit the number of human-ignited wildfires, reducing the fire suppression workload. However, it would also reduce the ability to treat vegetation with treatment methods other than those that mimic natural processes (fire and biological). This limitation would have moderate-to-major impacts because fire is not always the proper tool to initially treat vegetation.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N but would be reduced in scope. The least area would be available for surface-disturbing activities under Alternative D.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.3.12 Non-WSA Lands with Wilderness Characteristics

Non-WSA lands with wilderness characteristics are areas having 5,000 acres, or areas less than 5,000 acres that are contiguous to designated wilderness, WSAs or other administratively endorsed for wilderness management lands or, in accordance with the Wilderness' Act's language, areas "of sufficient size as to make practicable its preservation and use in an unimpaired condition". BLM used the same criteria for determining wilderness characteristics as in the 1979 wilderness inventory. The 5,000 acre value was helpful to BLM in making preliminary judgments, but it was not considered a limiting factor.

These areas also provide outstanding opportunities for solitude or primitive forms of recreation (non-motorized and non-mechanized activities in undeveloped settings). Generally, actions that create surface disturbance impact the natural character of these areas and the setting for experiences of solitude and primitive recreational activities. Motorized uses in these areas detract from opportunities for both solitude and primitive forms of recreation.

Lands with wilderness characteristics outside of existing WSAs in the RFO are identified in Chapter 3 and shown on Map 3-9, and include 29 areas within the RFO, totaling 682,600 acres or 32% of the RFO lands. These areas are concentrated on the east side of the RFO, with large blocks in the Henry Mountains and Dirty Devil regions and smaller areas immediately west of Capitol Reef National Park, in southeastern Sevier County, and in southern Piute County (Chapter 3, Non-WSA Lands with Wilderness Characteristics and Map 3-9). Management decisions under Alternatives N, A, and C would, to varying degrees, impact the wilderness characteristics of these lands. The PRMP/FEIS includes management prescriptions for 12 of the 29 areas, totaling 78,600 acres. Proposed decisions under Alternative D would best protect the naturalness and outstanding opportunities for solitude and primitive recreation within these areas. Table 4-22 shows an additive comparison of key proposed decisions under each alternative in Chapter 2 for acres of OHV area designations, miles of designated routes, acres of fluid mineral stipulation areas, acres of VRM class designations, and acres of proposed withdrawals that are within non-WSA lands with wilderness characteristics.

Table 4-22. Comparison of Key Decisions within Non-WSA Lands with Wilderness Characteristics

Resource /Resource Use		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
OHV Area Designations	Open	656,100 ac 96%	221,800 ac 32%	5,700 ac <1%	0 ac 0%	0 ac 0%
	Limited	5,000 ac 1%	460,800 ac 68%	642,650 ac 94%	473,100 ac 69%	0 ac 0%
	Closed	21,500 ac 3%	0 ac	34,250 ac 5%	209,500 ac 31%	682,600 ac 100%
OHV Route Designations	Miles of Designated Routes	51.2	360.7	429.2	99.7	0
Fluid Minerals	Standard	577,800 ac 85%	329,650 ac 48%	252,000 ac 35%	202,100 ac 30%	0 ac 0%
	TL, CSU	89,800 ac 13%	352,950 ac 52%	288,100 ac 51%	267,100 ac 39%	0 ac 0%

	VRM Class III	144,955 ac 21%	213,660 ac 31%	117,555 ac 17%	152,955 ac 22%	0 ac 0%
	VRM Class IV	376,380 ac 55%	468,940 ac 69%	380,580ac 56%	365,880 ac 54%	0 ac 0%
Proposed Withdrawals		0 ac 0%	0 ac 0%	11,200 ac 2%	110,900 ac 16%	682,600 ac 100%

Methods and Assumptions

The following assumption regarding the future management of non-WSA lands with wilderness characteristics is made:

- Any new surface disturbing activities proposed would be subject to NEPA analysis. Activities proposed that would not initially meet wilderness characteristic objectives for an area being managed for those characteristics would be mitigated to the extent needed to meet the objectives for both the Proposed RMP and Alternative D.
- The Proposed RMP management actions would protect, preserve and maintain the wilderness characteristics on 78,600 acres through the following land allocations and prescriptions:
  - Designate as Visual Resource Management (VRM) Class II
  - Limit motorized use to designated routes
  - Retain lands in public ownership
  - Designate as an Avoidance Area for rights-of-way (ROW)
  - Designate leasing category as no surface occupancy (NSO), no exceptions, waivers, or modifications
  - Close to mineral material sales
  - Designate as unavailable for further consideration for coal leasing
  - Continue maintenance and use of existing facilities
  - Prohibit private or commercial woodland harvest or seed collection
  - Healthy Lands Initiative projects could be considered where they improve the overall goals and objectives for managing the wilderness characteristics of these areas
- The DRMP/DEIS Alternative D management actions would protect, preserve and maintain the wilderness characteristics on 682,600 acres through the following land allocations and prescriptions:
  - Designate as VRM Class I
  - Manage for primitive and semi-primitive non-motorized recreation
  - Close to motorized use
  - Retain land in public ownership
  - Designate as an Avoidance Area for ROWs
  - Propose for withdrawal from mineral entry

- Close to oil and gas leasing
- Close to mineral material sales
- Designate as unavailable for further consideration for coal leasing.

Environmental Consequences

Impacts to non-WSA lands with wilderness characteristics would likely result from actions proposed under the following resource management programs:

- Soil Resources and Water Resources
- Vegetation
- Cultural Resources
- Paleontological Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Wild Horses and Burros
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on non-WSA lands with wilderness characteristics. There are no WSA decisions that would impact non-WSA lands with wilderness characteristics resources.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

No surface disturbance or occupancy would be permitted within the 100-year flood plain (or 500 feet of the bank full line) of perennial streams or perennial reaches of streams (with some exceptions). This protection would prevent soil and vegetation disturbances and placement of structures that would degrade the naturalness of non-WSA lands with wilderness characteristics. Protection of naturalness would preserve the setting needed to support opportunities for primitive forms of recreation and experiences of solitude.

Under Alternative N, no surface disturbance or occupancy would be permitted within 500 feet of natural springs, to protect water quality. Prohibiting soil and vegetation disturbance or placement of structures around natural springs in non-WSA lands with wilderness characteristics would maintain or enhance the naturalness of small portions (approximately 18 acres around each spring) of the non-WSA lands. Protection of the water sources would maintain and enhance the wildlife populations that depend on the water, providing continued opportunities for primitive recreation—(wildlife viewing or hunting).

Impacts from Vegetation

Inventory of riparian areas not functioning or functioning at risk would result in the identification and implementation of measures to restore these areas to proper functioning condition, which would enhance the natural condition of the riparian portions of non-WSA lands with wilderness characteristics. Riparian zones are critical to the lifecycles of many wildlife species (fish, amphibians, mammals, and birds). These areas are typically scenic and desired recreation settings. Maintenance and restoration of riparian zones, and retention of these zones in public ownership, would maintain and enhance opportunities for primitive recreation, including hiking, wildlife viewing, camping, nature study, fishing, and other activities dependent upon water courses and riparian ecosystems. Coordination of these efforts with neighboring federal, state, tribal, and local governments and with private conservation groups would expand the cited benefits to a larger scale and broader reach.

Existing vegetation treatments would be maintained to provide suitable habitat for wildlife and adequate forage for livestock. In the long term, maintenance of vegetation treatment areas through fire would maintain or enhance wildlife habitat and populations of species (deer, elk, bison, Greater sage-grouse, Utah prairie dog, song birds) that are dependent on that habitat. If these treatments occurred in non-WSA lands with wilderness characteristics, healthy wildlife populations would enhance opportunities for primitive recreation (wildlife viewing and hunting). In the short-term, however, burning operations would result in disturbance of the landform and vegetation through fire line construction needed to manage the fire. Furthermore, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the burning operation and reclamation. When the fire and reclamation operations were complete, these opportunities would return. Soil and vegetation disturbance for fire line construction would diminish the natural character of the non-WSA lands, but reclamation would restore the natural conditions in a relatively short period.

The use of aircraft for aerial reseeding of vegetation treatment areas, or the use of rangeland drills, would result in the presence and noise of people, vehicles, equipment, and aircraft that would diminish opportunities for solitude and would conflict with primitive recreational activities. When reseeding was complete, however, these disruptions of opportunities for solitude and primitive recreation would end, and the opportunities would return.

Under Alternative N, vegetation would be manipulated through the full range of treatment tools (including fire, mechanical, chemical, or biological) to achieve and maintain *Fundamentals of Rangeland Health* and the desired vegetation condition. In the long-term, vegetation treatments through fire would restore vegetation communities and a more natural composition of grasses, forbs, shrubs, or trees. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural character of the non-WSA lands. However, in the short term, a burning operation would result in disturbance of the landform and vegetation because of the fire line construction needed to manage the fire. Further, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the prescribed burning operation and reclamation. When the fire and reclamation operations were complete, these opportunities would return. Soil and vegetation disturbance for fire line construction would diminish the natural character of the non-WSA lands, by introducing an apparent human-made element to the landscape. However, reclamation would restore the natural conditions in a relatively short period.

Mechanical vegetation manipulation in non-WSA lands with wilderness characteristics would have long-term impacts on the natural character of the non-WSA lands and on opportunities for solitude and primitive and unconfined recreation. Although restoration of vegetation communities would be beneficial

to the natural character of non-WSA lands with wilderness characteristics, the use of chainsaws, bulldozers, brush hogs, and so forth to accomplish the objective would leave an obvious imprint of human activity on the land, diminishing the natural character of the non-WSA area(s). Also, in the short term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long term, a setting clearly manipulated by humans would reduce the opportunities for experiencing solitude and primitive recreation.

Weed control through mechanical, biological, and chemical methods would have the same effects on naturalness, solitude, and primitive recreation as those described for vegetation treatments. Restoring vegetation communities to a more natural composition of plants would improve the natural character of non-WSA lands with wilderness characteristics. However, mechanical treatments would have similar effects on naturalness as described previously. Chemical and biological treatment would appear more natural. The noise and presence of people, vehicles, equipment, and aircraft used during treatment of weeds would temporarily reduce opportunities for solitude and would conflict with primitive recreational activities.

Impacts from Cultural Resources

Surface-disturbing actions (other than archaeological research) would not be authorized in the Bull Creek Archaeological District. This action would protect the natural character of 322 acres of the Mount Ellen non-WSA lands with wilderness characteristics by preventing new disturbance that other actions could cause to the land and vegetation. Because no new actions would be permitted to disturb the surface of the non-WSA lands, there would be no presence or noise of the people, vehicles, and equipment needed to implement a future action and thus, no reduction of opportunities for solitude or conflicts with primitive recreational activities.

Mitigation of impacts to cultural resources caused by activities authorized by the BLM would preserve knowledge of cultural resources and some sites. However, although project stipulations would mitigate impacts to cultural resources, they would not prevent implementation of the activity. Depending on the nature of the activity (e.g., surface-disturbing, placement of structures, motorized travel), implementation of the project could still degrade the natural character of non-WSA lands with wilderness characteristics and could conflict with opportunities for solitude and primitive recreation, if the activity took place in a non-WSA area. Consultation with Native American tribes regarding project mitigation would have the same effects as BLM mitigation of authorized activities on cultural resources, and thus on naturalness, solitude, and primitive recreation, as described previously.

Impacts from Paleontological Resources

Decisions on management of paleontological resources provide for inventory, mitigation of impacts to fossils resulting from BLM-authorized activities, interpretation of and education about fossils, collection of common invertebrate and plant fossils, and protection of significant vertebrate and invertebrate fossils. As with cultural resources, knowing more about the paleontological resources of the area, interpreting the resource in an appropriate fashion, viewing fossil sites in the non-WSA lands with wilderness characteristics, and protecting significant fossils from collection or damage would add to the enjoyment of these areas for primitive recreational purposes. Protection of fossils adds to the character of the setting that supports these recreational opportunities. However, collection of even common invertebrate fossils, although providing a primitive recreational experience, would remove an element of the natural landscape.

Impacts from Visual Resources

There are four objectives for VRM (VRM Classes I–IV) that provide for various levels of landscape protection and change. The objective of VRM Class I is to preserve the characteristic landscape; the

objective of VRM Class IV provides for landscape modifications (Chapter 3, Visual Resources). Land use planning decisions to designate and manage areas by Class I objectives would preserve the characteristic landscape. In non-WSA lands with wilderness characteristics, this objective (Class I) would preserve the natural character of the area. VRM Class II objectives would retain the characteristic landscape, allowing for minor changes to the landform and vegetation. This objective would generally protect the natural condition of the land in non-WSA areas. The objective of VRM Class III is to partially retain the existing character of the landscape, allowing for moderate changes to land and vegetation. This objective is not compatible with preserving the natural character of non-WSA lands. Class IV objectives provide for major modification of the landscape, clearly incompatible with preservation of the natural character of non-WSA lands.

Under Class I and II objectives, preserving the natural character of the non-WSA lands would also preserve the undeveloped setting needed to support opportunities for solitude and primitive forms of recreation. Because Class III and IV VRM objectives would not preserve an undeveloped setting, opportunities for both solitude and primitive recreation would be diminished.

Table 4-23 shows the VRM class designations by non-WSA area and by alternative.

Table 4-23. VRM Class Designations, by Non-WSA Lands with Wilderness Characteristics Area (Acres)

Under Alternative N, 161,265 acres would be managed by VRM Class I and II objectives in all or parts of 17 non-WSA lands with wilderness characteristics areas, protecting the natural character of those lands. Conversely, 521,335 acres would be managed by Class III and IV objectives. While the focus of these VRM objectives is to provide for activities and uses that would change the landscape, this does not mean that every acre would be developed or changed. Thus, in those non-WSA lands managed by Class III and IV objectives, the natural character of the affected non-WSA lands could be lost. If the naturalness of these areas was lost, the opportunities for solitude and primitive recreation would be lost because the setting needed to support these opportunities would be altered.

Impacts from Special Status Species

Alternative N (along with all the other alternatives) includes management actions that focus on maintaining, protecting, and enhancing habitats for SSS. Decisions that could help protect non-WSA lands with wilderness characteristics include prohibiting actions that would destroy, adversely modify, or fragment the habitat of federally listed threatened or endangered species; maintaining the integrity of SSS habitats; and generally retaining habitats for federally listed and candidate species that occur in lands

under federal ownership. These decisions would help to maintain the natural character of non-WSA lands with wilderness characteristics, when they intersect with SSS habitat. Virtually all non-WSA lands with wilderness characteristics have SSS raptors and plants.

Depending on the method used, habitat improvement treatments conducted for SSS could degrade the naturalness of the non-WSA lands. While the habitat manipulation is being conducted, the opportunity for solitude and primitive recreation would be disrupted, and the naturalness of the area could be impaired.

Allowing for the introduction, augmentation, translocation, and transplantation of SSS, if done within non-WSA lands with wilderness characteristics, could enhance the wildlife-viewing opportunities often associated with primitive recreation experiences.

Impacts from Fish and Wildlife

A variety of actions would be implemented to restore, maintain, and enhance wildlife populations. Improved wildlife populations would augment the natural character of the land in all the non-WSA lands with wilderness characteristics. Furthermore, larger and healthier wildlife populations would expand opportunities for primitive and unconfined recreation, including wildlife viewing and hunting. In addition, strategies to avoid or reduce habitat fragmentation, such as collocating facilities, employing directional drilling, and reducing road densities, would be implemented. These strategies would help to maintain the natural character of non-WSA lands with wilderness characteristics, when they intersect with wildlife habitat.

Habitat treatments to meet terrestrial, aquatic, and riparian habitat objectives would be accomplished through the use of prescribed fire and chemical, biological, and mechanical methods. The use of fire or biological and chemical treatments would leave no apparent evidence of human intervention on the landscape. Thus, there would be no noticeable effect on the natural character of the non-WSA lands with wilderness characteristics, if those treatments were necessary in the non-WSA areas that have wilderness characteristics. Restoration of vegetative communities would result in a more natural vegetative community and thus a more natural condition of the non-WSA areas. The use of mechanical treatments for vegetation manipulations would leave a noticeable imprint of human work on the landscape and would degrade the natural character of non-WSA lands, if the treatments were to occur on those lands. Depending on the vegetative community treated (e.g., grassland and shrub land, a woodland or coniferous forest), the length of time that the evidence of mechanical treatments remained on the landscape before the surface and vegetation disturbances returned to a more natural or unmodified condition would vary.

Allowing for the introduction, augmentation, translocation, and transplantation of native or naturalized fish and wildlife species, if done within non-WSA lands with wilderness characteristics, could enhance the wildlife-viewing opportunities often associated with primitive recreation experiences.

The Henry Mountains bison and mule deer range overlays portions of the Mount Ellen—Blue Hills, Ragged Mountain, Mount Pennell, Bull Mountain, and Mount Hillers non-WSA lands with wilderness characteristics. No specific management for the Henry Mountains bison and mule deer habitat area is proposed under Alternative N; therefore, impacts to those non-WSA lands with wilderness characteristics that overlay the habitat cannot be determined.

Impacts from Wild Horses and Burros

The Canyonlands HMA would be managed to maintain herds for genetic viability. The Canyonlands HMA overlaps portions of the Labyrinth Canyon, Horseshoe Canyon South, and Dirty Devil/French Spring non-WSA lands with wilderness characteristics. Maintaining this HMA at existing levels would continue to provide opportunities for viewing of wild burros, which is often associated with primitive recreation experiences.

Impacts from Fire and Fuels Management

BLM would attempt to manage fire and fuels, where appropriate, to restore natural systems to their desired condition, considering the interrelated social and economic components. Restoration of fire to fire-dependent and fire-adapted ecosystems would restore a more natural vegetation community (in both species and composition), watershed conditions, and wildlife populations dependent on those communities. In the short term, a burned landscape may reduce opportunities for primitive recreation. However, in the long-term, a more natural landscape would benefit the natural character of non-WSA lands with wilderness characteristics and would enhance the setting and opportunities for primitive forms of recreation, including hiking, backpacking, hunting, wildlife viewing, and nature study.

The RFO would base its priorities for all aspects of fire management decisions on the General Risk Categories (Appendix 6), to determine where fire is or is not desired. Furthermore, ESR actions would be developed and implemented following any wildland fire event, as appropriate. Fuels treatment and management activities would be consistent with the resource goals and objectives in the Proposed RMP and might include mechanical treatments, manual treatments, prescribed fire, chemical spraying, or biological treatments and seeding.

Setting fire objectives through fire management categories would identify where fire is desired on the land, leading to the same benefits to natural conditions as restoring fire to fire-dependent and fire-adapted ecosystems. When it is necessary to suppress fire in non-WSA lands with wilderness characteristics, developing and implementing the ESR plan would result in restoration of fire suppression-related disturbances (e.g., fire line construction), which would also restore the natural character of the non-WSA areas. Fuels treatments in non-WSA lands with wilderness characteristics would aid in restoration of a more natural fire regime in these lands. The use of fire to accomplish this reduction would be compatible with the natural character of these areas. The use of mechanical treatments would leave an apparent imprint of human work on the land, thus degrading the natural character of the non-WSA lands with wilderness characteristics.

In the short term, fire operations (e.g., aircraft over-flights, fire line construction) would degrade the natural landscape and character of the non-WSA lands with wilderness characteristics. The noise and presence of people, equipment, and operations would also diminish opportunities for solitude and primitive forms of recreation. However, in the long term, surface disturbance associated with the fire treatment would be restored, with little to no net effect on naturalness. The effects of fire operations on opportunities for solitude and primitive recreation would cease, and those opportunities would be restored.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative N, no specific actions would be prescribed to directly protect the naturalness and opportunities for solitude or primitive recreation of the non-WSA areas, resulting in no specific benefits to non-WSA lands with wilderness characteristics; because there are no prescriptions and technically no non-WSA lands with wilderness characteristics.

Impacts from Forestry and Woodland Products

Permits for commercial timber harvest would be prohibited east of Capitol Reef National Park, thereby protecting from surface-disturbing activities associated with timber harvest the wilderness characteristics within Long Canyon, Bullfrog Creek, Mount Pennell, Dogwater Creek, Notom Bench, Mount Ellen—Blue Hills, Red Desert, Muddy Creek/Crack Canyon, Wild Horse Mesa, Flat Tops, Sweetwater Reef, Labyrinth Canyon, Horseshoe Canyon South, Dirty Devil/French Spring, Fiddler Butte, Little Rockies, Mount Hillers, Ragged Mountain, and Bull Mountain non-WSA lands with wilderness characteristics (where timber resources may exist).

Non-WSA lands with wilderness characteristics that would be at risk for commercial timber harvest activities are within the Fremont Gorge, Jones Bench, Limestone Cliffs, Mussentuchit Badlands, Rock Canyon, Wildcat Knolls, Kingston Ridge, Phonolite Hill, Rocky Ford, and Pole Canyon areas, where timber resources may exist. Activities associated with commercial harvest, such as heavy equipment or chain saw use, construction of new roads, cutting of trees and leaving of stumps and debris, and human activity would diminish the wilderness characteristics values of naturalness, solitude, and primitive recreation opportunities within the areas being harvested.

Permits for non-commercial woodland products (primarily firewood cutting) would continue to be sold to the public in all 20 non-WSA areas east of Capitol Reef National Park. These areas would remain open for wood cutting. Where resources exist, wilderness characteristics might be compromised by surface-disturbing activities such as driving cross-country to the trees or cutting the trunks of trees and leaving stumps and debris, and by affecting the solitude and primitive recreation opportunities through the use of chain saws and surface disturbances associated with human activity.

Commercial live plant and seed collection would be allowed in all 29 non-WSA lands with wilderness characteristics areas. If permits were sold within the non-WSA lands, this activity could affect the natural character of these areas because of cross-country OHV travel to the specific areas of collection. This travel would crush vegetation and compact soil, and could lead to proliferation of new OHV routes in OHV open areas. In addition, surface disturbance associated with live plant collection could leave unnatural holes in the ground (from digging up plant roots). Temporary impacts associated with human activity and potential presence of mechanized equipment would affect solitude and primitive recreation opportunities while the collection crews were in the non-WSA areas.

Impacts from Livestock Grazing

Livestock grazing is guided by objectives set in the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*. Appropriate levels of livestock use are guided by these objectives. Thus, it is not anticipated that livestock grazing would have impacts on non-WSA lands with wilderness characteristics because meeting these objectives would not permit degradation of the lands. When livestock use is properly managed, it does not affect the appearance of naturalness. Grazing assessments completed by RFO staff and any subsequent actions taken to remedy impending issues would enhance the natural character of non-WSA lands with wilderness characteristics. Furthermore, improved natural conditions would sustain the setting needed to support opportunities for primitive and unconfined recreation and the experience of solitude that visitors seek.

Although there could be some visual evidence of livestock use in the areas (presence of livestock, feces, trampling of soil, fences, and consumption of vegetation), rangeland health and riparian conditions would be maintained through proper management to meet or maintain SRH and the implementation of *Guidelines for Grazing Management*, and the appearance of natural condition in these areas would continue. For some visitors, the presence of livestock would be an adverse impact on the desired experience (connection with the natural world and experiences of solitude). However, this effect would be seasonal. At other times of the year livestock would not be present, soils would recover and vegetation would regrow, reducing the impact on the visitor.

Impacts from Recreation

The decision to limit or control activities where long-term damage is observed or anticipated would help protect the naturalness values of wilderness characteristics under all alternatives. Such control could be implemented by designating campsites, providing permits, closing areas, or limiting the numbers of users and duration of usage in these areas. In addition, encouraging the location of public land recreational activities near population centers and highway corridors would help to maintain the naturalness of the more-remote lands with wilderness characteristics.

ERMAs

No specified management for ERMAs are described under Alternative N. Therefore wilderness characteristics values could be affected by any number of recreational activities in any of the non-WSA lands with wilderness characteristics.

SRMAs

Under Alternative N, no SRMAs that overlay non-WSA lands with wilderness characteristics would be established. Therefore there would be no impacts to wilderness characteristics because of SRMAs. Recreation activities would continue without the focused management provided by the establishment of SRMAs. Impacts from cross-county OHV use and other recreational surface-disturbing activities would affect naturalness and opportunities for solitude and primitive recreation.

Impacts from Travel Management

Cross-country motorized vehicle travel would adversely impact lands with wilderness characteristics by reducing opportunities for solitude and primitive recreation (through the presence and noise of machines) and by directly impacting soils and vegetation, which are elements of naturalness. Table 4-24 shows the OHV area designations by alternative within the non-WSA lands with wilderness characteristics.

		Closed	0	0	0	300	6,700

Under Alternative N, 1,636,400 acres of the RFO would be open to cross-country travel, meaning that no restrictions would be placed on cross-country motorized use for game retrieval, use off of designated routes for the purposes of parking or staging, or motorized access to campsites. The RFO also has the discretion to authorize cross-country travel for any commercial or organized group events. These actions would continue to degrade the natural character of the non-WSA lands with wilderness characteristics by allowing new surface-disturbing activity from motorized vehicles. The sights and sounds of vehicle travel would also conflict with solitude and primitive recreation experiences.

Current management designates 656,100 acres (96%) of the 29 non-WSA lands with wilderness characteristic areas as open to cross-country travel. Cross-country motorized travel in these non-WSA lands would result in surface disturbance to soils and vegetation, altering the landscape and diminishing the natural character of these non-WSA lands. Furthermore, the presence and noise of motorized vehicles would degrade a visitor's opportunity for solitude and would conflict with opportunities for primitive and unconfined recreation activities.

Under Alternative N, OHV use is limited to designated routes in 5,000 acres (1%) within 3 of the 29 non-WSA lands with wilderness characteristics. In these areas, 51.2 miles of routes would be designated (Table 4-25).

Table 4-25. OHV Route Designations in Non-WSA Lands with Wilderness Characteristics, Alternative N

Non-WSA Area Name	Miles of Routes
Little Rockies	7.8 miles
Mount Ellen—Blue Hills	30.4 miles
Pole Canyon/Hunter Spring	13 miles

Limiting OHV use would confine to existing routes the soil and vegetation disturbance caused by motor vehicles, and would result in no additional change to the natural character of the non-WSA lands. However, the presence and noise of vehicles using these routes would reduce the opportunity of visitors to find solitude in the non-WSA areas, especially in proximity to the routes. Motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA areas.

Currently, 21,500 acres (3%) within 5 of the 29 non-WSA lands with wilderness characteristics areas are closed to OHV use (Table 4-26).

Table 4-26. Acres Closed to OHVs in Non-WSA Lands with Wilderness Characteristics, Alternative N

Non-WSA Area Name	Closed Acres
Dirty Devil/French Spring	10,900 acres
Fremont Gorge	1,800 acres
Mount Ellen—Blue Hills	4,000 acres
Mount Pennell	1,000 acres
Muddy Creek/Crack Canyon	3,800 acres

Because these areas are closed, no routes would be designated so surface disturbance caused by motorized travel and the resultant impacts to the natural character of the non-WSA areas would not occur. Furthermore, the opportunities for conflict between primitive forms of recreation and motorized uses in these areas would not occur. The natural character and opportunities for solitude and primitive recreation of these non-WSA areas would be unaffected by OHV travel.

OHV open areas near communities would be considered and encouraged for leasing under authority of the Recreation and Public Purposes Act (R&PP), to allow local management of OHV play areas. Generally these areas would include previously disturbed areas and would be considered on a case-by-case basis. If an R&PP open area was leased and overlapped non-WSA areas, the action would continue to degrade the natural character of the non-WSA lands with wilderness characteristics by allowing the surface-disturbing activity from motorized vehicles to continue. The sights and sounds of vehicle travel would also conflict with solitude and primitive recreation experiences.

Impacts from Lands and Realty

Land Tenure Adjustments

Land tenure adjustments (except for FLPMA Section 203 land sales) would be considered if they met the specific criteria outlined in Chapter 2. Non-WSA lands with wilderness characteristics could be disposed of if there is public demand for any of these lands and if they meet the land disposal criteria. If disposed

of, the lands would be outside of BLM's management control and protection of wilderness characteristics could be foregone.

Alternative N identifies no lands as available for FLPMA land sales within non-WSA lands with wilderness characteristics, resulting in no impacts to non-WSA lands.

Withdrawals

Under Alternative N, there are no existing or recommended withdrawals within non-WSA lands with wilderness characteristics. The non-WSA lands would be open to location and entry under the mining laws, new mining claims could be filed at any time, and new proposals for exploration and development could be submitted and reviewed under the surface management regulations for undue and unnecessary degradation. Therefore, the non-WSA lands could be impacted by denuding the naturalness and by creating loss of primitive recreation activities and solitude for those areas in which new mining activities might occur. If new mining development does occur within these areas, direct loss of wilderness characteristics would be unavoidable because of the major surface-disturbing activities associated with mining activities.

Rights-of-Way and Other Land Use Authorizations

No ROW corridors are proposed under Alternative N.

Non-WSA lands with wilderness characteristics that would remain open to granting of ROWs include all of 21 areas and portions of 8 areas, totaling 658,697 acres. Any surface-disturbing activity or placement of permanent facilities would detract from the natural character of the area and would disrupt the setting needed to support primitive forms of recreation.

Under Alternative N, 23,903 acres in eight non-WSA lands with wilderness characteristics areas would be protected, in part, from surface-disturbing actives because they would be within ROW avoidance areas (Table 4-27). Portions of the Dirty Devil/French Spring, Flat Tops, Fremont Gorge, Little Rockies, Mount Ellen—Blue Hills, Muddy Creek/Crack Canyon, Red Desert, and Wildcat Knolls non-WSA lands with wilderness characteristics would be within the ROW avoidance areas. These areas would be avoided but might be available for location of ROWs with special stipulations if the proposal meets the goals and objectives of other resources and uses in the LUP. It is expected and assumed that the avoidance areas would protect the natural character of the non-WSA lands in these areas.

Table 4-27. Acres of Avoidance or Exclusion for ROWs in Non-WSA Lands with Wilderness Characteristics

Total Acres of Avoidance and Exclusion Areas	**23,903**	**6**	**142,500**	**312,168**	**682,600**
Total Acres Open for ROWs	**658,697**	**682,594**	**540,100**	**370,432**	**0**

The RFO would be available for other land use authorizations (such as film permits, leases, and easements) if the use associated with an authorization was compatible with other decisions throughout the Proposed RMP. Activities authorized under a permit, lease, or easement would need to be in conformance with OHV area designations, VRM management classes, and so forth. It is difficult to speculate where these activities might occur and what the proposed activity would entail. If the proposal was for a

minimally impactful activity, it is likely that no impacts to wilderness characteristics would occur from that activity. However, if the proposed activity involved ground disturbance and use of motorized vehicles, then wilderness characteristics would likely be affected, thus impacting naturalness of the area and creating loss of primitive recreation activities and solitude.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to leasing within non-WSA lands with wilderness characteristics (Table 4-28) and existing leases are discussed in the area-by-area analysis. Exploration and development activities could impact wilderness characteristics through the direct disturbance of natural terrain, consequently impacting solitude and opportunities for primitive recreation. Virtually all the lands with wilderness characteristics would be open to leasing under Alternative N.

The mineral assumptions for analysis and the RFD scenarios were used in the analysis of impacts to non-WSA lands with wilderness characteristics. The *Mineral Potential Report* (BLM 2005b) for the RFO describes the oil and gas occurrence potential and serves as the basis for the RFD. The RFD assumes that all potentially productive areas, except those areas designated as closed to leasing by law, regulations, or EO, are open to leasing subject to the standard terms and conditions. In the RFO, non-WSA lands with wilderness characteristics fall within two RFD areas.

The largest RFD area (Areas 1 and 2 of the RFD Report) incorporates the majority of non-WSA lands with wilderness characteristics (24 areas). This RFD area includes all of the lands in Piute, Wayne, and Garfield Counties within the Richfield planning area. These non-WSA areas total 645,800 acres within the 2,618,000 acres of this RFD area, or 25% of the RFD area (Table 4-29). This acreage does not include the acres closed to leasing by law, regulation, or EO (including WSAs and NPS lands, among others). The RFD scenario for oil and gas development in this RFD area predicts that during the next 15 years, approximately 45 exploratory wells (or 3 wells per year) would disturb a total of 540 acres (12 acres per well), and an additional 240 acres would be minimally disturbed by geophysical operations. There are four non-WSA areas with existing leases that total 51,510 acres. Most notable is the Flat Tops non-WSA area, which has 92% of its lands under existing leases.

Table 4-29. Non-WSA Lands with Wilderness Characteristics in Piute, Wayne, and Garfield Counties within RFD Areas 1 and 2

Name of Non-WSA Lands With Wilderness Characteristics Area	Percent of RFD Areas 1 and 2	Acres of Non-WSA Lands with Existing Leases (Percent Leased)

Little Rockies	1 %	0
Long Canyon	<1 %	0
Mount Ellen—Blue Hills	2 %	0
Mount Hillers	<1 %	0
Mount Pennell	2.5 %	0
Muddy Creek/Crack Canyon	2.5 %	0
Notom Bench	<1 %	0
Phonolite Hill	<1 %	0
Pole Canyon/Hunter Spring	<1 %	0
Ragged Mountain	1 %	0

Name of Non-WSA Lands With Wilderness Characteristics Area	Percent of RFD Areas 1 and 2	Acres of Non-WSA Lands with Existing Leases (Percent Leased)
Red Desert	1.5 %	0
Rocky Ford	<1 %	0
Sweetwater Reef	<1 %	195 (3%)
Wild Horse Mesa	2 %	80 (<1%)

The other RFD area (Area 3 of the RFD Report) incorporates the remaining five non-WSA lands with wilderness characteristics (Wildcat Knolls, Rock Canyon, Mussentuchit Badlands, Limestone Cliffs, and Jones Bench), in Sevier County. These non-WSA areas total 36,800 acres within the 702,400 acres of this RFD area, or about 5% of the RFD area (Table 4-30). The RFD scenario for oil and gas activity in RFD Area 3 predicts that during the next 15 years, approximately 49 exploratory wells (or about 3 wells per year) would disturb a total of 1,100 acres (22 acres per well), and an additional 360 acres would be minimally disturbed by geophysical operations. There are no existing leases within the five non-WSA areas.

Table 4-30. Non-WSA Lands with Wilderness Characteristics in Sevier County within RFD Area 3

Name of Non-WSA Lands With Wilderness Characteristics Area	Percent of RFD Area 3	Acres of Non-WSA Lands with Existing Leases
Jones Bench	<1 %	0
Limestone Cliffs	3.5 %	0
Mussentuchit Badlands	<1 %	0
Rock Canyon	<1 %	0
Wildcat Knolls	1 %	0

A number of variables would determine the degree of impact to non-WSA lands with wilderness characteristics. These variables would include where surface-disturbing activities occur, landform or topography, vegetation type, oil and gas potential (as determined by exploration), sequence of exploration and development, and reclamation time. Soil types and climate would affect the time needed to reclaim disturbances.

Construction and operation of oil and gas wells and associated support facilities (including roads, surface and buried pipelines, power lines, and compressor stations) would create soil and vegetation disturbance and the presence of permanent structures that would degrade the naturalness and opportunities for primitive recreation and solitude of non-WSA lands with wilderness characteristics. In addition to site-specific surface disturbance, the cumulative number of wells would change the appearance of naturalness.

The noise of construction and drilling wells, as well as the presence of work crews, vehicles, and equipment, would degrade opportunities for solitude and would conflict with primitive recreational opportunities in proximity to these activities. Such activities could affect wildlife distribution in addition to creating physical disturbances on the ground. As recreational visitors seeking solitude move away from the oil and gas activity, the sights and sounds of activity would diminish. If oil and gas is discovered, then

the oil and gas activity would be longer term. However, it can be expected that sights and sounds from exploration and development would reduce opportunities for solitude and primitive and unconfined recreation up to one-half mile beyond the area of surface disturbance and direct loss of natural character.

The RFD for combined Areas 1 and 2 and for Area 3 is 45 wells and 49 wells, respectively. Although a wildcat well could discover producible oil or gas, the RFD addresses wells without a prediction of production. Thus, the RFD is for well pads and access, not necessarily for facilities needed for production.

Under Alternative N, all or portions of the 29 non-WSA lands with wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 682,600 acres of non-WSA lands with wilderness characteristics within the RFD areas. Of these, 667,600 acres are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). This acreage comprises about 98% of non-WSA areas. Two percent (15,000 acres) of the non-WSA lands with wilderness characteristics, spread between five areas, would be open to leasing subject to major constraints (NSO) or would be closed to leasing.

In RFD Areas 1 and 2, all or portions of 24 non-WSA lands with wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 645,800 acres of non-WSA lands with wilderness characteristics within this combined RFD area. Of these, 630,800 acres are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). The other 15,000 acres are either closed to leasing or open to leasing subject to major constraints (NSO): 1,000 acres (1%) in Dirty Devil/French Spring; 8,100 acres (35%) in Little Rockies; 2,200 acres (14%) in Fremont Gorge; 200 acres (less than 1%) in Mount Ellen—Blue Hills; and 3,500 acres (6%) in Muddy Creek/Crack Canyon. There would be no waivers, exceptions, or modifications to the NSO stipulation under Alternative N.

Currently, the Flat Tops and Dirty Devil/Crack Canyon non-WSA areas contain the greatest percentage of leased non-WSA lands with wilderness characteristics. As stated previously, the projection for drilling for oil and gas is 45 wells during the 15-year RFD scenario. Under Alternative N, the non-WSA lands with wilderness characteristics in which surface-disturbing activities associated with oil and gas exploration would be allowed would comprise 24% of the RFD area. Assuming that the predicted wells are evenly distributed in the RFD area, then one-fourth of the predicted RFD of three wells per year—one well per year, or 15 wells during a 15 year period—could be drilled within any of these non-WSA areas. This drilling could disturb as much as 12 acres per year, or as much as 180 acres over the life of the plan. Leasing and subsequent exploration within these non-WSA areas would cause that portion of the non-WSA area to lose its natural character and opportunities for solitude and primitive recreation because of exploration for and development of oil and gas resources. However, it is not anticipated that any of these non-WSA areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the number of projected wells in this RFD area during the 15-year scenario.

In RFD Area 3, all five non-WSA lands with wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 36,800 acres of non-WSA lands with wilderness characteristics in the RFD area. Given that the projection for drilling for oil and gas is 3 wells per year for the entire RFD area, and that only 5% of the RFD area encompasses non-WSA lands with wilderness characteristics areas, then 2 of the 49 wells (i.e., 5% of 49) would be drilled within the five non-WSA lands with wilderness characteristics during the 15-year RFD scenario. This drilling could disturb as much as 44 acres in the non-WSA lands over the life of the Proposed RMP. Given the size of the Limestone Cliffs non-WSA area, the two wells projected on non-WSA lands are assumed most likely to be within this area. However, the area represents

only 3.5% of the entire RFD area. Exploration and development within these non-WSA areas would cause that portion to lose its natural character and opportunities for solitude and primitive recreation because of exploration for and development of oil and gas resources. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the number of projected wells in this RFD area during the 15-year scenario.

Geophysical exploration activities would be authorized for all non-WSA lands with wilderness characteristics, subject to oil and gas leasing categories. Geophysical activities would have short-term, minimal impacts on naturalness because of crushed vegetation, tire tracks, and small drill holes and their cuttings. The presence of equipment, humans, noise, and work associated with geophysical exploration activities would impact solitude and primitive recreation opportunities in the short term. When the geophysical activity ceased, solitude and primitive recreation opportunities would resume and disturbances to the naturalness would be restored in the short term.

Leasable Minerals—Geothermal

About two-thirds of the Kingston Ridge non-WSA lands with wilderness characteristics area overlies a high-potential area for geothermal resources. Under Alternative N, this non-WSA area remains open for geothermal leasing, either open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). If the area was leased and developed, impacts to the wilderness value would occur. Loss of naturalness and opportunities for solitude and primitive recreation would result from drilling activities, pipeline development, road construction, power plants, and other infrastructure.

Leasable Minerals—Coal

Coal resources suitable for leasing are within the Henry Mountains coal field and underlie portions of the Mount Pennell, Wild Horse Mesa, and Mount Ellen—Blue Hills non-WSA lands with wilderness characteristics areas. This coal field includes both surface and subsurface coal resources. Other coal resources suitable for leasing are within the Emery coal field and include the Limestone Cliffs and Rock Canyon non-WSA lands with wilderness characteristics areas. All this coal has been determined suitable for subsurface coal mining only.

All non-WSA lands with wilderness characteristics underlain by coal resources suitable for leasing could potentially be leased and mined, pending a leasing EIS and further analysis. If leased, 4,925 acres in the Mount Ellen—Blue Hills non-WSA lands; 4,930 acres in the Mount Pennell non-WSA lands; and 82 acres in Wild Horse Mesa non-WSA lands could be available for leasing by surface mining methods. Surface mining for the coal resources would entail strip mining operations. The naturalness of those areas within the mining operations would be foregone, as vegetation would be stripped, soil and earth removed, and the coal resources mined. Heavy equipment and infrastructure support for mining operations, as well as motorized equipment noise and human activity, would degrade, if not preclude, opportunities for solitude and primitive recreation within those immediate areas. As much as 10% of the Mount Ellen—Blue Hills non-WSA area, 8% of the Mount Pennell non-WSA area, and less than 1% of the Wild Horse Mesa non-WSA area could forego their wilderness characteristics if the total surface coal resource was mined.

In addition to the surface coal resource, both Mount Pennell and Mount Ellen—Blue Hills have subsurface coal resources found suitable for mining. If leased, an additional 4,980 acres in the Mount Ellen—Blue Hills non-WSA area and 25,200 acres in the Mount Pennell non-WSA area could be available for leasing by subsurface mining methods. In the Emery coal field, underground coal resources suitable for leasing by underground mining methods encompass 3,970 acres in the Limestone Cliffs and

64 acres in the Rock Canyon non-WSA lands with wilderness characteristics. Subsurface mining for the coal resources would entail surface disturbance associated with portals, ventilation shafts, access roads, and other necessary facilities and infrastructure. None of these disturbances would be large scale or would encompass many acres. The naturalness in these disturbed areas would be impacted, but to a much smaller extent than through surface mining operations. The most significant impact would be caused by access roads. In addition, opportunities for solitude and primitive recreation would be foregone within these areas. It is important to note that although extensive acreage could be leased and mined for underground coal resources, relatively minor surface impacts would occur compared to surface-mining impacts.

Exploration activities for coal resources could be authorized within any of the non-WSA lands with wilderness characteristics. These activities could include the use of cross-county travel with drilling rigs and field crews, for not more than 2 years in an identified area. This travel could cause tracks from motorized use, crushed vegetation and compacted soil, and other surface disturbances. Pad construction might be an outcome of deep drilling. However, this disturbance would be temporary and reclamation would be required during the time that the exploratory activities occurred. Opportunities for solitude and primitive recreation would be affected in the short term, and naturalness would be impacted until the area was reclaimed.

Non-Energy Solid Leasable Minerals

Non-energy solid leasable minerals would be under the same restrictions as oil and gas resources. The same non-WSA lands with wilderness characteristics that would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) would be available for exploration and development. Similarly, those non-WSA lands that would be closed to leasing or open to leasing subject to major constraints (NSO) would be unavailable for exploration and development (Table 4-28). The non-WSA lands with wilderness characteristics that would have the greatest potential for sodium or potassium occurrence are within portions of the Labyrinth Canyon, Horseshoe Canyon South, and Dirty Devil/French Spring areas. Where mining these resources would occur, impacts to wilderness characteristics would include drilling, road construction, evaporation ponds, human activities, and other necessary infrastructure. These impacts would degrade the wilderness characteristics through loss of naturalness and opportunities for primitive recreation and solitude.

Locatable Minerals

All 29 non-WSA lands with wilderness characteristics areas are located within high-potential areas for uranium and vanadium. Existing mining claims as of May 2007 have been located within the Mount Pennell, Mount Hillers, Bull Mountain, Ragged Mountain, Little Rockies, Dirty Devil/French Spring, Wild Horse Mesa, Muddy Creek/Crack Canyon, Mount Ellen—Blue Hills, Fremont Gorge, Rock Canyon, Limestone Cliffs, and Kingston Ridge areas. As of May 2007, recent mining-related activity had caused no surface-disturbing actions within the non-WSA lands. If new mining development were to occur within these areas, direct loss of wilderness characteristics would be unavoidable because of major surface-disturbing activities associated with mining activities. Under Alternative N, there would be no existing or recommended withdrawals within non-WSA lands with wilderness characteristics. (See withdrawal discussion under the Impacts from Lands and Realty section of this alternative.)

Salable Minerals

Salable minerals would be under the same restrictions as oil and gas resources. The same non-WSA lands with wilderness characteristics that would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) would be available for salable mineral disposal. Similarly, those non-WSA lands that would be closed to leasing or open to leasing subject to major constraints (NSO) would be unavailable for salable mineral disposal (Table 4-28). The non-WSA

lands with wilderness characteristics that would have the greatest potential for sand and gravel occurrence overlie portions of the Little Rockies, Mount Hillers, Ragged Mountain, Bull Mountain, Mount Ellen—Blue Hills, Wild Horse Mesa, Fremont Gorge, and Rocky Ford areas. The non-WSA lands with wilderness characteristics that would have the greatest potential for stone occurrence overlie all the Fremont Gorge area. The non-WSA lands with wilderness characteristics that would have the greatest potential for humate occurrence overlie portions of the Wild Horse Mesa, Muddy Creek/Crack Canyon, and Limestone Cliffs areas.

All or portions of the 29 non-WSA lands with wilderness characteristics areas would remain open to salable mineral disposal. Of the 682,600 acres of non-WSA lands with wilderness characteristics, 667,600 acres would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). This acreage comprises about 98% of non-WSA areas. Where surface disturbance would occur, naturalness and opportunities for primitive recreation and solitude would be foregone. If the gravel pits or building-rock quarries had associated support facilities, including roads and power lines, then soil and vegetation disturbance and the presence of permanent structures would degrade the natural characteristics of non-WSA lands with wilderness characteristics. The noise of the operations of sand and gravel pits or rock quarries, as well as the presence of work crews, vehicles, and equipment, would degrade opportunities for solitude and would conflict with primitive recreational opportunities in proximity to industrial development. As recreational visitors moved away from the sources of development, the sights and sounds of development would diminish. It can be expected that sights and sounds from development would reduce opportunities for solitude and primitive and unconfined recreation for as much as one-half mile beyond the direct area of loss of natural character, depending on topography.

Two percent (15,000 acres) of the non-WSA lands with wilderness characteristics spread between five areas would be open to leasing subject to major constraints (NSO) or would be closed to salable mineral disposal. It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be in concert with other resource goals and objectives in these areas. Thus, the wilderness characteristics of the areas would be maintained.

Impacts from Special Designations

Wild and Scenic Rivers

Under Alternative N, 4 of the 29 non-WSA land areas intersect with eligible WSR segments, totaling 33.35 miles in those 4 areas. There are 19.31 miles of Dirty Devil River, 0.12 miles of No Man's Canyon, 2.83 miles of Robbers Roost Canyon, 0.13 miles of Sam's Mesa Box Canyon, 1.39 miles of Twin Corral Box Canyon, 5 miles of Fremont River (Fremont Gorge), 3.26 miles of Fremont River (Capital Reef National Park to Caineville Ditch Diversion), and 1.4 miles of Maidenwater Creek that would be managed to preserve their WSR eligibility. Protection of river values would prevent uses and surface disturbances that would detract from the natural character of the Dirty Devil/French Spring, Fremont Gorge, Red Desert, and Little Rockies non-WSA lands with wilderness characteristics within the half-mile river corridor (one-quarter mile of the high water mark on each bank of the river segment).

Areas of Critical Environmental Concern

Under Alternative N, ACEC designation and management would continue for the four existing ACECs, to protect a variety of relevant and important values. Three of the four ACECs would overlay non-WSA lands with wilderness characteristics. Those ACECs are North Caineville Mesa, South Caineville Mesa, and Beaver Wash. The management prescriptions for these ACECs would protect naturalness and opportunities for solitude and primitive recreation in all the non-WSA lands within the ACECs.

A portion (2,200 acres) of the Muddy Creek/Crack Canyon non-WSA lands with wilderness characteristics lies within the existing 2,200 acre North Caineville Mesa ACEC. As a result of the management prescriptions for the ACEC, these non-WSA lands with wilderness characteristics would be closed to OHV use, open to leasing subject to major constraints (NSO), unavailable for livestock grazing, identified as unsuitable for surface coal mining, and recommended for withdrawal from mineral entry; also, inholdings would be acquired from willing sellers. These prescriptions would prevent surface disturbances, limit motorized uses, and protect the natural character of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation.

A small portion (4 acres) of the Mount Ellen—Blue Hills non-WSA lands with wilderness characteristics area lies within the existing 4,100 acre South Caineville Mesa ACEC. These non-WSA lands with wilderness characteristics would be closed to OHV use, open to leasing subject to major constraints (NSO), unavailable for livestock grazing, and identified as unsuitable for surface coal mining. These ACEC management prescriptions would prevent surface disturbances, limit motorized uses, and protect the natural character and opportunities for solitude and primitive recreation of the non-WSA lands with wilderness characteristics.

A portion (68 acres) of the Dirty Devil/French Spring non-WSA lands with wilderness characteristics lies within the existing 4,800 acre Beaver Wash ACEC. As a result of the management prescriptions for the ACEC, these non-WSA lands with wilderness characteristics would be closed to OHV use, closed to leasing, and recommended for withdrawal from mineral entry; also, land tenure adjustment, including acquisition of all state sections within the ACEC, would be pursued. These prescriptions would prevent surface disturbances, limit motorized uses, and protect the natural character and opportunities for solitude and primitive recreation of the non-WSA lands with wilderness characteristics.

Alternative A

Impacts from Soil Resources and Water Resources

Impacts would be similar to those described under Alternative N, except that no surface disturbance or occupancy would be permitted within 330 feet of natural springs, to protect water quality and riparian vegetation. The effects on the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would therefore occur on fewer acres, compared to Alternative N.

Impacts from Vegetation

Impacts would be similar to those described under Alternative N, except that no surface disturbance or occupancy would be permitted within approximately 330 feet of natural springs (based on geo-hydrological, riparian, and other factors) to protect riparian vegetation. The effects on the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would therefore occur on fewer acres, compared to Alternative N.

When disturbance could not be avoided or mitigated onsite, compensatory offsite mitigation would maintain the total acreage of riparian vegetation in the RFO. However, protection of riparian zones would not necessarily occur in non-WSA lands, nor would it necessarily result in benefits to the naturalness or opportunities for solitude or primitive recreation of non-WSA lands. Compensation might occur either inside or outside the non-WSA lands.

Under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 annually for all treatments). Because no target treatment acreage limits (maximum or minimum) would be set under Alternative N, it is likely (based on historic trends) that in some years, fewer acres would be treated under

Alternative N, whereas in other years (when there are numerous wildland fires), more acres could be treated under that alternative.

Precise locations for vegetation treatments are not known at this time, but if these treatments were to occur in non-WSA lands, the types of impacts experienced would be similar to those described under Alternative N.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative N for the Bull Creek Archaeological District. In addition, allocation of cultural sites to scientific, public, conservation, traditional, and experimental uses under Alternative A would increase knowledge of cultural resources and would enhance opportunities for primitive forms of recreation. Knowing more about the cultural resources of an area, interpreting the resource in an appropriate fashion, and viewing cultural resource sites in the non-WSA areas would add to the enjoyment of these areas for primitive recreational purposes. Protection of cultural resources would add to the character of the setting that supports these recreational opportunities.

Providing Native American tribes access to public lands for traditional purposes might impact wilderness characteristics of non-WSA lands. If access is provided by motorized vehicle, the noise and presence of vehicles would reduce opportunities for solitude and would conflict with primitive forms of recreation.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM would be similar to those described under Alternative N. Under Alternative A, no non-WSA lands would be designated as VRM Class I or II to retain landscape character. All lands would be managed for uses and activities that might result in changes to the landscape. (However, this management does not mean that every acre would be developed or would change.) The natural character of the non-WSA lands could be lost. If the naturalness of these areas was lost, the opportunities for solitude and primitive recreation would be lost because the setting needed to support these opportunities would be altered.

Impacts from Special Status Species

The types of impacts experienced as a result of SSS management would be similar to those described under Alternative N. In addition, under Alternative A, strategies would be employed that would avoid or reduce fragmentation of SSS habitat. These strategies could include collocating communication and other facilities, employing directional drilling for oil and gas, and closing and reclaiming roads. If a proposed project were located on non-WSA lands with wilderness characteristics, these strategies would help to consolidate surface-disturbing activities and would protect additional acres from loss of naturalness. However, any surface-disturbing activities would still impair the naturalness of the areas and could affect solitude and primitive recreation opportunities in the areas in which the strategies were employed.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative A, there would be no specific actions prescribed to directly protect the naturalness and opportunities for solitude or primitive recreation of the non-WSA areas, resulting in no impacts to non-WSA lands.

Impacts from Forestry and Woodland Products

Under Alternative A, commercial and non-commercial timber harvest would be allowed where feasible, sustainable, and compatible with restoring, maintaining, or improving forest health. All non-WSA lands with wilderness characteristics that have timber would be open to timber-harvest permitting. Activities associated with timber harvest would diminish the wilderness characteristics values of naturalness, solitude, and primitive recreation opportunities within the areas being harvested. These activities include the use of heavy equipment and chain saws, new road construction, cutting trees and leaving stumps and debris, and human activity.

Permits for commercial and non-commercial woodland products (primarily fire-wood cutting) would continue to be sold to the public in all 29 non-WSA areas (where the resources exist), which would remain open for such activities. If permits were sold within non-WSA lands, wilderness characteristics would be compromised by surface-disturbing activities such as driving cross-country to the trees and cutting the trunks of trees and leaving stumps and debris. The use of chain saws and the surface disturbances associated with human activity activities would affect solitude and primitive recreation opportunities.

Commercial live plant and seed collection impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

ERMAs

Public lands in the Fiddler Butte, Labyrinth Canyon, Mount Ellen—Blue Hills, and Little Rockies non-WSA areas would be managed in a primitive, naturally appearing setting for a high probability of experiencing solitude and closeness to nature. This management would be accomplished by preserving resources, managing access primarily as non-motorized, and providing minimum improvements and no onsite interpretive facilities. This management would protect the wilderness characteristics values of naturalness and would enhance opportunities for solitude and primitive recreation in portions of these non-WSA lands with wilderness characteristics.

Designating campsites and areas appropriate for large group events and camping at Sandy Creek Overlook would impact the naturalness and opportunities for solitude and primitive recreation in the northernmost portion of the Mount Pennell non-WSA lands with wilderness characteristics area. This impact would affect less than 1% of this 65,600 acre non-WSA area.

SRMAs

Three of the proposed SRMAs would overlap portions of eight non-WSA lands with wilderness characteristics. There would be 317,010 acres of non-WSA lands within the three SRMAs (or 46% of non-WSA lands).

The 290,000 acre Dirty Devil/Robbers Roost SRMA would encompass 110,860 acres within the Dirty Devil/French Spring non-WSA area; 20,640 acres of the Horseshoe Canyon South non-WSA area; and 12,283 acres of the Labyrinth Canyon non-WSA area. Because this SRMA would be managed for its primitive values and no competitive events would be permitted, the wilderness characteristics of this area would be maintained and opportunities for solitude and a primitive recreation experience would be protected.

The 199,700 acre Factory Butte SRMA and the 12,300 acre Sahara Sands SRMA would encompass 173,215 acres of the Mount Ellen—Blue Hills non-WSA area; 61,680 acres of the Muddy Creek/Crack Canyon non-WSA area; 40,550 acres of the Red Desert non-WSA area; 49,640 acres of the Wild Horse Mesa non-WSA area; and 25 acres of the Fiddler Butte non-WSA area. Both SRMAs would be managed as OHV open (cross-country) areas with developed facilities. This management would be in conflict with wilderness characteristic values because naturalness would be compromised through surface-disturbing activities, and opportunities for solitude and primitive recreation would be foregone because of OHV cross-country travel and associated noise. Facility development would also impair wilderness characteristics through surface-disturbing activities and reduction of natural values.

Impacts from Travel Management

Alternative A would designate 18 areas managed as open OHV play areas. Of these 18 open areas, 9 would comprise 221,800 acres (32%) within 14 of the 29 non-WSA lands with wilderness characteristics areas that would be open to cross-country travel:

- A portion (200 acres) of the Little Rockies non-WSA lands with wilderness characteristics lies within the 19,500 acre proposed Ticaboo Play Area.
- A portion (200 acres) of the Fiddler Butte non-WSA lands with wilderness characteristics lies within the 12,700 acre proposed Sahara Sands Play Area.
- Portions of the Dirty Devil/French Spring (13,100 acres), Flat Tops (200 acres), and Sweetwater Reef (1,900 acres) non-WSA lands with wilderness characteristics lie within the 19,700 acre proposed Roost Play Area.
- Portions of the Mount Ellen—Blue Hills (21,400 acres), Muddy Creek/Crack Canyon (61,800 acres), Red Desert (40,700 acres), and Wild Horse Mesa (49,700 acres) non-WSA lands with wilderness characteristics lie within the 200,100 acre proposed Factory Butte Play Area.
- A portion (10,900 acres) of the Fremont Gorge non-WSA lands with wilderness characteristics lies within the 9,800 acre proposed Miners Mountain and 5,000 acre proposed Beas Lewis Flat Play Areas.
- A portion (4,400 acres) of the Pole Canyon/Hunter Spring non-WSA lands with wilderness characteristics lies within the 4,600 acre proposed Hunter Spring Play Area.
- Portions of the Kingston Ridge (2,900 acres) and Phonolite Hill (7,700 acres) non-WSA lands with wilderness characteristics lie within the 102,700 acre proposed Antelope Range/Kingston Canyon Play Area.
- A portion (6,700 acres) of the Rocky Ford non-WSA lands with wilderness characteristics lies within the 12,900 acre proposed Rocky Ford Play Area.

Cross-country motorized travel in these non-WSA lands would result in surface disturbance to soils and vegetation and would alter the landscape and diminish the natural character of these non-WSA lands. Further, the presence and noise of motorized vehicles would degrade visitors' opportunity for solitude and would conflict with opportunities for primitive and unconfined recreation activities.

Under Alternative A, there are no specific management prescriptions for managing OHV use in non-WSA lands with wilderness characteristics. However, management actions for other resources and resource uses

would place limitations on OHV use in these areas. OHV use would be limited to designated routes in 460,600 acres (68%) within 25 of the 29 non-WSA lands with wilderness characteristics, as identified under Alternative D. In these areas, 360.7 miles of routes would be designated as shown in Table 4-31.

Table 4-31. OHV Route Designations in Non-WSA Lands with Wilderness Characteristics, Alternative A

Non-WSA Area Name	Miles of Routes
Bull Mountain	1.8 miles
Bullfrog Creek	20.7 miles
Dirty Devil/French Spring	146.2 miles
Dogwater Creek	0.1 miles
Fiddler Butte	3.3 miles
Flat Tops	26.2 miles
Fremont Gorge	11.5 miles
Horseshoe Canyon South	10.9 miles
Jones Bench	0.9 miles
Kingston Ridge	6.6 miles
Labyrinth Canyon	2.2 miles
Limestone Cliffs	14.1 miles
Little Rockies	8.3 miles
Long Canyon	2 miles
Mount Ellen—Blue Hills	30.4 miles
Mount Hillers	1.9 miles
Mount Pennell	30.8 miles
Mussentuchit Badlands	0 miles
Notom Bench	3.6 miles
Phonolite Hill	10.1 miles
Pole Canyon/Hunter Spring	13 miles
Ragged Mountain	11.1 miles
Rock Canyon	1.2 miles
Sweetwater Reef	3.8 miles
Wildcat Knolls	0 miles

Limiting OHV use would confine to designated routes the soil and vegetation disturbance caused by motor vehicles, thus resulting in no additional change to the natural character of the non-WSA lands. However, the presence and noise of vehicles using these routes would reduce visitors' opportunity to find solitude in the non-WSA areas, especially in proximity to the routes. Motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA areas.

Under Alternative A, motor vehicles would be allowed to pull off of a designated route as much as 100 feet to either side of the centerline (for parking/staging). Motor vehicles would be allowed to use existing spur routes for ingress and egress to established campsites within 300 feet of the centerline of designated routes but would be prohibited from traveling between multiple campsites, establishing motorized play areas or race tracks, or traveling across wet meadows or riparian areas. These actions would allow for parking and camping while confining the areas in which soil and vegetation disturbance would occur, thus resulting in limited change to the natural character of the non-WSA lands.

OHV open areas near communities would be considered and encouraged for leasing under authority of the R&PP, to allow local management of OHV play areas. Generally these areas would include previously disturbed areas and would be considered on a case-by-case basis. If an R&PP open area was leased and overlapped non-WSA areas, the action would continue to degrade the natural character of the non-WSA lands with wilderness characteristics, by allowing the surface-disturbing activity from motorized vehicles to continue. The action would also conflict with opportunities for solitude and primitive recreation experiences away from the sights and sounds of vehicle travel.

Impacts from Lands and Realty

Land Tenure Adjustments

Alternative A identifies as available for FLPMA Section 203 sales three parcels (600 acres) of land in the Notom Bench, Red Desert, and Dogwater Creek non-WSA lands with wilderness characteristics. One parcel (80 acres) is in the Notom Bench non-WSA area; one parcel (160 acres) is in the Red Desert non-WSA area; and one parcel (360 acres) is in the Dogwater Creek non-WSA area. All three parcels are interspersed with private lands adjoining the Capitol Reef National Park boundary. Disposal of these lands would take them out of public ownership and would allow for development and surface-disturbing activities outside of BLM's control. The wilderness characteristics could be foregone because the lands would no longer be under BLM control.

Withdrawals

Impacts would be the same as those described under Alternative N.

Rights-of-Way and Other Land Use Authorizations

Four proposed ROW corridors would overlay small slivers of the exterior boundaries of nine non-WSA lands with wilderness characteristics areas. Each corridor would be 800 feet wide (400 feet to each side of the centerline). The proposed State Highway 24 ROW corridor would overlay the Wild Horse Mesa, Red Desert, Fremont Gorge, and Notom Bench non-WSA lands with wilderness characteristics. The proposed State Highway 95 and State Highway 276 ROW corridors would overlay slivers of Little Rockies and Fiddler Butte non-WSA lands with wilderness characteristics. The proposed State Highway 62 ROW corridor would overlay slivers of Rocky Ford, Phonolite Hill, and Kingston Ridge non-WSA lands with wilderness characteristics. Placement of future utility ROWs within these corridors would diminish the wilderness characteristics in the areas by creating surface-disturbing activities (and possibly by placing surface facilities) that would no longer maintain the wilderness characteristics values in those linear corridors.

Non-WSA lands with wilderness characteristics that would remain available for granting of ROWs include all of 28 areas and portions of 1 area, totaling 682,594 acres. Any surface-disturbing activity or placement of permanent facilities would detract from the natural character of the area and would disrupt the setting needed to support primitive forms of recreation.

Under Alternative A, 6 acres in one non-WSA lands with wilderness characteristics area would be protected in part from surface-disturbing actives because those acres would be within ROW avoidance

areas (Table 4-27). Portions of the Fremont Gorge non-WSA lands with wilderness characteristics would be within the ROW avoidance areas. These areas are to be avoided but might be available for location of ROWs with special stipulations if the proposal met the goals and objectives of other resources and uses in the LUP. It is expected and assumed that the avoidance areas would protect the natural character of the non-WSA lands in these areas.

Impacts from issuance of other land use authorizations would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing within non-WSA lands with wilderness characteristics are listed in Table 4-28. Exploration and development activities could impact wilderness characteristics through the direct disturbance of the natural terrain and consequent impacts on solitude and opportunities for primitive recreation. Virtually all the lands with wilderness characteristics would be open to leasing under Alternative A. The types of impacts experienced as a result of oil and gas activities would be the same as those described under Alternative N.

All 29 non-WSA lands with wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 682,600 acres of non-WSA lands with wilderness characteristics within the RFD areas. All these acres would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU).

As described under Alternative N, the RFD scenario for oil and gas development in RFD combined Areas 1 and 2 predicts that during the next 15 years, approximately 45 exploratory wells (3 wells per year) would disturb a total of 540 acres (12 acres per well), and an additional 240 acres would be minimally disturbed by geophysical operations. In RFD Areas 1 and 2, 24 non-WSA wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 645,800 acres of non-WSA lands with wilderness characteristics within this combined RFD area. All acres would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). The non-WSA lands with wilderness characteristics that have the greatest percentage leased at this time would be in the Flat Tops and Dirty Devil/French Spring areas. The non-WSA lands open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) would make up 25% of the RFD area. This percentage is generally the same as under Alternative N. Thus, the same analysis as under Alternative N, portraying 1 well per year in the non-WSA areas (12 wells total during the 15-year RFD scenario) would be applicable for Alternative A.

The RFD scenario for oil and gas activity in RFD Area 3 predicts that during the next 15 years, approximately 49 exploratory wells (about 3 wells per year) would disturb a total of 1,100 acres (22 acres per well), and an additional 360 acres would be minimally disturbed by geophysical operations. In this RFD area, five non-WSA wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 36,800 acres of non-WSA lands with wilderness characteristics within this RFD area. All acres would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). Because well projections under Alternative A are the same as those under Alternative N, and because the same percentage of lands in the RFD area generally encompass non-WSA lands with wilderness characteristics, the same analysis (portraying two wells during the 15 year RFD scenario) would be applied.

Impacts for geophysical activities would be the same as those described under Alternative N.

Leasable Minerals—Geothermal

Impacts would be the same as those described under Alternative N.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Non-Energy Solid Leasable Minerals

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Salable Minerals

Impacts would be similar to those described under Alternative N, except that all 682,600 acres within the 29 non-WSA lands with wilderness characteristics areas would remain open to disposal of salable minerals under standard conditions or minor constraints.

Impacts from Special Designations

Wild and Scenic Rivers

Under Alternative A, no ACECs would be designated. Therefore, management prescriptions to protect relevant and important values would not be applied and would not afford protection of wilderness values in non-WSA lands with wilderness characteristics. Of all the alternatives, Alternative A would provide the lowest level of protection to non-WSA lands because no eligible river segments would be recommended for suitability.

Areas of Critical Environmental Concern

Under Alternative A, no WSR segments would be found suitable for inclusion in the NWSRS. Therefore, management prescriptions to protect the suitable river segments would not be applied and would not afford protection of wilderness values in non-WSA lands with wilderness characteristics. This alternative would provide the lowest level of protection to non-WSA lands because no ACECs are designated.

Proposed RMP

Impacts from Soil Resources and Water Resources

Impacts would be similar to those described under Alternative A for the 12 non-WSA areas (78,600 acres) managed for wilderness characteristics in the Proposed RMP. The proposed buffer zones for the protection of natural springs and maintenance or restoration of watershed health and soil productivity would improve the natural condition of these areas. However, some methods of treatment may not be consistent with the management goals and objectives for these non-WSA managed areas (VRM Class II, naturalness, solitude). Therefore, if potential impacts could not be mitigated, the long-term benefits of these types of projects may not be realized.

For the remainder of the non-WSA areas not being managed for wilderness characteristics, the impacts would be the same as those described under Alternative A.

Impacts from Vegetation

Impacts would be similar to those described under Alternative A for the protection of riparian areas except that the buffer zone would be larger. Maintenance and restoration of riparian zones, and retention of these zones in public ownership, would maintain and enhance opportunities for primitive recreation and other activities dependent upon water courses and riparian ecosystems. The non-WSA lands managed for wilderness characteristics in the Proposed RMP (78,600 acres) would be considered for Healthy Lands Initiative projects only where they improve the overall goals and objectives for managing the wilderness characteristics of these areas. As described under Alternative N, some methods of vegetation treatments, such as mechanical vegetation manipulation, would not be consistent with these management goals. Therefore, if potential impacts could not be mitigated by utilizing less surface disturbing treatment methods, the long-term benefits of these types of projects may not be realized.

For the remainder of the non-WSA areas not being managed for wilderness characteristics, the impacts would be similar to Alternative A except that the buffer zone for protection of riparian areas would be larger. The effects on the naturalness and opportunities for solitude and primitive recreation on non-WSA lands with wilderness characteristics would therefore occur on less acres as compared to Alternatives N and A.

Impacts from Cultural Resources

For the 12 non-WSA areas being managed for wilderness characteristics, the allocation of cultural sites to scientific, public, conservation, traditional and experimental uses under the Proposed RMP would increase knowledge of cultural resources and would enhance opportunities for primitive forms of recreation. Knowing more about the cultural resources of an area, interpreting the resource in an appropriate fashion, and viewing cultural resource sites in the non-WSA areas all would add to the enjoyment of these areas for primitive recreational purposes. Protection of cultural resources would add to the character of the setting and complement the management of these non-WSA lands. Depending on site location and size, some surface disturbing activities associated with the allocated uses may not be consistent with the goals and objectives of the wilderness characteristic areas. Therefore, if potential impacts could not be mitigated, the long-term benefits of inventory efforts may not be realized.

Providing Native American tribes access to managed non-WSA areas for traditional purposes might impact wilderness characteristics of these non-WSA lands. If access is provided by motorized vehicle, the noise and presence of vehicles would reduce opportunities for solitude and would conflict with primitive forms of recreation.

For the remainder of the non-WSA lands not managed for wilderness characteristics, impacts would be similar to those described above except that proposals would not be required to maintain wilderness characteristics. Management of the Bull Creek Archaeological District with major constraints (NSO) and conducting resource inventories would provide additional protection to a portion of the Mount Ellen/Blues Hills and increase knowledge of cultural resources.

Impacts from Paleontological Resources

For the 12 non-WSA areas being managed for wilderness characteristics, increased knowledge of paleontological resources through inventory, interpretation and education, and protecting significant fossils from collection or damage would add to the enjoyment of these areas for primitive recreational purposes. However, some surface disturbing activities associated with the excavation of fossil localities with significant scientific value may not be consistent with the goals and objectives of the wilderness characteristic areas. The potential for conflicts between wilderness characteristic values and excavation impacts would depend on the location and size of the paleontological resource. If potential impacts could not be mitigated, the paleontological resource would continue to be at risk from theft, erosion and/or

vandalism and require additional on-the-ground monitoring. The lack of vehicle access into the managed non-WSA areas would reduce the potential for theft of these resources. Collection of common invertebrate fossils and botanical paleontological resources for personal use, while providing a primitive recreational experience, would remove an element of the natural landscape.

For the remainder of the non-WSA areas not being proposed for management of wilderness characteristics, impacts would be similar to those described under Alternative N except that more inventories and assessments are proposed within the Proposed RMP. This would result in increased beneficial impacts through the increased knowledge, interpretation and protection of paleontological resources within these areas.

Impacts from Visual Resources

The 12 non-WSA areas being managed for wilderness characteristics would be designated as VRM Class II. Management objectives for VRM Class II would protect, preserve, and maintain the natural character of these areas (78,600 acres).

For the remainder of the non-WSA lands, not managed for wilderness characteristics, the types of impacts experienced as a result of VRM would be similar to those described under Alternative N. Under the Proposed RMP, 105,865 acres would be designated as VRM Class II in all or parts of 17 non-WSA lands with wilderness characteristics, protecting the natural character of those lands. In addition, 498,135 acres would be designated as VRM Class III or IV, possibly adversely impacting the wilderness characteristics by allowing moderate or major modification to the characteristic landscape.

Impacts from Special Status Species

For the 12 non-WSA areas being managed for wilderness characteristics (78,600 acres), impacts would be similar to those described under Alternative A. The decision to retain habitat for Federally-listed and candidate species in Federal ownership would be beneficial to management of non-WSA areas. The management prescriptions for the 12 non-WSA areas in the Proposed RMP call for the retention of public lands in federal ownership. The Special Status Species decision also provides for the exception to consider exchanges with the State of Utah of Federally-listed and candidate species habitats. This exception would not be allowed if a proposed exchange overlapped with any of these non-WSA lands.

For the remainder of the non-WSA lands with wilderness characteristics, impacts would be the same as described under Alternative A.

Impacts from Fish and Wildlife

Impacts to the 12 non-WSA areas managed for wilderness characteristics (78,600 acres) would be the same as those described under Alternative N, with the exception that habitat manipulations would be allowed to benefit bison and mule deer in the Henry Mountains bison and mule deer range. The bison and mule deer range overlays portions of Mount Ellen—Blue Hills, Ragged Mountain, and Mount Pennell non-WSA lands with wilderness characteristics areas. These habitat manipulations, depending on the method used, could impact the naturalness of the non-WSA areas and could affect the solitude and primitive recreation opportunities in these areas, especially during the time of employment. Mechanical treatments would have the most long-term impacts because of the use of motorized equipment and surface-disturbing effects of the treatment. In addition, construction of new range projects that benefit wildlife, such as water developments and fencing of riparian areas, would impair the natural character of small areas (generally less than 5 acres) in the non-WSA lands with wilderness characteristics. These types of treatments would not be consistent with the management goals for these non-WSA areas. Therefore, if potential impacts could not be mitigated by utilizing less surface disturbing methods, the long-term benefits of these types of projects may not be realized.

For the remainder of the non-WSA lands not proposed for management of wilderness characteristics, the impacts would be the same as those described above except that all methods of treatments would be available. Impacts to naturalness, solitude and primitive recreation opportunities could occur in these areas. However, there would also be beneficial impacts from improved habitat conditions in the long-term.

Impacts from Wild Horses and Burros

The Proposed RMP would have similar impacts to wilderness characteristics as would Alternative N. The Canyonlands HMA would overlap portions of the Labyrinth Canyon and Horseshoe Canyon South non-WSA lands identified in the Proposed RMP for management of wilderness characteristics. Herd size might be augmented in the Canyonlands HMA because of higher allocations of AUMs for wild burros under the Proposed RMP, which would continue or improve the opportunities for viewing of wild burros.

Impacts from Non-WSA Lands with Wilderness Characteristics

The Proposed RMP would manage the following 12 non-WSA lands with wilderness characteristics areas (78,600 acres) to preserve, protect, and maintain their wilderness characteristics:

- Dirty Devil/French Spring (6,100 acres)
- Dogwater Creek (3,100 acres)
- Horseshoe Canyon South (12,200 acres)
- Jones Bench (2,600 acres)
- Labyrinth Canyon (2,800 acres)
- Little Rockies (9,500 acres)
- Mount Ellen-Blue Hill (3,900 acres)
- Mount Pennell (4,700 acres)
- Notom Bench (8,200 acres)
- Ragged Mountain (7,900 acres)
- Red Desert (8,900 acres)
- Wild Horse Mesa (8,700 acres).

These areas would be managed by the following prescriptions:

- Designate VRM Class II
- Limit motorized use to designated routes
- Designate oil and gas leasing as open to leasing subject to major constraints (NSO)
- Establish ROW avoidance areas
- Open areas to locatable minerals entry
- Retain public lands in federal ownership
- Maintain and use existing facilities and valid existing rights
- Prohibit woodland harvest
- Make areas available for Healthy Lands Initiative.

These prescriptions would prevent surface disturbances that would degrade the natural character of the non-WSA areas, prevent surface disturbances and uses that would be incompatible with primitive recreation activities, and protect the setting needed to support the experience of solitude. As discussed in the soil and vegetation sections of this analysis, some methods for Healthy Lands Initiative treatments would not be consistent with these management goals. Therefore, if potential impacts could not be mitigated by utilizing less surface disturbing treatment methods, the long-term benefits of these types of

projects may not be realized. The remainder of the non-WSA lands with wilderness characteristics areas (604,000 acres) would be managed pursuant to other resource decisions outlined in the Proposed RMP. Direct and indirect impacts would be included within the analysis for those resources.

Impacts from Forestry and Woodland Products

Under the Proposed RMP, the 12 non-WSA areas managed for wilderness characteristics would not be available for woodland harvest. Therefore, there would be no impacts to wilderness characteristics from woodland products. Timber harvest in association with improving forest health would only be allowed if it was consistent with management goals of these non-WSA areas. Mechanical treatments would have the most long-term impacts because of the use of motorized equipment and surface-disturbing effects of the treatment. Therefore, if potential impacts could not be mitigated by utilizing less surface disturbing treatment methods, the long-term benefits of these types of projects may not be realized.

For the remaining non-WSA areas not proposed for management of wilderness characteristics, impacts would be the same as those described under Alternative A.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

ERMAs

Four of the 12 non-WSA areas (29,700 acres) identified for management of wilderness characteristics in the Proposed RMP would be located in ERMAs: Little Rockies, Red Desert, Wild Horse Mesa and Jones Bench. The Little Rockies area would be managed in a primitive, naturally appearing setting for a high probability of experiencing solitude and closeness to nature. This would be consistent with the protection of wilderness characteristic values for the non-WSA lands within the Little Rockies area. ERMAs would receive only custodial management with facilities, based on needs for resource protection and user demand. It is unlikely that such facilities would be necessary within the non-WSA management areas due to lack of motorized access. However, site-specific developments would be analyzed on a case-by-case basis and would be required to be consistent with management prescriptions of the non-WSA areas.

For the non-WSA lands not identified for management of wilderness characteristics which are located within the ERMAs (322,200 acres), impacts would be the same as those described under Alternative A.

SRMAs

Two of the proposed SRMAs would overlap eight of the 12 non-WSA areas proposed for management of wilderness characteristics in the Proposed RMP. There would be 48,900 acres of non-WSA lands within the two SRMAs within the Proposed RMP.

The 290,500 acre Dirty Devil/Robber's Roost SRMA would encompass all of the Labyrinth, Horseshoe Canyon and Dirty Devil-French Spring non-WSA areas managed for wilderness characteristics. Management of this SRMA for its primitive values would complement the proposed management for wilderness characteristics, therefore providing additional beneficial effects.

The 532,600 acre Henry Mountain SRMA would encompass all of the Mt. Ellen-Blue Hills, Mt. Pennell, Ragged Mountain, Dogwater Creek and Notom Bench non-WSA areas managed for wilderness characteristics. The Henry Mountains SRMA would have mixed management strategies for recreational opportunities. Some areas would be managed for their primitive opportunities, and some would be managed for group camping areas, developed facilities, and semi-primitive motorized recreation. It is unlikely that such facilities would be necessary within the non-WSA management areas due to lack of

motorized access. However, site-specific developments would be analyzed on a case-by-case basis and would be required to be consistent with management prescriptions for the non-WSA areas.

Some of the non-WSA areas not managed for wilderness characteristics under the Proposed RMP would be located within SRMAs which could provide some indirect protection of wilderness characteristics depending on the management objectives of the SRMA.

The Dirty Devil/Robbers Roost SRMA would encompass 122,700 acres of the remaining Dirty Devil/French Spring, Horseshoe Canyon South and Labyrinth Canyon non-WSA areas not specifically managed for wilderness characteristics. Because this SRMA would be managed for its primitive values, the wilderness characteristics of this area would be maintained and opportunities for solitude and a primitive recreation experience would be protected.

The Henry Mountains SRMA would contain 131,200 acres of the remaining non-WSA areas not specifically managed for wilderness characteristics, including all or portions of the Bull Mountain, Dogwater Creek, Mount Ellen-Blue Hills, Mount Hillers, Mount Pennell, Notom Bench, Ragged Mountain and Red Desert areas. The Henry Mountains SRMA would have mixed management strategies for recreation opportunities. Some areas would be managed for their primitive opportunities and some would be managed for group camping areas, developed facilities and semi-primitive motorized recreation. OHV activities would be limited to designated routes, temporarily affecting solitude and opportunities for primitive recreation when vehicles are in the area. Wilderness characteristics values could be compromised by construction of recreational facilities, placement of signs, and construction of trails and staging areas. However, wilderness characteristics would continue to be maintained within large areas of the Henry Mountains SRMA (because of its sheer size and interrelationship with existing WSAs and non-WSA lands managed for their wilderness characteristics).

Approximately 7,800 acres of the remaining non-WSA lands (Fremont Gorge) not specifically managed for wilderness characteristics fall within the Capitol Reef Gateway SRMA. The Capitol Reef Gateway SRMA would have mixed management strategies for recreation opportunities. Some areas would be managed for their primitive opportunities and some would be managed for group camping areas, developed facilities and semi-primitive motorized recreation. Wilderness characteristics values could be compromised by construction of recreational facilities, placement of signs, and construction of trails and staging areas. OHV activities would be limited to designated routes, temporarily affecting solitude and opportunities for primitive recreation when vehicles are in the area. However, wilderness characteristics would continue to be maintained within the immediate area of Fremont Gorge, which would be closed to OHV use. Approximately 20,100 acres of the 61,800 acre Muddy Creek/Crack Canyon non-WSA area not specifically managed for wilderness characteristics would fall within the Factory Butte SRMA. Because this SRMA promotes motorized recreation opportunities and opens a portion of the SRMA land to cross-county OHV use, that portion of the non-WSA area (less than 10% of the total Muddy Creek/Crack Canyon non-WSA area) could have a direct loss of natural condition through unrestricted OHV use. (Approximately 5,700 acres would be within the OHV Play Area Recreation Management Zone [RMZ].) Wilderness characteristics in the rest of the area would be protected by signing and protective fencing. The facilities would improve outstanding opportunities for solitude and primitive recreation, by keeping impacts from OHV use in the OHV Play Area RMZ.

Impacts from Travel Management

Under the Proposed RMP, motorized travel within the 12 non-WSA areas managed for wilderness characteristics (78,600 acres) would be limited to designated routes. In these areas, 25 miles of routes would be designated as shown in Table 4-32.

Table 4-32. OHV Route Designations in Non-WSA Lands with Wilderness Characteristics, Proposed RMP

Non-WSA Area Name	Miles of Routes
Bull Mountain – Not managed for wilderness characteristics	1.8 miles
Bullfrog Creek – Not managed for wilderness characteristics	20.7 miles
Dirty Devil/French Spring – Managed for wilderness characteristics	0.3 miles
Dirty Devil/French Spring – Not managed for wilderness characteristics	117.5 miles
Dogwater Creek – Managed for wilderness characteristics	1.4 miles
Dogwater Creek – Not managed for wilderness characteristics	0.1 miles
Fiddler Butte - Not managed for wilderness characteristics	2.1 miles
Flat Tops- Not managed for wilderness characteristics	26.2 miles
Fremont Gorge- Not managed for wilderness characteristics	11.5 miles
Horseshoe Canyon South– Managed for wilderness characteristics	4.2 miles
Horseshoe Canyon South- Not managed for wilderness characteristics	10.2 miles
Jones Bench– Managed for wilderness characteristics	0.1 miles
Jones Bench- Not managed for wilderness characteristics	1 mile
Kingston Ridge- Not managed for wilderness characteristics	6.6 miles
Labyrinth Canyon– Managed for wilderness characteristics	0 miles
Labyrinth Canyon- Not managed for wilderness characteristics	2.2 miles
Limestone Cliffs- Not managed for wilderness characteristics	14.1 miles
Little Rockies– Managed for wilderness characteristics	0.1 miles
Little Rockies- Not managed for wilderness characteristics	8.3 miles
Long Canyon- Not managed for wilderness characteristics	2 miles
Mount Ellen-Blue Hills– Managed for wilderness characteristics	0.6 miles
Mount Ellen—Blue Hills- Not managed for wilderness characteristics	30.4 miles
Mount Hillers- Not managed for wilderness characteristics	1.9 miles
Mount Pennell– Managed for wilderness characteristics	1.7 miles
Mount Pennell- Not managed for wilderness characteristics	30.8 miles
Muddy Creek/Crack Canyon- Not managed for wilderness characteristics	31.9 miles
Mussentuchit Badlands- Not managed for wilderness characteristics	0 miles
Notom Bench– Managed for wilderness characteristics	5.6 miles
Notom Bench- Not managed for wilderness characteristics	3.6 miles
Phonolite Hill- Not managed for wilderness characteristics	9.7 miles
Pole Canyon/Hunter Spring- Not managed for wilderness characteristics	12.3 miles
Ragged Mountain– Managed for wilderness characteristics	1.9 miles
Ragged Mountain- Not managed for wilderness characteristics	11.1 miles
Red Desert– Managed for wilderness characteristics	1.1 miles
Red Desert- Not managed for wilderness characteristics	29.3 miles

Non-WSA Area Name	Miles of Routes
Rock Canyon- Not managed for wilderness characteristics	1.2 miles
Rocky Ford- Not managed for wilderness characteristics	3.9 miles
Sweetwater Reef- Not managed for wilderness characteristics	3.8 miles
Wild Horse Mesa– Managed for wilderness characteristics	8.1 miles
Wild Horse Mesa- Not managed for wilderness characteristics	35 miles
Wildcat Knolls- Not managed for wilderness characteristics	0 miles
Total miles of routes in areas managed for wilderness characteristics (Proposed RMP)	**25.1**
Total miles of routes in areas not managed for wilderness characteristics from Alternative D	**429.2**

Limiting OHV use would confine to designated routes the soil and vegetation disturbance caused by motor vehicles, resulting in no additional change to the natural character of the non-WSA lands. The presence and noise of vehicles using these routes, however, would reduce visitors' opportunity to find solitude in the non-WSA areas, especially in proximity to the routes. These impacts to solitude would be short-term, while vehicles were in the area and reduce as visitors move away from the routes. Motorized uses could conflict with primitive and unconfined recreation opportunities sought in the non-WSA areas. However, the miles of routes within the non-WSA areas managed for wilderness characteristics are low and would result in minimal impacts.

OHV open areas near communities would be considered and encouraged for leasing under authority of the R&PP, to allow local management of OHV play areas. Generally, these areas would include previously disturbed areas and would be considered on a case-by-case basis. The non-WSA lands managed for wilderness characteristics do not include areas where this type of cross-country use has been occurring and such use would not be consistent with management goals and objectives of the non-WSA areas.

In the remainder of the non-WSA lands not managed for wilderness characteristics, there would be 5,700 acres designated as open (Factory Butte Play Area), 564,050 acres limited to designated routes and 34,250 acres closed to motorized use. The Proposed RMP would designate four areas to be managed as open OHV play areas; including 5,700 acres within the Muddy Creek/Crack Canyon non-WSA lands with wilderness characteristics area. Cross-country motorized travel in these non-WSA lands would continue to result in surface disturbance to soils and vegetation, altering the landscape and diminishing the natural character of these non-WSA lands. Further, the presence and noise of motorized vehicles would degrade visitors' opportunity for solitude and would conflict with opportunities for primitive and unconfined recreation activities. The Factory Butte Play Area would be within the Factory Butte SRMA (24,400 acres). Management prescriptions for the SRMA (Appendix 18), establish Recreation Management Zones to accommodate various user groups. Educating visitors of these motorized and non-motorized opportunities would reduce conflicts and continue to provide non-motorized opportunities within the Landmarks RMZ.

Under the Proposed RMP, OHV use would be limited to designated routes in 564,050 acres (93%) of the remaining non-WSA lands with wilderness characteristics. In these areas, 25.1 miles of routes would be designated as shown in Table 4-32.

Limiting OHV use would confine to designated routes the soil and vegetation disturbance caused by motor vehicles, resulting in no additional change to the natural character of the non-WSA lands. The

presence and noise of vehicles using these routes, however, would reduce visitors' opportunity to find solitude in these areas, especially in proximity to the routes. These impacts to solitude would be short-term, while vehicles were in the area and reduce as visitors move away from the routes. Motorized uses would conflict with primitive and unconfined recreation opportunities sought in these non-WSA areas.

Under the Proposed RMP, motor vehicles would be allowed to pull off of a designated route as far as 50 feet to either side of the centerline (for parking/staging). Motor vehicles would be allowed to use existing spur routes for ingress and egress to established campsites within 150 feet of the centerline of designated routes but would be prohibited from traveling between multiple campsites, establishing motorized play areas and race tracks, or traveling across wet meadows or riparian areas. These actions would allow for parking and camping while confining the area in which soil and vegetation disturbance would occur, resulting in limited change to the natural character of the non-WSA lands.

The Proposed RMP would designate as closed to OHV use 34,250 acres (6%) within 5 of the non-WSA areas not proposed for management of wilderness characteristics (Table 4-33).

Table 4-33. Acres Closed to OHVs in Non-WSA Lands Not Proposed for Management of Wilderness Characteristics in the Proposed RMP

Non-WSA Area Name	Acres Closed
Dirty Devil/French Spring	27,500 acres
Fremont Gorge	1,500 acres
Horseshoe Canyon South	100 acres
Labyrinth Canyon	50 acres
Mount Ellen—Blue Hills	400 acres
Muddy Creek/Crack Canyon	4,700 acres

Some of these non-WSA lands with wilderness characteristics areas are located in SRMAs that are being managed for primitive and unconfined recreational experiences. Other areas as closed because of other resource management decisions.

Because these areas would be closed, no routes would be designated; surface disturbance caused by motorized travel and the resultant impacts to the natural character of the non-WSA areas would not occur. Further, the opportunities for conflict between primitive forms of recreation and motorized uses in these areas would not occur. The natural character and opportunities for solitude and primitive recreation of these non-WSA areas would be unaffected by OHV travel.

OHV open areas near communities would be considered and encouraged for leasing under authority of the R&PP, to allow local management of OHV play areas. Generally, these areas would include previously disturbed areas and would be considered on a case-by-case basis. If an R&PP open area was leased and overlapped non-WSA areas, the action would continue to degrade the natural character of the non-WSA lands with wilderness characteristics, by allowing the surface-disturbing activity from motorized vehicles to continue. The action would also conflict with solitude and primitive recreation experiences because of the sights and sounds of vehicle travel.

Impacts from Lands and Realty

Land Tenure Adjustments

There would be no impacts to the 12 non-WSA areas managed for wilderness characteristics (78,600 acres) from land tenure adjustments. There are no parcels within these areas that have been identified for FLPMA Section 203 sales. Furthermore, the management objectives for the non-WSA lands include retaining the public lands in Federal ownership.

Impacts within the remaining non-WSA areas not proposed for management of wilderness characteristics would be the same as those described under Alternative A. Three parcels (600 acres) of land in the Notom Bench, Red Desert and Dogwater Creek non-WSA areas not managed for wilderness characteristics would be available for FLPMA Section 203 sales: One parcel in the Notom Bench area (80 acres), one parcel in the Red Desert area (160 acres), and one parcel in the Dogwater Creek area (360 acres). All three parcels are interspersed with private lands adjoining the Capitol Reef National Park boundary. Disposal of these lands would take them out of public ownership and allow for development and surface disturbing activities out of BLM's control. The wilderness characteristics could be foregone because the lands would no longer be under BLM control.

Withdrawals

No withdrawals are proposed within the 12 non-WSA areas managed for wilderness characteristics (78,600) acres. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. As of May 2007, there have been no surface disturbing actions within these non-WSA lands from recent mining related activity.

Within the remaining non-WSA lands not managed for wilderness characteristics, portions of two non-WSA areas would be recommended for withdrawal from mineral entry: Fremont Gorge (1,500 acres) for the protection of the Fremont Gorge Wild and Scenic River Segment, and Muddy Creek/Crack Canyon (2,200 acres) for the protection of the North Caineville ACEC. These 3,700 acres comprise less than 1% of all non-WSA lands. The withdrawal would continue to preserve the naturalness and opportunities for both solitude and primitive forms of recreation in each of these areas, by preventing mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining. Wilderness characteristics would be preserved, and naturalness would not be impacted because mining activities would be precluded on these lands. The remaining non-WSA lands not managed for wilderness characteristics, which would be open to mineral entry, would have the same impacts as those described under Alternative N.

Rights-of-Way and Other Land Use Authorizations

Within the Proposed RMP, management decisions for the 12 non-WSA units being managed for wilderness characteristics would make these right-of-way avoidance areas. These areas are to be avoided but may be available for location of rights-of-ways with special stipulations if the proposal meets the goals and objectives of other resources and uses in the land use plan. It is expected and assumed that the avoidance areas would protect, preserve, and maintain the natural character of the non-WSA lands managed for wilderness characteristics.

Three of the 12 non-WSA units being managed for wilderness characteristics are located adjacent to current rights-of-way. Two proposed right-of-way corridors which would be 800 feet wide (400 feet on each side of the centerline) occur along the exterior boundaries of the Red Desert and Little Rockies managed areas. The proposed State Highway 24 right-of-way corridor would occur adjacent to the Red Desert managed area. The boundary for this unit was adjusted to exclude the existing powerline, plus a 1,000 foot buffer for future use and expansion. The proposed State Highway 276 right-of-way corridor

would be adjacent to the Little Rockies managed area. The boundary for the Little Rockies managed area is also offset from the Highway and the opposite side of Highway 276 does not include managed non-WSA lands. The Notom Bench unit is adjacent to the Notom Road and existing powerline right-of-way. The boundary of the unit was adjusted to exclude the existing powerline, plus a 1,000 foot buffer for future use and expansion. Maintenance and use of these existing facilities have not impacted the natural condition of these areas and these uses would continue. Placement of future utility rights-of-way within these corridors could impact the wilderness characteristics along the exterior boundaries. The extent of the impact would vary depending upon the type of facilities proposed. The future use of these rights-of-way along the boundary would not be expected to impact the area as a whole.

The 12 non-WSA units being managed for wilderness characteristics would be available for other land use authorizations (such as film permits, leases and easements) if the use associated with this authorization is compatible with other decisions throughout the RMP. Activities would be analyzed on a case-by-case basis and must be in conformance with the goals and objectives of the non-WSA lands, i.e. naturalness, OHV area designation, VRM management class.

Within the remaining non-WSA lands not managed for wilderness characteristics in the Proposed RMP, two proposed right-of-way corridors which would be 800 feet wide (400 feet on each side of the centerline) would overlay slivers of the exterior boundaries of six non-WSA lands with wilderness characteristics areas. The proposed State Highway 24 right-of-way corridor would overlay the Wild Horse Mesa, Red Desert and Fremont Gorge non-WSA lands with wilderness characteristics. The proposed State Highway 62 right-of-way corridor would overlay slivers of Rocky Ford, Phonolite Hill, and Kingston Ridge non-WSA lands with wilderness characteristics. Placement of future utility rights-of-way within these corridors could impact the wilderness characteristics along the exterior boundaries by creating surface disturbing activities (and possibly placing surface facilities) that would no longer maintain the wilderness characteristics values in those linear corridors. The extent of the impact would vary depending upon the type of facilities proposed.

Under the Proposed RMP, 63,103 acres in six non-WSA lands with wilderness characteristics not proposed for management of wilderness characteristics areas would be protected in part from surface-disturbing activities because they would be within ROW avoidance/exclusion areas (Table 4-34). These areas would be avoided but might be available for location of ROWs with special stipulations if the proposal met the goals and objectives of other resources and uses in the LUP. It is expected and assumed that the avoidance areas would protect the natural character of the non-WSA lands in these areas.

Table 4-34. Acres of Avoidance/Exclusion for Rights-of-Way in Non-WSA Lands Not Managed for Wilderness Characteristics in the Proposed RMP

Name of Non-WSA Land with Wilderness Characteristics	Proposed RMP
Dirty Devil/French Spring	57,500
Flat Tops	3
Fremont Gorge	1,500
Horseshoe Canyon South	1,500
Mount Ellen/Blue Hills	300
Muddy Creek/Crack Canyon	3,800
Total Acres of Avoidance Areas	**64,603**

Non-WSA lands not managed for wilderness characteristics that would remain available for granting of ROWs include all of 18 areas and portions of 6 areas, totaling 539,397 acres. Any surface-disturbing

activity or placement of permanent visible facilities would detract from the natural character of the area and disrupt the setting needed to support primitive forms of recreation.

Impacts to non-WSA lands not managed for wilderness characteristics from issuance of other land use authorizations would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

There would be no impact to the 12 non-WSA lands with wilderness characteristics managed for wilderness characteristics (78,600 acres) from oil and gas leasing or geophysical exploration activities. The lands would be open to leasing subject to major constraints (NSO).

Lands open to leasing within the remaining non-WSA lands with wilderness characteristics are listed in Table 4-28. There are 604,000 acres of non-WSA lands with wilderness characteristics within the RFD areas that would not be managed for wilderness characteristics. Exploration and development activities could impact wilderness characteristics through the direct disturbance of the natural terrain and consequently impact solitude and opportunities for primitive recreation. Under the Proposed RMP, 142,500 acres, 21% of the non-WSA lands with wilderness characteristics not managed for wilderness characteristics would be open to leasing subject to major constraints (NSO) on the future leases or closed to leasing. If developed, there could be impacts to wilderness characteristics from current leases. There would be no impact to wilderness characteristics from oil and gas activities within these areas from future leases. The remaining non-WSA lands with wilderness characteristics not managed for wilderness characteristics areas (540,100 acres) would remain open to leasing and exploration and development as open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). This acreage comprises about 79% of non-WSA lands with wilderness characteristics in the RFD areas. In RFD Areas 1 and 2, 438,800 acres of the total 604,000 acres of the non-WSA wilderness lands with wilderness characteristics areas not being managed for wilderness characteristics would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). The other 84,700 acres are either closed to leasing or open to leasing subject to major constraints (NSO): 61,300 acres in Dirty Devil/French Spring (46% of the total of this non-WSA lands with wilderness characteristics area); 1,500 acres in Fremont Gorge (9%); 3,600 acres in Horseshoe Canyon South (17%); 2,300 acres in Mount Ellen—Blue Hills (5%); 1,300 acres in Mount Hillers (72%); 2,300 acres in Mount Pennell (4%); and 3,800 acres in Muddy Creek/Crack Canyon (6%). It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be compatible with other resource goals and objectives in these areas.

The Flat Tops and Dirty Devil/French Spring non-WSA lands with wilderness characteristics areas have the greatest percentage of lands leased at this time. Given that the projection for drilling for oil and gas is 3 wells per year for the entire RFD area, and that the non-WSA lands with wilderness characteristics that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) make up 21% of the RFD area, 1 well per year—or 15 wells during a 15-year period—could be drilled within any of these open non-WSA areas. Because well projections under the Proposed RMP are the same as under Alternative N, and because the same percentage of lands in the RFD area generally encompass non-WSA lands with wilderness characteristics under both alternatives, the same analysis would be applied: 1 well per year in this area, or 12 wells during the 15-year RFD scenario. However, one difference under the Proposed RMP is that about half of the acreage for Dirty Devil/French Spring and about 72% of the Mount Hillers non-WSA areas would be closed to leasing or open to leasing subject to major constraints (NSO). This management for the protection of other resources would indirectly protect these non-WSA areas from surface-disturbing activities associated with oil and gas

activities. Therefore, wilderness characteristics values of naturalness and outstanding opportunities for solitude and primitive recreation would be preserved in these areas.

In RFD Area 3, all five non-WSA areas not managed for wilderness characteristics would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). Because well projections under the Proposed RMP are the same as under Alternative N, and because the same percentage of lands in the RFD area generally encompass these non-WSA lands with wilderness characteristics under both alternatives, the same analysis would be applied: Two wells over the 15-year RFD scenario.

The types of impacts for geophysical activities would be the same as those described under Alternative N. Geophysical exploration activities would be authorized for all non-WSA areas not managed for wilderness characteristics, subject to the oil and gas leasing categories identified above.

Leasable Minerals—Geothermal

None of the 12 Non-WSA lands (78,600 acres) being managed for wilderness characteristics in the proposed RMP would be impacted by Geothermal leasing. The lands would be open to leasing subject to major constraints (NSO); however, these areas do not have high potential for geothermal resources. Geothermal resources are subject to the oil and gas leasing restrictions with some exceptions. It is assumed that the exceptions would likely not be granted because the activities would not be compatible with other resource goals and objectives in these areas.

About two-thirds of the Kingston Ridge non-WSA lands which are not proposed for management protection of wilderness characteristics overlie a high potential area for geothermal resources. Impacts to the Kingston Ridge Non-WSA unit (10,200 acres) would be the same as described under Alternative N.

Leasable Minerals—Coal

Of the 12 Non-WSA units being managed for wilderness characteristics under the Proposed RMP, portions of Mount Pennell, Mount Ellen/Blue Hills and Wildhorse Mesa are likely to contain surface and subsurface coal. Other Non-WSA units not being managed for wilderness characteristics which may overlie mineable coal are Limestone Cliffs and Rock Canyon. Impacts to wilderness characteristics in these Non-WSA units would be the same as described under Alternative N.

Non-Energy Solid Leasable Minerals

Of the 12 Non-WSA units being managed for wilderness characteristics under the Proposed RMP, portions of Labyrinth Canyon. Horseshoe Canyon South and Dirty Devil/French Springs contain the highest potential for sodium or potassium occurrence. Impacts to wilderness characteristics in these Non-WSA units would be the same as described under Alternative N.

Locatable Minerals

Under the Proposed RMP, the 12 Non-WSA units being managed for wilderness characteristics will be open to locatable mineral entry. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. Impacts would be the same as described under Alternative N.

Salable Minerals

None of the 12 Non-WSA lands (78,600 acres) being managed for wilderness characteristics in the Proposed RMP would be impacted by Salable Minerals. These lands would have NSO stipulations to salable mineral disposal. It is assumed that the various waivers, exceptions, and modifications under the

NSO stipulation would not be granted because they would not be compatible with other resource goals and objectives in these areas.

For the remaining non-WSA lands not being managed for wilderness characteristics, impacts would be similar to those described under Alternative N. These areas would remain open to salable mineral disposal under standard conditions or minor constraints. Where surface disturbance would occur, naturalness and opportunities for primitive recreation and solitude would be foregone.

Impacts from Special Designations

Wild and Scenic Rivers

Under the PRMP/FEIS, five miles of the Fremont River is designated as suitable for inclusion in the Wild and Scenic Rivers System with a tentative classification of Wild. This five mile segment passes through the Fremont Gorge Non-WSA lands with wilderness characteristics which are not being managed for wilderness characteristics. The protective management for the Wild and Scenic River segment to preserve its outstanding remarkable values would limit or prevent uses and surface disturbances that would detract from the natural character of the Fremont Gorge Non-WSA lands within the wild and scenic river corridor. Protection of river values would prevent uses and surface disturbances that would detract from the natural character of the Fremont Gorge non-WSA lands with wilderness characteristics within the half-mile river corridor (one-quarter mile from the high water mark on each bank of the river segment).

Areas of Critical Environmental Concern

Under the Proposed RMP, none of the 12 non-WSA lands being managed for wilderness characteristics are located in the areas where the Proposed RMP would designate ACECs. A portion (2,200 acres) of the Muddy Creek/Crack Canyon non-WSA lands with wilderness characteristics area lies within the 2,200 acre potential North Caineville Mesa ACEC. This non-WSA area would not be managed for wilderness characteristics but would benefit indirectly from the ACEC designation. As a result of the management prescriptions for the ACEC, these non-WSA lands with wilderness characteristics would be closed to OHV use, open to leasing subject to major constraints (NSO), unavailable for livestock grazing, identified as unsuitable for surface coal mining, identified to acquire inholdings from willing sellers, and recommended for withdrawal from mineral entry. These prescriptions would prevent surface disturbances, limit motorized uses, and protect the natural character and opportunities for solitude and primitive recreation of the non-WSA lands with wilderness characteristics.

Alternative C

Impacts from Soil Resources and Water Resources

Impacts would be similar to those described under Alternative N, except that no surface disturbance or occupancy would be permitted within 660 feet of natural springs, to protect water quality and riparian vegetation. The effects on the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would therefore occur on fewer acres under Alternative C, compared to Alternative N or A or the Proposed RMP.

Impacts from Vegetation

Impacts would be similar to those described under Alternative N, except that no surface disturbance or occupancy would be permitted within approximately 660 feet (based on geo-hydrological, riparian, and other factors) of natural springs to protect riparian vegetation. The effects on the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would therefore occur on fewer acres under Alternative C, compared to Alternative N or A or the Proposed RMP.

Alternative C proposes to treat an average of 26,000 acres of vegetation annually, using only natural processes. The types of impacts that natural vegetation treatments methods would have on naturalness and opportunities for solitude and primitive recreation of the non-WSA lands with wilderness characteristics as would be similar to those described under Alternative N, although less potential area would be affected under Alternative C. Applied over time, Alternative C would not result in enough disturbance to support disturbance-based ecosystems.

Impacts from Cultural Resources

Impacts would be the same as those described under the Proposed RMP.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM would be similar to those described under Alternative N. Under Alternative C, 163,765 acres would be designated as VRM Class I or II in all or parts of 18 non-WSA lands with wilderness characteristics areas, protecting the natural character of those lands. Conversely, 518,835 acres would be designated as VRM Class III or IV, possibly adversely impacting the wilderness characteristics because the objectives of these classes would allow moderate or major modification to the landscape.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as described under Alternative A, with the exception that habitat manipulations to benefit bison and mule deer would use only prescribed fire and biological methods, thereby continuing to protect the naturalness of the non-WSA areas and the opportunities for solitude and primitive recreation. Construction of new range projects that would benefit wildlife could impair the natural character of small areas (generally less than 5 acres) in the non-WSA lands with wilderness characteristics. Such projects could include water developments and fencing of riparian areas.

Under Alternative C 8,200 acres in the Mount Ellen—Blue Hills non-WSA area and 25,400 acres in the Ragged Mountain non-WSA area would be closed to OHV use, to protect crucial bison habitat. This closure would help to maintain the opportunities for solitude and primitive recreation within the non-WSA lands with wilderness characteristics.

Impacts from Wild Horses and Burros

The types of impacts experienced as a result of wild horse and burro management would be similar to those described under the Proposed RMP, except that herd size would be doubled (as would AUM allocations) in the Canyonlands HMA. This management would provide greater opportunities for viewing wild burros, possibly enhancing primitive recreation experiences.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative C, no specific actions would be prescribed to directly protect the naturalness and opportunities for solitude or primitive recreation of the non-WSA areas, resulting in no specific benefits to non-WSA lands.

Impacts from Forestry and Woodland Products

Alternative C would preclude commercial timber harvest within all non-WSA lands with wilderness characteristics, so impacts associated with these activities would not occur in the non-WSA lands. However, commercial and non-commercial use of forest and woodland products and commercial live plant and seed collection would continue to be allowed on all non-WSA lands with wilderness characteristics. Impacts associated with such permitted activities would be the same as those described under Alternative A.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

ERMAs

Impacts would be the same as those described under Alternative A.

SRMAs

Three of the proposed SRMAs would overlap portions of 14 non-WSA lands with wilderness characteristics areas. There would be 327,560 acres (or 48%) of non-WSA lands within the three SRMAs.

The Dirty Devil/Robbers Roost SRMA would be managed the same as under Alternative A, except that an additional 16,930 acres within the Fiddle Butte non-WSA lands with wilderness characteristics would be incorporated into the SRMA. The subsequent analysis of impacts and protection of the non-WSA lands would be the same as under Alternative A, although the acreage would be augmented.

Under Alternative C, management of the Capitol Reef Gateway SRMA would be different than under the Proposed RMP, in that the interior of the SRMA would be managed to protect its naturalness and primitive recreation opportunities under Alternative C. The 7,770 acres of the Fremont Gorge non-WSA lands with wilderness characteristics that fall within this SRMA would be complemented by this management. The wilderness characteristics values of these non-WSA lands would be protected.

The 533,900 Henry Mountains SRMA would have mixed management strategies for recreational opportunities, as the SRMA would under the Proposed RMP. The same non-WSA lands and acreage would overlap this SRMA under both alternatives, and the same general management would be prescribed. Therefore, the same impacts described for the Proposed RMP would be applicable under Alternative C.

Impacts from Travel Management

Under Alternative C, no non-WSA lands with wilderness characteristics would be designated as open for cross-country travel. OHV use would be limited to designated routes in 473,100 acres (69%) of the 29 non-WSA lands with wilderness characteristics areas. In these areas, 99.7 miles of routes would be designated (Table 4-35).

Table 4-35. OHV Route Designations in Non-WSA Lands with Wilderness Characteristics, Alternative C

Non-WSA Area Name	Miles of Routes
Bull Mountain	0.5 miles
Bullfrog Creek	6.6 miles

Non-WSA Area Name	Miles of Routes
Dirty Devil/French Spring	13.3 miles
Dogwater Creek	0.1 miles
Fiddler Butte	0 miles
Flat Tops	7.5 miles
Fremont Gorge	11.3 miles
Horseshoe Canyon South	0 miles
Jones Bench	0 miles
Kingston Ridge	2.6 miles
Labyrinth Canyon	0 miles
Limestone Cliffs	14 miles
Little Rockies	3.9 miles
Long Canyon	2 miles
Mount Ellen—Blue Hills	2.2 miles
Mount Hillers	0 miles
Mount Pennell	1.8 miles
Muddy Creek/Crack Canyon	2.7 miles
Mussentuchit Badlands	0 miles
Notom Bench	0.8 miles
Phonolite Hill	8.2 miles
Pole Canyon/Hunter Spring	9.6 miles
Ragged Mountain	1.1 miles
Red Desert	1.6 miles
Rock Canyon	1.2 miles
Rocky Ford	2.3 miles
Sweetwater Reef	2.8 miles
Wild Horse Mesa	3.6 miles
Wildcat Knolls	0 miles

Limiting OHV use would confine to designated routes the soil and vegetation disturbance caused by motor vehicles, resulting in no additional change to the natural character of the non-WSA lands. However, the presence and noise of vehicles using these routes would reduce visitors' opportunity to find solitude in the non-WSA areas, especially in proximity to the routes. Motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA areas.

Under Alternative C, motor vehicles would be allowed to pull off of a designated route as far as 25 feet to either side of the centerline (for parking/staging). Campsites would be designated for motor vehicle use, where compatible with other resources and resource uses. Motorized travel between multiple campsites, establishment of motorized play areas or race tracks, and travel across wet meadows or riparian areas would be prohibited. These actions would allow for parking and camping while confining the area in

which soil and vegetation disturbance would occur, resulting in limited change to the natural character of the non-WSA lands.

Alternative C would designate as closed to OHV use 209,500 acres (31%) within 12 of the 29 non-WSA lands with wilderness characteristic areas (Table 4-36).

Table 4-36. Acres Closed to OHVs in Non-WSA Lands with Wilderness Characteristics, Alternative C

Non-WSA Area Name	Acres Closed
Dirty Devil/French Spring	60,000 acres
Fiddler Butte	12,000 acres
Fremont Gorge	6,700 acres
Horseshoe Canyon South	2,900 acres
Limestone Cliffs	400 acres
Little Rockies	3,600 acres
Mount Ellen—Blue Hills	8,200 acres
Mount Pennell	45,300 acres
Muddy Creek/Crack Canyon	20,200 acres
Ragged Mountain	25,400 acres
Wild Horse Mesa	24,500 acres
Wildcat Knolls	300 acres

Because these areas would be closed, no routes would be designated; surface disturbance caused by motorized travel (and the resultant impacts to the natural character of the non-WSA areas) would not occur. Furthermore, the opportunities for conflict between primitive forms of recreation and motorized uses in these areas would not occur. The natural character and opportunities for solitude and primitive recreation of these non-WSA areas would be unaffected by OHV travel.

Under Alternative C, requests for R&PP leases for OHV open play areas would not be considered, and use of game carriers would not be allowed off of designated routes. These actions would protect the natural character of the non-WSA lands with wilderness characteristics because no new surface-disturbing activity from motorized vehicles would be allowed.

Impacts from Lands and Realty

Land Tenure Adjustments

Impacts would be similar to those described under Alternative N. No lands would be considered for FLPMA Section 203 sales under Alternative C.

Withdrawals

Portions of 12 non-WSA lands with wilderness characteristics would be recommended for withdrawal from mineral entry: Dirty Devil/French Spring (34,100 acres), Fiddler Butte (10,800 acres), Fremont Gorge (3,400 acres), Little Rockies (11,600 acres), Mount Ellen—Blue Hills (6,200 acres), Mount Hillers (1,200 acres), Mount Pennell (11,400 acres), Muddy Creek/Crack Canyon (14,300 acres), Ragged Mountain (15,700 acres), Red Desert (600 acres), Wild Horse Mesa (1,600 acres), and Wildcat Knolls

(100 acres). These 110,900 acres that would be recommended for withdrawal from mineral entry comprise 16% of all non-WSA lands with wilderness characteristics. The withdrawal would continue to preserve the naturalness and opportunities for both solitude and primitive forms of recreation in each of these areas by preventing mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining. Wilderness characteristics would be preserved, and naturalness would not be impacted because mining activities would be precluded on these lands. The other 84% of non-WSA lands, which would be open to mineral entry, would have the same impacts as described under Alternative N.

Rights-of-Way and Other Land Use Authorizations

Impacts from ROW corridors would be the same as those described under Alternative A.

Non-WSA lands with wilderness characteristics that would remain available for granting of ROWs would include all of 6 areas and portions of 22 areas, totaling 370,432 acres. Any surface-disturbing activity or placement of permanent facilities would detract from the natural character of the area and disrupt the setting needed to support primitive forms of recreation.

Under Alternative C, 312,168 acres in 23 non-WSA lands with wilderness characteristics areas would be protected, in whole or in part, from surface-disturbing actives because they would be within ROW avoidance areas (Table 4-27). All or portions of the Bull Mountain, Dirty Devil/French Spring, Dogwater Creek, Fiddler Butte, Flat Tops, Fremont Gorge, Horseshoe Canyon South, Jones Bench, Kingston Ridge, Labyrinth Canyon, Limestone Cliffs, Little Rockies, Mount Ellen—Blue Hills, Mount Hillers, Mount Pennell, Muddy Creek/Crack Canyon, Notom Bench, Phonolite Hill, Ragged Mountain, Red Desert, Rocky Ford, Wild Horse Mesa, and Wildcat Knolls non-WSA lands with wilderness characteristics would be within the ROW avoidance areas. These areas would be avoided but might be available for location of ROWs with special stipulations, if the proposal met the goals and objectives of other resources and uses in the LUP. It is expected and assumed that the avoidance areas would protect the natural character of the non-WSA lands in these areas.

Impacts from issuance of other land use authorizations would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to leasing within non-WSA lands with wilderness characteristics are listed in Table 4-28. Exploration and development activities could impact wilderness characteristics through the direct disturbance of the natural terrain and consequently would impact opportunities for primitive recreation and solitude. Under Alternative C, 69% of non-WSA lands would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) and 31% would be open to leasing subject to major constraints (NSO) or closed to leasing. The types of impacts experienced as a result of oil and gas activities would be the same as those described under Alternative N.

All or portions of 27 non-WSA lands with wilderness characteristics areas would remain open to leasing and development as open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 682,600 acres of non-WSA lands with wilderness characteristics within the RFD areas. Of these, 469,200 acres are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). This acreage comprises about 69% of non-WSA areas. Thirty-one percent (213,700 acres) of the non-WSA lands with wilderness characteristics spread among 18 areas would be open to leasing subject to major constraints (NSO) on the future leases or closed to leasing. Two of those non-WSA areas (Dogwater Creek and

Notom Bench) would be completely closed to leasing, thus fully protecting the wilderness characteristics values from surface disturbance associated with oil and gas exploration and development.

In RFD Areas 1 and 2, all or portions of 22 non-WSA land with wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). There are 645,800 acres of non-WSA lands with wilderness characteristics within the combined RFD areas. Of these, 432,600 acres in 16 non-WSA areas would be open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). The remaining 213,200 acres would be closed to leasing or open to leasing subject to major constraints (NSO): 62,500 acres in Dirty Devil/French Spring (47% of this non-WSA area); 3,500 acres in Dogwater Creek (100%); 17,300 acres in Fiddler Butte (88%); 3,000 acres in Fremont Gorge (19%); 3,300 acres in Horseshoe Canyon South (16%); 15,600 acres in Little Rockies (67%); 17,800 acres in Mount Ellen—Blue Hills (36%); 1,100 acres in Mount Hillers (61%); 17,900 acres in Mount Pennell (27%); 17,700 acres in Muddy Creek/Crack Canyon (29%); 8,000 acres in Notom Bench (100%); 1,000 acres in Phonolite Hill (13%); 15,400 acres in Ragged Mountain (59%); 2,300 acres in Red Desert (6%); 400 acres in Rocky Ford (6%); and 26,400 acres in Wild Horse Mesa (53%). These non-WSA lands that are open to leasing subject to major constraints (NSO) or closed to leasing comprise approximately 33% of the non-WSA lands with wilderness characteristics in this combined RFD area. It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be compatible with other resource goals and objectives in these areas.

At this time, the Flat Tops and Dirty Devil/French Spring non-WSA lands with wilderness characteristics areas would have the greatest percentage leased. Given that the projection for drilling for oil and gas is 3 wells per year for the entire RFD area, and that the non-WSA lands with wilderness characteristics that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU) make up 17% of the RFD area, one well per year—or 15 wells over a 15-year period—could be drilled within the 22 non-WSA areas that are open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU). Although well projections under Alternative C are the same as those under Alternative N, 8% fewer non-WSA lands are available for oil and gas surface occupancy under Alternative C. Thirty-three percent of the non-WSA areas would be protected from surface-disturbing activities associated with oil and gas exploration and development, thereby preserving the naturalness and outstanding opportunities for solitude and primitive recreation in these areas. Sixty-six percent of the lands would be available for oil and gas exploration and development. However, this area has a low activity level (development potential); the same analysis as under Alternative N would be applied in these non-WSA areas: 1 well per year, or 12 wells during the 15-year RFD scenario. However, one difference under Alternative C is that two areas would be completely protected because they would be closed to leasing, and five areas would have well over 50% of their acreage protected.

In RFD Area 3, all of five non-WSA lands with wilderness characteristics areas would remain open to leasing subject to the standard terms and conditions or open to leasing subject to moderate constraints (TL, CSU), with the exception of 200 acres in Wildcat Knolls that would be closed to leasing. Because well projections under Alternative C would be the same as under Alternative N, and because the same percentage of lands in the RFD area would generally encompass non-WSA lands with wilderness characteristics under both alternatives, the same analysis (two wells during the 15-year RFD scenario) would be applicable.

Impacts for geophysical activities would be the same as those described under Alternative N.

Leasable Minerals—Geothermal

Impacts would be the same as described those described under Alternative N.

Leasable Minerals—Coal

Under Alternative C, 9,270 acres of non-WSA lands with wilderness characteristics, underlain by coal resources suitable for leasing, would be closed to leasing. This acreage includes 8,120 acres within the Mount Pennell non-WSA area (1,690 acres identified for surface mining; 6,430 acres identified for subsurface mining) and 1,150 acres within the Mount Ellen—Blue Hills non-WSA area (610 acres identified for surface mining; 540 acres identified for subsurface mining). All other non-WSA areas with coal resources suitable for leasing could be leased and mined, pending a leasing EIS and further analysis. If leased, 3,230 acres in Mount Ellen—Blue Hills; 4,320 acres in Mount Pennell; and 82 acres in Wild Horse Mesa non-WSA lands could be available for leasing by surface mining methods. Surface mining for the coal resources would entail strip mining operations. Impacts to the wilderness characteristics values would be the same as those described under Alternative N or A or the Proposed RMP. As much as 6% of the Mount Ellen—Blue Hills non-WSA area, as much as 7% of the Mount Pennell non-WSA area, and less than 1% of the Wild Horse Mesa non-WSA area could forego their wilderness characteristics if the total surface coal resource was mined.

In addition to the surface coal resource, both Mount Pennell and Mount Ellen—Blue Hills have subsurface coal resources found suitable for mining. If leased, an additional 4,440 acres in the Mount Ellen—Blue Hills and 18,770 acres in Mount Pennell non-WSA lands could be available for leasing by subsurface mining methods. In the Emery coal field, underground coal resources suitable for leasing by underground mining methods encompass 3,970 acres in the Limestone Cliffs and 64 acres in the Rock Canyon non-WSA lands with wilderness characteristics. The same impacts for subsurface mining described under Alternative N would occur in areas available for coal leasing under Alternative C.

Exploration activities for coal resources could be authorized within any of the non-WSA lands with wilderness characteristics. These activities could include the use of cross-county travel with drilling rigs and field crews, for not more than 2 years, in an identified area. This activity could cause tracks from motorized use, crushed vegetation and compacted soil, and other surface disturbances. Pad construction might be an outcome from deep drilling. This disturbance would be temporary and reclamation would be required. However, during the time that the exploratory activities were occurring, opportunities for solitude and primitive recreation would be affected in the short term, and naturalness would be impacted until the area was reclaimed.

Non-Energy Solid Leasable Minerals

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Salable Minerals

Impacts would be similar to those described under Alternative N, except that all or portions of 27 non-WSA lands with wilderness characteristics areas would remain open to salable mineral disposal under standard conditions or minor constraints. Of the 682,600 acres of non-WSA lands with wilderness characteristics, 469,200 acres would be open under standard terms or minor constraints. This acreage comprises about 69% of non-WSA areas.

Thirty-one percent (213,700 acres) of non-WSA lands with wilderness characteristics spread among 18 areas would have a NSO stipulation on the future leases, or would be closed to leasing. It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be compatible with other resource goals and objectives in these areas. Two of the non-WSA areas (Dogwater Creek and Notom Bench) would be completely closed to leasing, thus fully

protecting the wilderness characteristics values from surface disturbance associated with mineral material disposal.

Impacts from Special Designations

Wild and Scenic Rivers

Under Alternative C, 4 of the 29 non-WSA lands with wilderness characteristics areas would intersect with suitable WSR segments, totaling 33.35 miles in those 4 areas. Under this alternative, 19.31 miles of Dirty Devil River, 0.12 miles of No Man's Canyon, 2.83 miles of Robbers Roost Canyon, 0.13 miles of Sam's Mesa Box Canyon, 1.39 miles of Twin Corral Box Canyon, 5 miles of Fremont River (Fremont Gorge), 3.26 miles of Fremont River (Capitol Reef National Park to Caineville Ditch Diversion), and 1.4 miles of Maidenwater Creek would be managed to preserve WSR suitability. Protection of river values would prevent uses and surface disturbances that would detract from the natural character of the Dirty Devil/French Spring, Fremont Gorge, Red Desert, and Little Rockies non-WSA lands with wilderness characteristics areas within the half-mile river corridor (one-quarter mile of the high water mark on each bank of the river segment).

Areas of Critical Environmental Concern

Under Alternative C, 16 ACECs would be designated to protect a variety of relevant and important values; 11 of those ACECs would overlay non-WSA lands with wilderness characteristics. Those ACECs are Badlands, Bull Creek, Dirty Devil, Fremont Gorge/Cockscomb, Henry Mountains, Horseshoe Canyon, Kingston Canyon, Little Rockies, Lower Muddy Creek, Quitchupah, and Thousand Lakes Bench. The management prescriptions for these ACECs would protect naturalness and opportunities for solitude and primitive recreation in all non-WSA lands within the ACECs.

Portions of the Mount Ellen—Blue Hills (6,214 acres), Muddy Creek/Crack Canyon (17,719 acres), Red Desert (834 acres), and Wild Horse Mesa (10,597 acres) non-WSA lands with wilderness characteristics lie within the 88,900 acre potential Badlands ACEC. These non-WSA lands with wilderness characteristics would be unavailable for grazing in the areas of North and South Caineville Mesas. Also, Class A scenery would be managed as VRM Class II. The mesa tops would be closed to OHV use, and the remainder of the ACEC would be limited to designated routes. The areas would be closed to leasing for oil and gas, and the Class A scenery outside the Mount Ellen—Blue Hills WSA would be recommended for withdrawal from mineral entry. These ACEC management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. The occasional presence and noise of motorized use from vehicles traveling designated routes would reduce opportunities for solitude and conflict with primitive forms of recreation.

A small portion (321 acres) of the Mount Ellen—Blue Hills non-WSA lands with wilderness characteristics lies within the 4,800 acre potential Bull Creek ACEC. Within the non-WSA lands with wilderness characteristics that overlap the ACEC, motorized use would be limited to designated routes. This prescription would limit motorized uses. However, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur only if routes were designated near the non-WSA lands and when vehicles were traveling the designated routes. The management prescriptions would allow fencing for the protection of important cultural sites. These improvements would affect the natural character if placed within the non-WSA lands with wilderness characteristics areas.

Portions of the Dirty Devil/French Spring (58,051 acres), Fiddler Butte (12,027 acres), Flat Tops (8 acres), and Little Rockies (3,190 acres) non-WSA lands with wilderness characteristics lie within the 205,300 acre potential Dirty Devil ACEC. These non-WSA lands with wilderness characteristics would

be designated as VRM Class II in any areas containing Class A scenery, would be unavailable for livestock grazing in Beaver Wash, and would be closed to OHV use or limited to designated trails (to protect scenic values). VRM Class I or II areas would be designated ROW avoidance areas, inholdings would be acquired from willing sellers, Class A scenery would be recommended for withdrawal from mineral entry, and VRM Class II areas would be open for leasing subject to major constraints (NSO) for oil and gas. These ACEC management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. The management prescriptions would allow fencing of riparian areas to exclude livestock, fencing for the protection of important cultural sites, water developments to benefit desert bighorn sheep, and camping facilities. These improvements could affect the natural character if placed within the non-WSA lands with wilderness characteristics areas. In areas in which OHV use would be limited to designated routes, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur when routes were designated near or within non-WSA lands and when vehicles were traveling the designated routes.

The Fremont Gorge non-WSA lands with wilderness characteristics (15,941 acres) lie within the 34,300 acre potential Fremont Gorge/Cockscomb ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class II in any areas containing Class A scenery, OHV use would be limited to designated routes (to protect scenic values), Class A scenery would be recommended for withdrawal from mineral entry, and VRM Class II areas would be open leasing subject to major constraints (NSO) for oil and gas. These ACEC management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. The management prescriptions would allow fencing for the protection of important cultural sites, possibly affecting the natural character if placed within the non-WSA lands with wilderness characteristics areas. In areas in which motorized use would be limited to designated routes, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur when vehicles were traveling the designated routes.

All of the Mount Hillers non-WSA lands with wilderness characteristics (1,757 acres) and portions of the Bull Mountain (2,821 acres), Mount Ellen—Blue Hills (17,771 acres), Mount Pennell (45,731 acres), and Ragged Mountain (24,408 acres) non-WSA lands with wilderness characteristics lie within the 288,200 acre potential Henry Mountains ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class II in any areas containing Class A scenery and would be closed to OHV use or limited to designated routes. No Man's Mesa would be closed to OHV use, VRM Class I or II areas would be designated ROW avoidance areas, and inholdings would be acquired from willing sellers. The ACEC prescriptions also recommend withdrawing No Man's Mesa and Class A scenery from mineral entry and designating VRM Class II areas and No Man's Mesa as closed to leasing for oil and gas. These management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. The management prescriptions would allow for maintenance of erosion control structures, fencing (to protect important cultural sites), and manipulation of habitat and range improvements (to benefit wildlife), all of which could affect the natural character if placed within the non-WSA lands with wilderness characteristics areas. In areas in which motorized use would be limited to designated routes, the occasional presence and noise of motorized use would reduce opportunities for solitude and conflict with primitive forms of recreation. This conflict would occur when routes were designated near or within non-WSA lands and when vehicles were traveling the designated routes.

Portions of the Horseshoe Canyon South (2,934 acres) and Labyrinth Canyon (1 acre) non-WSA lands with wilderness characteristics lie within the 40,900 acre (RFO portion only) potential Horseshoe Canyon

ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class II in any areas containing Class A scenery and closed to OHV use or limited to designated routes. No new ROWs would be authorized in VRM Class I and II areas, inholdings would be acquired from willing sellers, Class A scenery would be recommended for withdrawal from mineral entry, and VRM Class II areas would be managed as open to leasing subject to major constraints (NSO) for oil and gas. These ACEC management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. The management prescriptions would allow fencing to protect important cultural sites and fencing of riparian areas to exclude livestock. Fencing could affect the natural character if fences were placed within the non-WSA lands with wilderness characteristics areas. In areas in which motorized use would be limited to designated trails, the occasional presence and noise of motorized use would reduce opportunities for solitude and conflict with primitive forms of recreation. This conflict would occur when routes were designated near or within non-WSA lands and when vehicles were traveling the designated routes.

All of the Phonolite Hill (7,908 acres) non-WSA lands with wilderness characteristics and portions of the Kingston Ridge (2,126 acres) and Rocky Ford (6,429 acres) non-WSA lands with wilderness characteristics lie within the 22,100 acre potential Kingston Canyon ACEC. Within the non-WSA lands with wilderness characteristics areas, inholdings in the riparian corridor would be acquired from willing sellers, and motorized use would be limited to designated routes and limited seasonally to protect wildlife habitat. This prescription would limit motorized uses. However, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur only if routes were designated near the non-WSA lands and when vehicles were traveling the designated routes.

A portion (8,692 acres) of the Little Rockies non-WSA lands with wilderness characteristics lies within the 49,200 acre potential Little Rockies ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class II in any areas containing Class A scenery. OHV use would be limited to designated routes, no new ROWs would be authorized in areas containing Class A scenery, inholdings would be acquired from willing sellers, areas containing Class A scenery would be recommended for withdrawal from mineral entry, and VRM Class II areas would be managed as closed to leasing subject to major constraints (NSO) for oil and gas. These ACEC management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation. The management prescriptions would allow range improvements, primarily water developments, to benefit wildlife. If placed within the non-WSA lands with wilderness characteristics areas, these improvements could affect the natural character. The management prescriptions would limit motorized uses. However, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur only if routes were designated near the non-WSA lands and when vehicles were traveling the designated routes.

A portion (15,778 acres) of the Wild Horse Mesa non-WSA lands with wilderness characteristics area lies within the 16,200 acre (RFO portion only) potential Lower Muddy Creek ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class II in any areas containing Class A scenery and closed to OHV use or limited to designated routes. ROWs would be authorized consistent with VRM Class II objectives, inholdings would be acquired from willing sellers, and the areas would be closed to leasing for oil and gas. These ACEC management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. The management prescriptions would limit motorized uses. However, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of

recreation. This conflict would occur only if routes were designated near the non-WSA lands and when vehicles were traveling the designated routes.

A portion (27 acres) of the Wildcat Knolls non-WSA lands with wilderness characteristics lies within the 180 acre potential Quitchupah ACEC. Within the non-WSA lands with wilderness characteristics that overlap the ACEC, motorized use would be limited to designated routes. This prescription would limit motorized uses. However, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur only if routes were designated near the non-WSA lands and when vehicles were traveling the designated routes. The management prescriptions would allow fencing to protect important cultural sites. If placed within the non-WSA lands with wilderness characteristics areas, these improvements could affect the natural character of those lands.

Portions of the Jones Bench (43 acres) and Limestone Cliffs (385 acres) non-WSA lands with wilderness characteristics areas lie within the 500 acre potential Thousand Lakes Bench ACEC. These non-WSA lands with wilderness characteristics would be designated as closed to OHV use or would limit OHV use to designated routes. These prescriptions would limit motorized uses. However, the occasional presence and noise of motorized use would reduce opportunities for solitude and would conflict with primitive forms of recreation. This conflict would occur only when vehicles were traveling the designated routes. The management prescriptions would allow fencing to protect important cultural sites. If placed within the non-WSA lands with wilderness characteristics areas, these improvements could affect the natural character of those lands.

Alternative D

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative C.

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under the Proposed RMP.

Impacts from Paleontological Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Under Alternative D, 682,600 acres in all of the 29 non-WSA lands with wilderness characteristics would be designated as VRM Class I, protecting the natural character of those lands and the settings required to support opportunities for solitude and primitive forms of recreation.

Impacts from Special Status Species

Impacts would be similar to those described under Alternative A. However, under Alternative D, surface-disturbing activities would not be permitted on non-WSA lands with wilderness characteristics, thereby protecting those values.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative C. However, under Alternative D, habitat manipulations would be limited to fire or biological methods that would not impact the naturalness of the

non-WSA areas or affect the opportunities for solitude and primitive recreation in these areas. In addition, construction of new range projects that benefit wildlife would not be considered unless they meet VRM Class I objectives and meet the goals and objectives of protecting wilderness characteristics values. This management would continue to protect the natural values of the non-WSA lands with wilderness characteristics.

Under Alternative D, all lands within the Mount Ellen—Blue Hills, Bull Mountain, Ragged Mountain, Mount Hillers, and Mount Pennell areas would be closed to OHV use, to protect crucial bison habitat. This closure would help to maintain the opportunities for solitude and primitive recreation within these non-WSA lands with wilderness characteristics.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, all non-WSA lands with wilderness characteristics would be managed by the following prescriptions:

- Designate VRM Class I
- Manage for primitive and semi-primitive non-motorized recreation
- Close to OHV use
- Make unavailable for disposal
- Designate ROW exclusion areas
- Recommend for withdrawal from mineral entry
- Close to leasing for oil and gas
- Close to disposal of salable minerals (mineral materials)
- Make unavailable for further consideration for coal leasing

These prescriptions would prevent surface disturbances that would degrade the natural character of the non-WSA areas, prevent surface disturbances and uses that would be incompatible with primitive recreation activities, and protect the setting needed to support the experience of solitude.

Impacts from Forestry and Woodland Products

Under Alternative D, all 682,600 acres of non-WSA lands with wilderness characteristics in the 29 areas within the RFO would be restricted from commercial and non-commercial timber harvest, commercial and non-commercial use of forest and woodland products, and commercial live plant and seed collection. All wilderness characteristics values would therefore be protected from this activity and would maintain the natural character and opportunities for solitude and primitive recreation.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

ERMAs

Impacts would be similar to those described under Alternative A. However, no large group areas would be designated for campsites and group events in the Mount Pennell non-WSA area, thereby protecting the naturalness and opportunities for solitude and primitive recreation in this area.

SRMAs

Seven of the proposed SRMAs would overlap portions of 24 non-WSA lands with wilderness characteristics areas. There would be 634,070 acres (or 93%) of non-WSA lands within the seven SRMAs. The Capitol Reef, Dirty Devil/French Spring, East Fork Sevier River, Henry Mountains, Labyrinth Canyon, Little Rockies, and San Rafael Swell SRMAs would overlap all of the Bullfrog Creek, Dogwater Creek, Long Canyon, Mount Ellen—Blue Hills, Mount Pennell, Notom Bench, Red Desert, Dirty Devil/French Spring, Fiddler Butte, Flat Tops, Sweetwater Reef, Jones Bench, Kingston Ridge, Phonolite Hill, Rocky Ford, Bull Mountain, Mount Hillers, Ragged Mountain, Horseshoe Canyon South, Labyrinth Canyon, Little Rockies, Muddy Creek/Crack Canyon, and Wild Horse Mesa non-WSA lands with wilderness characteristics areas and about half of the Fremont Gorge non-WSA area.

Under each SRMA, management objectives would be to protect and preserve the wilderness characteristics values of the non-WSA lands. This management would include closing lands to OHV use and providing for primitive recreational experiences. All wilderness characteristics values would therefore be maintained under Alternative D.

Travel Management

Alternative D would designate all 682,600 acres (100%) of the 29 non-WSA lands with wilderness characteristic areas as closed to OHV use. Because these areas would be closed, no routes would be designated; surface disturbance caused by motorized travel, and the resultant impacts to the natural character of the non-WSA areas, would not occur. Further, the opportunities for conflict between primitive forms of recreation and motorized uses in these areas would not occur. The natural character and opportunities for solitude and primitive recreation of these non-WSA areas would be unaffected by OHV travel.

By closing all non-WSA lands with wilderness characteristics to OHV travel, Alternative D would provide the most protection for the naturalness and opportunities for solitude and primitive recreation of these lands.

Impacts from Lands and Realty

Land Tenure Adjustments

Under Alternative D, no non-WSA lands would be considered for sale or other land tenure adjustments because to do so would not be in conformance with the Proposed RMP decisions to protect non-WSA lands with wilderness characteristics. This management would continue to protect and preserve the wilderness characteristics values of these areas.

Withdrawals

Under Alternative D, all 682,600 acres within non-WSA lands with wilderness characteristics would be recommended for withdrawal from mineral entry. This withdrawal would preclude surface-disturbing activities that would be associated with mining and that would impact wilderness characteristics. The withdrawal would continue to preserve the naturalness and opportunities for both solitude and primitive forms of recreation in each of the non-WSA areas, by preventing mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining.

Should exploration or development be proposed on the existing mining claims in the 13 non-WSA lands with wilderness characteristics, then those values would be impacted as described under Alternative N.

Rights-of-Way and Other Land Use Authorizations

Under Alternative D, no ROW corridors that would impact non-WSA lands with wilderness characteristics would be designated, and all non-WSA lands would be managed as ROW exclusion areas (Table 4-27). Exclusion from future ROWs would protect the natural character in all these lands. Protection of the natural landscape would also preserve the setting needed to support primitive forms of recreation and experiences of solitude. The same protections would prevent corridor designations within any of the non-WSA lands with wilderness characteristics, thus protecting those values.

Under Alternative D, only land use authorizations that meet this alternative's Proposed RMP objective to protect non-WSA lands with wilderness characteristics would be authorized. Thus, the natural character of these lands would be protected, and the setting needed to support primitive forms of recreation and experiences of solitude would be preserved.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to leasing for oil and gas within non-WSA lands with wilderness characteristics are illustrated in Table 4-28. Exploration and development activities could impact wilderness characteristics through the direct disturbance of the natural terrain and consequent impacts on opportunities for solitude and primitive recreation.

Under Alternative D, all non-WSA lands with wilderness characteristics would be closed to leasing. However, existing leases would still remain in 4 of the 29 non-WSA lands with wilderness characteristics areas. All these leases would be within RFD Areas 1 and 2. Development of these leases could compromise wilderness characteristics values in these areas. The following is a breakdown of how or where that might occur, based on the RFD area and the predicted surface disturbance for oil and gas activity for Alternative D. Those non-WSA lands with wilderness characteristics that are not currently leased (including all of 20 areas in RFD Areas 1 and 2 and all of the areas in RFD Area 3) would be fully protected under the leasing closure of this alternative. This protection would preserve the naturalness of the areas and would maintain the outstanding opportunities for primitive recreation and solitude. When the leases within the four non-WSA areas expire, then those lands would be closed to any new leasing.

In RFD Areas 1 and 2, four non-WSA wilderness characteristics areas have portions under existing leases; these portions comprise 51,510 acres. There are 645,800 acres of non-WSA lands with wilderness characteristics within this combined RFD area. The Flat Tops and Dirty Devil/French Spring non-WSA lands have the greatest percentage of area leased at this time. Given that under Alternative D, the projection for drilling for oil and gas is 45 wells (or about 3 wells per year) for the entire RFD area and that 8% of the lands the RFD area encompasses are in non-WSA lands with wilderness characteristics that are leased (or 2% of the RFD area), 1 well could be drilled within the currently leased non-WSA areas. This action could disturb as much as 12 acres during the life of the plan. The leases, if not developed or held in production, would expire after 10 years. Development of any leases within the non-WSA areas could cause that portion to lose their natural character and opportunities for solitude and primitive recreation because of exploration for and development of oil and gas resources. Because of the small amount of acreage projected to be disturbed and the one well projected for the non-WSA leased lands in this RFD, it is anticipated that only a small portion of any of the non-WSA lands with wilderness characteristics could lose its wilderness characteristics. Far less than one percent of any of the non-WSA areas would be at risk of loss of wilderness characteristics.

In RFD Area 3, all 36,800 acres of non-WSA lands with wilderness characteristics would be closed to leasing. No oil and gas related surface-disturbing activities would be allowed, and wilderness values would be protected.

All non-WSA lands with wilderness characteristics would be closed to geophysical exploration, thereby protecting the wilderness characteristics of these areas.

Leasable Minerals—Geothermal

All non-WSA lands with wilderness characteristics would be closed to geothermal leasing, thereby protecting the wilderness characteristics from surface-disturbing activities.

Leasable Minerals—Coal

Under Alternative D, coal leasing or exploratory activities would not be considered within any non-WSA lands with wilderness characteristics. This management would protect those non-WSA lands with coal resources suitable for leasing (Mount Pennell, Mount Ellen—Blue Hills, Limestone Cliffs, and Rock Canyon) from surface-disturbing activities related to coal resources. Naturalness and opportunities for solitude and primitive recreation would be maintained.

Non-Energy Solid Leasable Minerals

Leasing would not be authorized for non-energy solid leasable minerals, thereby protecting the wilderness characteristics values.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Salable Minerals

Under Alternative D, all lands within the non-WSA lands with wilderness characteristics would be closed to salable mineral disposal. These areas would be fully protected under the leasing closure under this alternative. This management would preserve the naturalness of the areas and would maintain the outstanding opportunities for primitive recreation and solitude.

Impacts from Special Designations

Wild and Scenic Rivers

Under Alternative D, 4 of the 29 non-WSA land areas intersect with suitable WSR segments, totaling 33.35 miles in those 4 areas. There are 19.31 miles of Dirty Devil River, 0.12 miles of No Man's Canyon, 2.83 miles of Robbers Roost Canyon, 0.13 miles of Sam's Mesa Box Canyon, 1.39 miles of Twin Corral Box Canyon, 5 miles of Fremont River (Fremont Gorge), 3.26 miles of Fremont River (Capitol Reef National Park to Caineville Ditch Diversion), and 1.4 miles of Maidenwater Creek that would be managed to preserve their WSR suitability. Protection of river values would prevent uses and surface disturbances that would detract from the natural character of the Dirty Devil/French Spring, Fremont Gorge, Red Desert, and Little Rockies non-WSA lands with wilderness characteristics within the half-mile river corridor (one-quarter mile of the high water mark on each bank of the river segment).

Alternative D would provide the most long-term protection of the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics because it recommends the most miles of waterways for protection in the NWSRS. However, Alternative D would also allow for specific management to protect non-WSA lands with wilderness characteristics, in addition to management of the suitable WSRs.

Areas of Critical Environmental Concern

Under Alternative D, 16 ACECs would be designated to protect a variety of relevant and important values; 11 of these ACECs would overlay non-WSA lands with wilderness characteristics. Those ACECs

are Badlands, Bull Creek, Dirty Devil, Fremont Gorge/Cockscomb, Henry Mountains, Horseshoe Canyon, Kingston Canyon, Little Rockies, Lower Muddy Creek, Quitchupah, and Thousand Lakes Bench. The management prescriptions for these ACECs would protect naturalness and opportunities for solitude and primitive recreation in all the non-WSA lands within the ACECs.

Portions of the Mount Ellen—Blue Hills (6,214 acres), Muddy Creek/Crack Canyon (17,719 acres), Red Desert (834 acres), and Wild Horse Mesa (10,597 acres) non-WSA lands with wilderness characteristics lie within the 88,900 acre potential Badlands ACEC. These non-WSA lands with wilderness characteristics would be unavailable for grazing in the areas of North Caineville Mesa and South Caineville Mesa, would allow no fencing or other surface-disturbing activities, would be designated as VRM Class I, and would be closed to leasing for oil and gas. Furthermore, the mesa tops and wilderness characteristics lands would be closed to OHV use and the remainder of the ACEC would be limited to designated routes; and the wilderness characteristic lands and Class A scenery outside the Mount Ellen—Blue Hills WSA would be recommended for withdrawal from mineral entry. These management prescriptions would reduce surface disturbances and limit motorized uses, thereby protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

A small portion (321 acres) of the Mount Ellen—Blue Hills non-WSA lands with wilderness characteristics lies within the 4,800 acre potential Bull Creek ACEC. The non-WSA lands with wilderness characteristics would be closed to OHV use, and no fencing or other surface-disturbing activities would be allowed. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

Portions of the Dirty Devil/French Spring (58,051 acres), Fiddler Butte (12,027 acres), Flat Tops (8 acres), and Little Rockies (3,190 acres) non-WSA lands with wilderness characteristics lie within the 205,300 acre potential Dirty Devil ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class I, would be unavailable for livestock grazing in Beaver Wash, would be closed to OHV use, would designate VRM Class I or II areas as ROW avoidance areas, would be recommended for withdrawal from mineral entry, and would be closed to leasing from oil and gas. Inholdings in these non-WSA lands would be acquired from willing sellers, No fencing of riparian areas or cultural sites and no water developments or camping facilities would be allowed within the wilderness characteristics lands. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

The Fremont Gorge (15,941 acres) non-WSA lands with wilderness characteristics area lies within the 34,300 acre potential Fremont Gorge/Cockscomb ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class I, closed to OHV use, recommended for withdrawal from mineral entry, and closed to leasing from oil and gas. No fencing or other surface-disturbing activities would be allowed. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

All of the Mount Hillers (1,757 acres) non-WSA lands with wilderness characteristics area and portions of the Bull Mountain (2,821 acres), Mount Ellen—Blue Hills (17,771 acres), Mount Pennell (45,731 acres), and Ragged Mountain (24,408 acres) non-WSA lands with wilderness characteristics areas lie within the 288,200 acre potential Henry Mountains ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class I and closed to OHV use. VRM Class I or II areas would be designated as ROW avoidance areas, and inholdings would be acquired from willing sellers.

The ACEC prescriptions also recommend withdrawing non-WSA lands with wilderness characteristics, No Man's Mesa, and areas with Class A scenery from mineral entry and designating wilderness characteristic lands, VRM Class II areas, and No Man's Mesa as closed to leasing for oil and gas. No maintenance of erosion-control structures, fencing of cultural sites, manipulation of habitat, or range improvements would be allowed within the wilderness characteristic lands. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

A portion (2,934 acres) of the Horseshoe Canyon South non-WSA lands with wilderness characteristics area lies within the 40,900 acre (RFO portion only) potential Horseshoe Canyon ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class I, closed to OHV use, recommended for withdrawal from mineral entry, and closed to leasing from oil and gas. New ROWs in VRM Class I and II areas would not be authorized, and inholdings would be acquired from willing sellers, No fencing of cultural sites or riparian areas would be allowed within the wilderness characteristics lands. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character and opportunities for solitude and primitive recreation of the non-WSA lands with wilderness characteristics.

All of the Phonolite Hill non-WSA lands with wilderness characteristics area (7,908 acres) and portions of the Kingston Ridge (2,126 acres) and Rocky Ford (6,429 acres) non-WSA lands with wilderness characteristics lie within the 22,100 acre potential Kingston Canyon ACEC. Within the non-WSA lands with wilderness characteristics areas, inholdings within the riparian corridor would be acquired from willing sellers, and the wilderness characteristics lands would be closed to OHV use. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

A portion (8,692 acres) of the Little Rockies non-WSA lands with wilderness characteristics area lies within the 49,200 acre potential Little Rockies ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class I, closed to OHV use, recommended for withdrawal from mineral entry, and closed to leasing from oil and gas. New ROWs in areas containing Class A scenery or in wilderness characteristics lands would not be authorized, inholdings would be acquired from willing sellers, and no surface-disturbing activities would be allowed. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character and the opportunities for solitude and primitive recreation of the non-WSA lands with wilderness characteristics.

A portion (15,778 acres) of the Wild Horse Mesa non-WSA lands with wilderness characteristics lies within the 16,200 acre (RFO portion only) potential Lower Muddy Creek ACEC. These non-WSA lands with wilderness characteristics would be designated as VRM Class I, closed to OHV use, and closed to leasing from oil and gas. New ROWs would be avoided, and inholdings would be acquired from willing sellers, These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

A portion (27 acres) of the Wildcat Knolls non-WSA lands with wilderness characteristics lies within the 180 acre potential Quitchupah ACEC. These non-WSA lands with wilderness characteristics would be closed to OHV use, and no fencing or other surface-disturbing activities would be allowed for the protection of cultural sites. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation. A portion of the Jones Bench

(43 acres) and Limestone Cliffs (385 acres) non-WSA lands with wilderness characteristics lie within the 500 acre potential Thousand Lakes Bench ACEC. These non-WSA lands with wilderness characteristics would be designated as closed to OHV use, and no fencing or other surface-disturbing activities would be allowed for the protection of cultural sites. These management prescriptions would reduce surface disturbances and limit motorized uses, thus protecting the natural character of the non-WSA lands with wilderness characteristics and the opportunities for solitude and primitive recreation.

Because it designates the most acres as ACECs, Alternative D would provide the most long-term protection to the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics. However, Alternative D would also allow for specific management to protect non-WSA lands with wilderness characteristics, in addition to management of the ACECs.

4.4 IMPACTS TO RESOURCE USES

4.4.1 Forestry and Woodland Products

This analysis addresses potential impacts on forest and woodland products harvest, caused by implementing the management actions under the alternatives described in Chapter 2. This analysis focuses on those management actions that place limitations or affect the quantity or quality of products within the RFO. Impacts on forest and woodland health are discussed in the Impacts to Vegetation section of this chapter. In the absence of quantitative data, best professional judgment was used, and impacts are sometimes described by using ranges of potential impacts or in qualitative terms, if appropriate.

Methods and Assumptions

The analysis is based on the following assumptions:

- Several traditional woodland products (e.g., Christmas trees, posts, poles) may be harvested from tree species growing on sites not classified as forest or woodland.
- Demand for forest and woodland products is not anticipated to grow substantially during the planning period.
- Supply of forestry and woodland products would continue to substantially exceed demand.

Environmental Consequences

Impacts to forestry and woodlands would likely result from actions proposed under the following resource programs:

- Air Quality
- Soil Resources and Water Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products
- Recreation
- Travel Management
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on forestry and woodland products. There are no WSA decisions that would impact forestry and woodland products.

Alternative N: No Action

Impacts from Air Quality

Proposed decisions for air would have minimal effect on harvesting of forest and woodland products. Burning of slash piles could be necessary, following some harvesting projects. Air quality requirements would need to be considered and smoke management would be implemented to meet air quality standards.

Impacts from Soil Resources and Water Resources

Current demand for forest and woodland products is low, and demand is expected to remain stable because of the remoteness of resources. In general, decisions proposed for managing soil and water resources would also improve forest and woodland health by providing for overall ecosystem health through the continued implementation of the *Fundamentals of Rangeland Health.* Based on current levels of forest and woodland harvest and limited areas available for harvest, road and trail construction (which would result in new soil disturbance) is not expected. Therefore, the impacts that soils and water decisions would cause to forest and woodland products harvesting under Alternative N would be minimal.

Impacts from Visual Resources

Under Alternative N, 529,500 acres would be managed to meet VRM Class II objectives, of which 446,900 acres are within WSAs in which forest and woodland harvest is prohibited. Managing the 82,600 acres outside of the WSAs to meet VRM Class II objectives could alter the size, type, and location of forest and woodland product harvest or forest health projects. However, not all of these 82,600 acres have forest and woodland resources. The remainder of the RFO (1,598,500 or 75%) would be managed as VRM Classes III and IV, which would allow for moderate (Class III) or major (Class IV) changes to the landscape. This management would allow flexibility for forest and woodland products harvest and management of forests and woodlands in most of the RFO lands to meet the objectives of the Healthy Forest Restoration Act (HFRA) of 2003.

Impacts from Special Status Species

Proposed management for SSS habitats could limit forest and woodland product harvest, but acreage amounts would be minimal. The majority of SSS present in the lands managed by the RFO either do not inhabit forest and woodland areas, are protected by topography, or inhabit WSAs in which harvest would not be allowed. Any forest management activities would necessarily be designed to avoid, mitigate, or improve the habitat for SSS.

Impacts from Fish and Wildlife

Proposed decisions for fish and wildlife could restrict some harvest by location or season. Seasonal or spatial restrictions for bison, mule deer, and elk could impact the success of commercial product harvest and forest health projects. Prohibiting surface-disturbing activities from November 1 through May 15 (6 and one-half months each year) could make it difficult to complete some projects. Seasonal or spatial restrictions for other wildlife species would not affect the harvesting of forest and woodland products because few resources are located in these habitat areas. Habitat treatment projects could indirectly improve forest and woodland health and increase the availability of some woodland products, depending on the treatment method used. Overuse of wildland or prescribed fire as a treatment method could result in a reduction of woodland products for the public because of the uncontrollable nature of fire and the possible elimination of prime woodland product areas that could otherwise be protected. In some cases, forest management could be used as a tool for improving wildlife habitat, resulting in a benefit for both resources.

Impacts from Fire and Fuels Management

Suppressing all wildland fires could increase seedling/sapling survival, thus increasing stand density. The existing trend of pinyon-juniper woodland encroachment would continue under full fire suppression and fewer hazardous fuels treatment acres. Overall, this trend could lead to increasing fuel loading and the potential for uncharacteristically large or intense wildfires that would reduce the availability of forest and woodland products.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N.

Impacts from Forestry and Woodland Products

Management actions implemented to support the objectives of HFRA would increase the long-term health and productivity of forest and woodlands and indirectly increase resistance to insect pest infestations. Current management of timber and woodland products has not effectively improved forest and woodland health and has restricted areas available to harvest. The current trends would continue, possibly leading to hazardous fuels, insect infestations, and continued encroachment of pinyon-juniper. This trend is primarily because of low program activity, resulting from low demand for products, remoteness of the resource, and limited resources to complete needed actions.

Impacts from Recreation

The current recreation management would not affect the harvest of forest and woodland products. Developed recreation sites are not located in woodland harvest areas, and the majority of current recreation activity is of a dispersed nature, with little recreation occurring in woodland zones.

Impacts from Travel Management

Proposed decisions for OHV area and route designations could impact casual collection of forest and woodland products, by limiting off-road access. However, restrictions under Alternative N are the least of any alternative: 1,636,400 acres (77%) of the RFO would be open to motorized vehicles; motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO; and 214,000 acres (10%) of the RFO would be closed to motorized vehicle use. The public would have access to 4,315 miles of unpaved routes in the RFO. Access for commercial activities, non-commercial permitted activities (firewood and Christmas tree cutting), and forest health projects is an administrative use that would be addressed in the permitting process.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Although some acres of the lands managed by the RFO and having forest and woodland resources would be open for leasing, the potential for impact is minimal because despite historical oil and gas exploration, no production in forested areas of the RFO has occurred. The same trend is expected to continue. If some production in woodland areas did take place, little impact would be expected because of the limited amount of disturbance that would occur. New roads built to wells could improve access to woodland areas for those harvesting woodland products.

Leasable Minerals—Coal

Development of a surface coal mine is unlikely during the life of the plan and therefore is not anticipated to affect forest and woodland products. Development of a subsurface coal mine is also unlikely during the life of the plan, and if developed would affect a much smaller surface area than a surface mine would.

Locatable Minerals

Little mining of locatable minerals is expected within the RFO during the next 15 to 20 years. Although it cannot be determined whether any potential mining would preclude harvest of forest and woodland products, the potential for impacts to forest and woodland products would be small. Most locatable minerals have historically been found in locations not conducive to woodland product harvest (e.g., high in the Henry Mountains).

Impacts from Special Designations

Wild and Scenic Rivers

Eligibility of WSRs would not impact harvesting of forest and woodland products because these resources are either not present or are very limited within the eligible WSR corridors.

Areas of Critical Environmental Concern

Management actions for protection of relevant and important values of ACECs may affect the availability of forest and woodland products harvest. Management prescriptions associated with ACEC designation that would affect visual resources include managing oil and gas leasing as closed to leasing or open to leasing subject to major constraints (NSO), more restrictive VRM designations, restricting livestock grazing, and travel limitations. Alternative N continues the designation of four ACECs (14,780 acres). Scenery was not one of the relevant and important values identified for these ACECs. However, allowing no uses that would cause irreparable damage to the relevant and important values in these areas would reduce surface-disturbing activities within those areas and protect visual resources. Such actions could include closing the areas to OHV use; managing the areas as closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; making the area unavailable for livestock grazing in three of the four ACECs; and acquiring inholdings.

Along with continuing the designations of Beaver Wash, North Caineville Mesa, and South Caineville Mesa ACECs, proposals under Alternative N would allow no uses that would cause irreparable damage to relevant and important values in those areas, would close the areas to OHV use, and would propose the areas for withdrawal from mineral entry. In addition to the above, Gilbert Badlands would be recommended to have no surface-disturbing activities allowed. However, because these areas are small in extent and do not have economically important forestry and woodland resources, there would be no effect on these resources.

Alternative A

Impacts from Air Quality

Impacts would be the same as those described under Alternative N.

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Under Alternative A, all acreage outside WSAs would be designated as VRM Classes III and IV (1,681,100 acres, or 79% of the RFO), allowing for moderate (Class III) or major (Class IV) changes to the landscape. This designation would allow slightly more flexibility than under Alternative N for forest and woodland products harvest and for management of forests and woodlands to meet the HFRA objectives. This increased flexibility would result from the increased land area available to implement management actions that would create visual changes on the landscape (e.g., cuttings, thinnings, and harrow treatments).

Impacts from Special Status Species

Impacts would be similar to those described under Alternative N, except that fewer areas would be restricted under Alternative A. For example, activities within Greater sage-grouse brooding/nesting habitat would be restricted from April 1 through June 15 under Alternative N, but no restrictions apply under Alternative A. Thus there would be increased opportunities for harvesting of forest and woodland products under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Using non-fire treatment methods to reduce hazardous fuels would increase the amount of biomass available. The use of prescribed fire and non-fire treatments would increase the opportunities for fuelwood and biomass harvest. Hazardous fuel reductions could alter the structure of forest and woodland areas by removing fire susceptible individuals and reducing stand density. Overall, these management actions could increase the economic value of forest products and reduce the risk of uncharacteristically large or intense wildfires in some areas. Alternative A would increase the availability of forest and woodland products, compared to Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative A, resulting in no impacts to forestry and woodlands.

Impacts from Forestry and Woodland Products

Management actions implemented to support the objectives of the HFRA would increase the long-term health and productivity of forest and woodlands and indirectly increase resistance to insect pest infestations. Forestry management actions under Alternative A would provide for commercial and non-commercial timber and woodland product harvest when feasible, sustainable, and compatible with restoring, maintaining, and improving forest health. Availability of timber and woodland products would be increased, compared with Alternative N or C, and would allow for more flexibility towards meeting the objectives of the HFRA.

Impacts from Recreation

Proposed decisions regarding recreation management would not affect the harvest of forest and woodland products because proposed facilities that could preclude harvest would be expected to be minimal and to occur only when necessary to protect resources. SRMAs are proposed but do not include prescriptions to close the areas to harvest. If deemed in conflict with SRMA management, harvest restrictions would be addressed during completion of the individual SRMA activity plans.

Impacts from Travel Management

The type of impacts would be similar to those described under Alternative N, except that under Alternative A, less area (449,000 acres—21% of the RFO) would be open to motorized vehicles; motor vehicles would be limited to designated routes on 1,679,000 acres (79% of the RFO); and no areas would be closed to motorized vehicle use. The public would have access to 4,312 miles of unpaved routes in the RFO. Access would be restricted more under Alternative A than under Alternative N but would be less restricted than under Alternative C or D or the Proposed RMP.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

No river segments would be recommended as suitable WSRs under Alternative A.

Areas of Critical Environmental Concern

No ACECs would be proposed for designation under Alternative A.

Proposed RMP

Impacts from Air Quality

Impacts would be the same as those described under Alternative N.

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Under the Proposed RMP, 249,800 (12%) of the RFO would be designated as VRM Class II, meaning that only low levels of changes to the landscape could occur. Although designating these areas as VRM Class II could alter the size, type, and location of forest and woodland product harvest or forest health projects to meet the associated management objectives, forest and woodland products are not present on all of these acres. Sixty-seven percent of the RFO (1,431,300 acres) would be designated as VRM Classes III and IV, which allow for moderate (Class III) or major (Class IV) changes to the landscape and thus would allow more opportunities for forest and woodland product harvest. Slightly fewer acres would be designated as VRM Classes III and IV under the Proposed RMP than under Alternative N or A.

Impacts from Special Status Species

Impacts would be similar to those described under Alternative N, except that there are different restrictions between the two alternatives in regards to Greater sage-grouse. Under Alternative N surface disturbing activities within sage-grouse breeding and brooding-rearing habitats would be restricted from March 1 through July 15; under the Proposed RMP, these activities would be restricted within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14. These restrictions could result in decreased opportunities for harvesting of forest and woodland products under the Proposed RMP, compared to Alternatives N and A. However because forested areas within sage-grouse habitat are generally limited, these restrictions are expected to have minimal impact on harvest of forest and woodland products. Also because 97 percent of sage-grouse winter habitat is within mule deer crucial habitat, which has a timing limitation on surface disturbing activities from December 15 through April 15, the sage-grouse winter timing limitation would only result in surface disturbing restrictions on an additional 2,200 acres.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative A.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, protecting the wilderness characteristics on 78,600 acres (4% of the RFO) would generally preclude the harvesting of forest and woodland products when they are present within these areas. Non-WSA lands with wilderness characteristics would be closed to woodland products harvesting, OHV and mechanized use would be limited to designated routes, and the areas would be designated as VRM Class II. These management actions would have beneficial and adverse impacts on woodland resources. Closing non-WSA areas with wilderness characteristics to woodland products harvesting and limiting OHV access would preserve the resource by beneficially reducing direct and indirect impacts caused by surface disturbances within these areas (e.g., soil compaction and erosion,

increased fire risks because of OHVs, increased potential of invasive species invasion, replacement of woodland resources). However, long-term, adverse impacts would be produced by the reduced opportunities for woodland harvesting for products use and by the restrictions on vegetation removal and treatments that could otherwise reduce understory fire risks and improve woodland ecological conditions.

Impacts from Forestry and Woodland Products

Impacts would be the same as those described under Alternative A.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

The types of impacts would be similar to those described under Alternative N. However, under the Proposed RMP, substantially less area would be open to motorized vehicles (9,890 acres—less than 1% of the RFO); motor vehicles would be limited to existing, designated, and maintained routes on 1,908,210 acres (90% of the RFO); and 209,900 acres (10% of the RFO) would be closed to motorized vehicle use. The public would have access to 4,277 miles of unpaved routes in the RFO. Access would be more restricted under the Proposed RMP than under Alternative N or A but less restricted than under Alternative C or D.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under the Proposed RMP, two ACECs (2,530 acres) would be designated: North Caineville Mesa and Old Woman Front. Special management prescriptions for the North Caineville Mesa ACEC would include closing the area to OHV use; prescriptions for Old Woman Front would include prohibiting the harvesting of forest and woodland products and closing the area to OHV use. These prescriptions would affect the availability of these resources to the public, but because the total area involved would be so small, the overall effect to the program would be negligible.

Alternative C

Impacts from Air Quality

Impacts would be the same as those described under Alternative A.

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced under Alternative C would be similar to those described under Alternative A, except that the acreage designated as VRM Class II would increase to 230,600 (or 11% of the RFO), which is slightly more than under Alternative A. VRM Classes III and IV would be designated on 1,450,500 acres (68%) of the RFO, which would allow more opportunities for forest and woodland product harvest.

Impacts from Special Status Species

Impacts would be similar to those described under the Proposed RMP, however, there would be fewer restrictions on surface disturbing activities within Greater sage-grouse habitat. Because forested areas within sage-grouse habitat are generally limited, the restrictions that do exist under Alternative C are expected to have minimal impact on harvest of forest and woodland products.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N, except that there are additional restrictions for protection of wildlife habitat areas under Alternative C. For example, OHV use on 142,000 acres of deer and elk crucial winter range and on 189,000 acres of crucial bison habitat would be closed under Alternative C. This management could limit opportunities for harvesting of forest and woodland products compared to Alternative N.

Impacts from Fire and Fuels Management

The management actions to limit fuels treatments and included under Alternative C (such as allowing only fire and biological treatment methods) would allow increased ladder fuels, stand density, and pinyon-juniper encroachment. Indirectly, this management could increase the amount of biomass available from pinyon-juniper woodlands. However, current demands for biomass are low, so this increase could make the forest and woodland areas more vulnerable to mortality from wildfire, insects, and disease. Overall, this increase could lead to increased fuel loading and the potential for uncharacteristically large or intense wildfires, which could reduce the availability of forest and woodland products in the long term.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative C, resulting in no impacts to forestry and woodlands.

Impacts from Forestry and Woodland Products

Management actions implemented to support the objectives of HFRA would increase the long-term health and productivity of forest and woodlands and indirectly increase resistance to insect pest infestations. Under Alternative C, effects to woodland areas would be the same as under Alternative A. However, prohibiting commercial timber harvest could limit the ability to treat timbered acres and might not effectively improve forest and woodland health.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

Under Alternative C, no areas would be open to motorized vehicles. This proposed decision could impact casual collection and non-commercial harvest of forest and woodland products by limiting off-road access. Motor vehicles would be limited to designated routes on 1,445,000 acres (68% of the RFO); and 683,000 acres (32% of the RFO) would be closed to motorized vehicle use. The public would have access to 3,192 miles of unpaved routes. This alternative would result in greater access restrictions and more difficulty harvesting forest and woodland products than under Alternative N or A or the Proposed RMP. However, Alternative C would be less restrictive than Alternative D. Access for commercial activities and forest health projects is an administrative use that would be addressed during permitting or project development.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under Alternative C, 16 ACECs (886,810 acres) would be designated. Special management prescriptions for ACEC could include closing the area(s) to OHV use and prohibiting the harvesting of forest and woodland products (depending on the particular ACEC). These prescriptions would affect the availability of these resources to the public, but because the ACECs tend to be in remote areas away from population centers (where little forestry and woodland products harvesting occurs), the overall effect to the program would be minimal.

Alternative D

Impacts from Air Quality

Impacts would be the same as those described under Alternative N.

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts experienced under Alternative D would be similar to those described under Alternative A, except that all non-WSA lands with wilderness characteristics (682,600 acres—32% of the RFO) would be designated as VRM Class I, precluding harvesting of forest and woodland products to meet the VRM management class objective of preserving the existing character of the landscape. Additionally, acres designated as VRM Classes III and IV would decrease to 931,700 acres. Together, this designation would limit the opportunities for forest and woodland product harvest, although the VRM Class I areas tend to be in remote areas away from population centers (where little forestry and woodland products harvesting occurs).

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative C, except Alternative D provides additional restrictions for protection of wildlife habitat areas. For example, OHV use on 258,000 acres of deer and elk crucial winter range and 207,000 acres of crucial bison habitat would be closed under Alternative D. This management could limit opportunities for harvesting of forest and woodland products more than under any other alternative.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, protecting the wilderness characteristics on 682,600 acres (32% of the RFO) would generally preclude the harvesting of forest and woodland products when they are present within these

areas. Non-WSA lands with wilderness characteristics would be closed to woodland products harvesting, closed to OHVs, and designated as VRM Class I. These management actions would have beneficial and adverse impacts on woodland resources. Closing non-WSA areas with wilderness characteristics to woodland products harvesting and OHV access would preserve the resource by beneficially reducing direct and indirect impacts from surface disturbances within these areas (e.g., soil compaction and erosion, increased fire risks because of OHVs, an increased potential of invasive species invasion and replacement of woodland resources). Long-term, adverse impacts would be produced by the reduced opportunities for woodland harvesting for products use and by the restrictions on vegetation removal and treatments that could otherwise reduce understory fire risks and improve woodland ecological conditions.

Impacts from Forestry and Woodland Products

Impacts would be the same as those described under Alternative C.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

Impacts would be similar to those under Alternative C, except that fewer acres would be limited to designated routes (972,800 acres), fewer miles of routes would be open to provide access to harvest areas (3,043 miles), and more acres would be closed to motorized vehicle use (1,155,200 acres) under Alternative D. Of all the alternatives, this alternative would result in the greatest access restrictions and the greatest potential for impacts to forestry and woodland resources.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C

4.4.2 Livestock Grazing

This section describes potential impacts on livestock grazing resulting from the implementation of management actions for other resource programs. Impacts on resources and resource uses resulting from implementation of the livestock grazing program are discussed in those particular resource sections of this chapter. Impacts on livestock grazing activities are generally the result of activities that affect forage levels, land use restrictions that affect the ability to construct range improvements, and human disturbance or harassment of livestock within grazing allotments. Conducting vegetation treatments would likely have the greatest effect on livestock grazing, as such treatments could increase vegetation production and forage available for livestock. Activities that result in surface disturbance (e.g., mineral development, ROW construction, and recreation) or management of resources that results in limiting surface disturbance (e.g., fish and wildlife, vegetation, and visual resources) would also impact livestock grazing by affecting forage levels. Management of fire and fuels and forest and woodlands products harvesting would affect livestock grazing by either preserving or increasing available forage for livestock over the long term. Impacts to livestock grazing operations also result from interaction with visitors, access provisions, and other management factors that limit or restrict livestock grazing in certain areas.

Methods and Assumptions

This analysis was based on the following assumptions:

- Livestock grazing would occur throughout the majority of the RFO.
- Livestock grazing would be managed in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration,* and Utah's SRH and *Guidelines for Grazing Management.*
- The type and amount of grazing use would be expected to remain approximately the same.
- Range improvements would continue to occur at current rates to reach rangeland improvement goals.

Impact analyses and conclusions are based on interdisciplinary team knowledge of resources in the RFO, review of existing literature, and information provided by other agencies. Effects are quantified when possible. Spatial analyses were conducted by using GIS data and analyses. Impacts are described by using ranges of potential impacts or in qualitative terms, if appropriate.

Environmental Consequences

Impacts to livestock grazing would likely result from actions proposed under the following resource management programs:

- Soil Resources and Water Resources
- Vegetation and Fire and Fuels Management
- Cultural Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Wild Horses and Burros
- Non-WSA Lands with Wilderness Characteristics
- Livestock Grazing
- Recreation
- Travel Management

- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on livestock grazing. There are no WSA decisions that would impact livestock grazing.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

Implementing appropriate BMPs (Appendix 14) to minimize detrimental impacts that ground-disturbing activities could cause to soils and to maintain or enhance riparian areas (*Utah Riparian Management Policy,* 2005) through project design features or stipulations would help to reduce soil erosion, surface runoff, and sedimentation of streams. This reduction would help to maintain and enhance vegetation and water quality and increase channel stability, indirectly providing forage and water for livestock.

Impacts from Vegetation and Fire and Fuels Management

Management of vegetation resources would generally enhance vegetative conditions and indirectly affect livestock grazing, by increasing forage production. Applying the *Fundamentals of Rangeland Health* under the vegetation management program would help to manage surface uses and thereby enhance rangeland conditions and increase long-term forage production. However, managing rangelands according to the *Fundamentals of Rangeland Health* could also affect livestock operators on those allotments that do not meet standards for reasons attributed to grazing. Such adjustments could include season-of-use changes, forage allocation adjustments, implementation of grazing management practices (e.g., growing season deferment, riparian pastures, or exclosures), forage use limits, or conversions in kind or type of livestock. Management changes such as these could result in increased operating costs to the livestock operator. Over the long-term, achieving the standards would result in increased water availability and forage production, which would benefit livestock through improved animal distribution, increased weight gain and improved animal health.

Treatment of invasive species and noxious weeds would serve to control and contain weed species infestations, thereby maintaining forage production, diversity, and vigor. These actions could temporarily displace livestock and reduce available forage. BMPs for livestock grazing (such as requiring use of weed-free feed) would be implemented to discourage the introduction and spread of weeds.

Conducting vegetation treatments, particularly livestock rangeland treatments, would enhance vegetation conditions and indirectly affect livestock grazing, by increasing forage production. These treatments would have a short-term effect on livestock grazing by removing forage and by excluding livestock use for two growing seasons on treated areas, but enhanced rangeland conditions would be realized over the long-term. Conducting land treatments to reduce soil loss on identified areas and to improve watershed health and implementing erosion control measures in frail watershed areas would help to reduce soil erosion, surface runoff, and sedimentation of water sources and to reestablish grass/forb communities. This management would help to maintain and enhance vegetation conditions and water quality, which would indirectly provide forage and water for livestock.

Alternative N would allow for only limited treatment of vegetation, although a full range of tools (including mechanical, wildland or prescribed fire, and chemical methods) would be available. In the short term, these activities would decrease forage available for livestock use because treated areas are generally rested from livestock grazing for 2 years following the treatments. In the long-term, restoration activities would improve the watersheds and vegetation and provide additional forage for livestock. Areas in which vegetation treatments were not successful could be invaded by weed species or become

reestablished by other undesired vegetation communities, which would reduce available livestock forage over the long term.

In the short term, wildland fires could decrease forage available for livestock use and would require changes in and restrictions to livestock grazing use during emergency fire rehabilitation. (Livestock generally are not grazed in those areas until vegetation is reestablished—generally 2 years.) In the long term, forage quality and quantity available to livestock could potentially increase. Wildland fires could also damage range improvements such as fences, corrals, enclosures, monitoring studies, and above-ground pipelines.

Impacts from Cultural Resources

Activities associated with the management of cultural resources would affect relatively small, localized areas and would not have measurable effects on livestock forage. Mitigating adverse impacts to cultural resources and allowing for preservation and interpretation of such resources could include excavation of known sites, resulting in soil disturbances and forage removal. Restrictions on surface-disturbing activities near cultural sites could prevent the removal of forage in these areas, although it could also result in the modification or relocation of range improvements.

Impacts from Visual Resources

New range improvements, such as structures or vegetation treatments, would be required to meet VRM class objectives. VRM Classes I and II would be aimed at greater retention of existing landscape character than would Classes III or IV. The class designation could affect range-improvement design (functionality and cost) or prohibit the construction of improvements such as pipelines and water storage tanks necessary to properly manage or improve livestock grazing management practices. Under Alternative N, none of the lands managed by the RFO would be classified as VRM Class I; 529,000 acres (25%) would be managed as VRM Class II; 569,000 acres (27%) would be managed as VRM Class III; and 1,029,500 acres (48%) would be managed as VRM Class IV. Areas managed as VRM Class III or IV (75% of the RFO under this alternative) would be subject to actions that allow for greater landscape modification, thus having minimal effects on range improvements.

Impacts from Special Status Species and Fish and Wildlife

Management actions to enhance wildlife habitat could affect livestock grazing by improving vegetation conditions and indirectly maintaining or increasing forage production. However, implementing decisions to increase populations of SSS, implementing conservation measures for listed and sensitive species, and prohibiting or restricting ground-disturbing activities within buffer zones (identified in Appendices 10 and 14) for SSS could also restrict opportunities for range improvements and other grazing management actions.

Management and restoration of native wildlife populations into their historic ranges could have negligible to minor short- and long-term impacts on livestock operations by creating conflict with space, forage use, and water. However, the two activities have mutual goals. Water developments designed to provide new water sources for wildlife would in some situations increase water availability for livestock, promoting improved distribution of both livestock and wildlife.

Reintroductions, transplants, augmentation, and reestablishment of certain wildlife species (e.g., introducing bighorn sheep in domestic sheep range) could eliminate use of livestock in those areas. In addition, complying with the *Desert Bighorn Sheep Management Plan* would preclude converting cattle permits to sheep permits in bighorn sheep habitat (which is located in the eastern portion of the RFO). However, this would have no effect on total acres available for livestock grazing.

Impacts from Wild Horses and Burros

Under Alternative N, 100 AUMs are allocated to burros in the Canyonlands HMA, although no AML is established. These relatively small numbers would pose minimal conflicts with livestock grazing.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no impacts to livestock grazing.

Impacts from Livestock Grazing

Under Alternative N, 138,952 acres would continue to be unavailable to livestock grazing, whereas 1,989,048 acres would continue to be available to grazing. No changes to current grazing management would be proposed. Continued adherence to the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* would result in maintaining plant vigor and increasing litter accumulation, resulting in the maintenance or improvement of organic matter content, soil structure, permeability, productivity, and riparian-wetland function. All of these impacts would provide beneficial impacts to forage production for livestock.

Impacts from Recreation

Recreation activities would continue to directly impact livestock grazing operations through human disturbance, including animal displacement, livestock respiratory problems caused by airborne dust, animal displacement and harassment, and the injury or death of animals caused by vehicle collisions. Cross-country recreational OHV use could damage and remove forage resources and increase dust levels in high-use areas, thereby causing dust to coat forage and subsequently lowering forage palatability. Vandalism to range projects and leaving gates open would also have an impact on livestock grazing operations. These impacts would likely increase over the life of the plan because of the increasing level of visitation in the RFO.

Overall impacts from recreation on livestock grazing would be moderate under Alternative N and would be less intense compared to the other alternatives, which would expand recreational opportunities and place restrictions on types of uses (including motorized access).

Impacts from Travel Management

Generally, the more area that is open to OHV use, the greater the potential for trampling of vegetation, which would reduce the amount of forage available for livestock. Limiting travel to designated routes confines the impacts to areas already disturbed or hardened for vehicle use. Under Alternative N, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing potential impacts to vegetation over a large portion of the RFO; motor vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO; and 214,000 acres (10%) of the RFO would be closed to motorized vehicle use.

Under Alternative N, the most miles of roads would remain open and the least amount would be closed. This alternative would facilitate livestock management by allowing continued access to livestock grazing operations. However, it is expected that visitation to the RFO would continue to grow during the life of this plan. Easy access afforded by the most miles of open roads would allow for increased interaction of the public with livestock and livestock developments (e.g., fences, corrals, and water developments). This would increase the occurrences of livestock harassment, gates being inappropriately left open or closed, and range improvements being damaged.

Providing the greatest miles of roads under Alternative N would also facilitate dispersed visitor use. This use, in turn, would diffuse impacts to livestock and related facilities instead of concentrating such impacts

on particular allotments or areas. Overall, Alternative N would cause the fewest impacts to livestock grazing operations from travel management decisions, compared to the other alternatives.

Impacts from Lands and Realty

Land tenure adjustments (land disposals and acquisitions) would be processed based on specific requests; the demand for these actions is unknown at this time. The loss of public land through land disposals (e.g., Section 203 land sales, exchanges, R&PP patents) could reduce the forage available for livestock use on some allotments. Under Alternative N, 280 acres would be identified for sale. At 8 acres per AUM, this could result in the loss of approximately 35 AUMs, which is less than 1% of the total AUMs available within the RFO. Acquired lands within a grazing allotment would be added to the allotment, but these lands would likely also involve only a small amount of AUMs. Retaining lands in federal ownership (e.g., habitat for listed and candidate species, eligible WSR segments, ACECs) would continue to provide rangelands for livestock in these areas (except where identified as unavailable for grazing).

Construction activities related to the development of land use authorizations (e.g., ROWs, permits, leases, easements) would remove a small amount of vegetation over the short term and would increase the potential for the introduction and proliferation of noxious weeds and invasive species, thereby causing a loss of livestock forage and associated AUMs. Increased vehicle travel on new roads would also increase the potential for the spread of weeds and harassment of and injury to livestock. However, an increase in improved roads could facilitate livestock management operations by increasing access to remote locations within allotments. Under Alternative N, all ACECs (14,780 acres), eligible WSR corridors (12 segments—135 miles), areas closed to leasing from oil and gas (459,700 acres), and areas open to leasing subject to major constraints (NSO) (22,600 acres) would be managed as ROW avoidance areas where none of the aforementioned impacts would occur. Exceptions would be granted only when the proposed authorization would not create substantial surface disturbance or would create only temporary impacts.

Impacts from Minerals and Energy

Surface-disturbing activities associated with the development of leasable, locatable, and salable minerals could disturb soils, remove vegetation, and increase the potential for the introduction and proliferation of noxious weeds, thereby causing a loss of livestock forage and associated AUMs. As specified in Appendix 12, surface disturbance caused by geophysical exploration activities would amount to 5,100 acres (much of it on private lands) and oil and gas development (roads, pipelines, and drill pads) would disturb an estimated 3,080 acres, resulting in a loss of livestock forage in these areas. At 20 acres per AUM, available forage could be reduced by 154 AUMs. However, about 80% of the initial disturbance would be reclaimed within the planning horizon, so only 20% of the disturbed area would be devoid of vegetation for the life of the well. Given that livestock grazing occurs across most of the RFO, the loss of forage in these areas would result in relatively minor impacts to livestock grazing.

Mineral development activities would also increase the potential for livestock harassment and livestock loss from vehicle collisions. However, the improvement of roads associated with mineral development could facilitate livestock management operations by improving access to remote locations within allotments.

Impacts from Special Designations

Wild and Scenic Rivers

Management of river segments to protect their outstandingly remarkable values, free-flowing nature, and tentative classification would include surface use restrictions. Such restrictions would preclude surface disturbance and related forage removal and could help to maintain AUMs for livestock. Under Alternative N, all 12 eligible river segments (135 miles) would receive protection. However, these additional land use restrictions could also increase constraints on options for range improvements. The restrictions on

constructing range improvements within eligible WSR corridors could reduce management options to correct deficiencies in areas that are not meeting RHS, or in meeting other resource objectives. This reduction could lead to reductions in grazing use or changes in season of use.

Areas of Critical Environmental Concern

Alternative N continues the designation of four ACECs (14,780 acres). Two of these ACECs (North Caineville Mesa and South Caineville Mesa) are unavailable for livestock grazing. The feasibility of grazing these areas is questionable, given their difficult access and lack of water. Management of the other two ACECs would have little or no impact on livestock grazing because livestock grazing was not identified as a threat to any relevant or important values, so no special management prescriptions that affect grazing operations would be implemented.

Alternative A

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative N. However, under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 acres annually for all treatments). Although no maximum treatment acreage limits would be set under Alternative N, it is likely that fewer acres would actually be treated under that alternative because it generally mandates full suppression of wildland fires and allows only for limited treatment of vegetation. Additionally, full suppression of wildland fires is not mandated under Alternative A. Increasing the acres of vegetation treated would increase the short-term displacement of livestock following the treatments. Over the long term, increasing treatments would increase and improve vegetation types that are valuable for livestock grazing. However, as there is no requirement to treat a set acreage, there could be no short-term decreases in forage. If little or no vegetation treatments were implemented, the existing active-use AUMs would likely decrease as pinyon-juniper woodlands continued to expand, invading sagebrush steppe vegetation types and reducing understory forage species.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative N, except that under Alternative A most cultural resource sites would be allocated and managed for public use. This allocation would emphasize public education and interpretation of cultural resources, increasing visitation to sites and possibly causing increased conflicts between livestock and people. This conflict would affect only relatively small, localized areas and would not have significant impacts on livestock.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM would be similar to those described under Alternative N, except that more areas would be designated as VRM Classes III and IV (1,681,100 acres, or 79% of the RFO) under Alternative A. Designating more areas in these VRM classes would result in larger areas of moderate-to-major modifications in the existing character of the landscape, thereby reducing impacts on design, construction, and installation of range improvements, compared to Alternative N.

Impacts from Special Status Species and Fish and Wildlife

The types of impacts experienced as a result of SSS management would be similar to those described under Alternative N. However, Alternative A would include additional strategies to avoid or reduce

fragmenting habitat. (Strategies could include employing directional drilling for oil and gas, closing and reclaiming roads, and mitigating the effects of proposed projects that could cause long-term or permanent impacts or losses of habitat.) All these actions would maintain forage cover and reduce forage loss, thus maintaining AUMs for livestock. Alternative A also would include less restrictions on OHV use in crucial wildlife habitats, possibly removing forage resources and increasing dust levels (which could affect palatability of forage) in high-use areas. Alternative A also has less restrictions on surface disturbing activities (e.g., implementation of range improvement projects) within Greater sage-grouse brooding/nesting habitat compared to Alternative N.

Impacts from Wild Horses and Burros

In general, the greater the number of burros, the greater the possibility of adverse impacts on soil resources. Under Alternative A, no AUMs would be allocated to burros in the Canyonlands HMA, and the AML would be set at zero. Keeping the AML at zero would eliminate impacts to soils caused by trampling, compaction, and reduced vegetation cover.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs would be proposed under Alternative A, resulting in no impacts to livestock grazing.

Impacts from Livestock Grazing

The types of impacts experienced as a result of livestock grazing management would be similar to those described under Alternative N, except that an additional 36,950 acres would be available for grazing under Alternative A. This acreage represents only a 3% increase over Alternative N. Although this increase in total available acres is minimal, it could represent lands that would be important to individual livestock operations. Therefore, impacts would be minor areawide but could be moderate in specific areas.

Impacts from Recreation

Under Alternative A, five SRMAs (514,500 acres) would be established to manage recreational use and to mitigate impacts caused by this use, such as uncontrolled camping, parking, and other activities. Management of the Factory Butte SRMA (199,700 acres), Big Rocks SRMA (9,300 acres), and Sahara Sands SRMA (12,300 acres) for motorized use would emphasize this type of recreational opportunity available in the RFO and consequently would increase the potential for livestock displacement, harassment, or injury. However, implementing surface use restrictions within the SRMAs would help to reduce the degree of impact from recreational and other uses. Encouraging primitive types of recreation and prohibiting surface disturbance from oil and gas development and cross-country OHV use in the Dirty Devil and Otter Creek SRMAs would help to reduce effects related to recreational use.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative A would designate 449,000 acres (21% of the RFO) as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; and 0 acres would be closed to motorized vehicle use. The amount of open areas, although greatly reduced as compared to Alternative N, could still result in livestock displacement, harassment, or injury caused by vehicle use in those areas.

Under Alternative A, there would be 4,312 miles of designated routes (slightly more than under Alternative N) and 68 miles of closed routes (only 3 miles less than under Alternative N). This management would facilitate livestock management by allowing essentially unchanged access to livestock grazing operations. As stated previously, it is expected that visitation to the RFO would

continue to grow during the life of this plan. Thus, easy access to the public lands would allow for increased interaction of the public with livestock and livestock developments (e.g., fences, corrals, water developments). This interaction would increase the occurrences of livestock being harassed, gates being inappropriately left open or closed, and range improvements being damaged.

Impacts from Lands and Realty

The types of impacts experienced as a result of lands and realty would be similar to those described under Alternative N, except that Alternative A proposes more acres (13,400 acres) for disposal through FLPMA land sales. At 20 acres per AUM, this increase could result in the loss of approximately 670 AUMs (1% of the total AUMs available within the RFO), which would result in an insignificant impact to livestock grazing. In addition, Alternative A proposes fewer ROW avoidance and exclusion areas (459,700 acres) within which no construction activities related to the development of land use authorizations (e.g., ROWs, permits, leases, easements) would occur. Vegetation would be retained and the potential for the introduction and proliferation of noxious weeds and invasive species (which could cause a loss of livestock forage and associated AUMs) would be minimized in these areas. Within these areas, there would be no new roads that could increase vehicle travel and the potential for harassment of and injury to livestock.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

There would be no impacts to livestock grazing from WSRs because no eligible river segments would be determined suitable. Thus, no segments would be managed to protect outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative A.

Areas of Critical Environmental Concern

Under Alternative A, no areas would be designated as ACECs. Thus, no actions that specifically protect relevant and important values but that could restrict management of grazing would occur, resulting in no impact to livestock grazing.

Proposed RMP

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative A.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative A, except that fewer cultural resource sites would be allocated and managed for public use, thereby decreasing visitation to sites and possibly decreasing conflicts between livestock and people, compared to Alternative A.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under the Proposed RMP, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 249,800 acres (12%) would be managed as VRM Class II; 393,100 acres

(18%) would be designated as VRM Class III; and 1,038,200 acres (49%) would be designated as VRM Class IV. Although the majority of the RFO would be designated as VRM Class III or IV (potentially resulting in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying minimal impacts on range improvements), less of the RFO would be designated in these VRM classes than under Alternative N or A.

Impacts from Special Status Species and Fish and Wildlife

Impacts from SSS management actions would be the same as those described under Alternative A. However, the Proposed RMP has more restrictions on surface disturbing activities within Greater sage-grouse habitat. For example, Alternative A has no stipulation on surface disturbing activities within sage-grouse brooding/nesting habitat, while the Proposed RMP prohibits surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15 and in sage-grouse winter habitat from December 15 through March 14. Limitations on surface disturbing activities within Greater sage-grouse habitat are greater under the Proposed RMP than under any of the other alternatives.

Impacts from fish and wildlife management actions under the Proposed RMP would be similar to those described under Alternative A. However, the Proposed RMP also proposes temporal (winter and/or spring, depending on species) restrictions on surface-disturbing activities (to protect wildlife during critical life stages) and restricts OHV use in deer and elk crucial habitats. These management actions could restrict opportunities for constructing or maintaining range improvements and other grazing management actions.

Impacts from Wild Horses and Burros

Under the Proposed RMP, 600 AUMs would be allocated to burros in the Canyonlands HMA, to meet an AML upper limit of 100. These numbers are greater than under Alternative N or A but less than under Alternative C or D (which establish a herd size of between 120 and 200 head). Because more burros result in a greater possibility of competition for forage between burros and livestock, the Proposed RMP could impact grazing management more than would Alternative N or A but less than would Alternative C or D.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres in 12 non-WSA areas with wilderness characteristics would be protected from impacts that could degrade their wilderness values. Management decisions to protect these values would include prohibiting range projects that would not meet VRM Class II objectives and limiting OHV use to designated routes. These decisions could increase constraints on options for range improvements and decrease opportunities for access to remote locations within allotments. These decisions would make management of grazing operations more difficult.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be similar to those described under Alternative A, except that more lands (860,390 acres) would be established as SRMAs to manage recreational use and to mitigate impacts caused by this use. Under the Proposed RMP, less area would be managed for motorized use; management of the Factory Butte SRMA (24,400 acres) and Big Rocks SRMA (90 acres) for motorized use would emphasize this type of recreational opportunity available in the RFO and consequently would increase the potential for livestock displacement, harassment, or injury. However, implementing surface use restrictions within all or portions of the SRMAs would help to reduce the degree of impact from recreational and other uses. Encouraging primitive types of recreation and prohibiting surface disturbance from oil and gas

development and cross-country OHV use in the Henry Mountains, Dirty Devil, and Capitol Reef Gateway SRMAs would help to reduce effects related to recreational use.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, the Proposed RMP designates only 9,890 acres (less than 1% of the RFO) as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,908,210 acres (90%) of the RFO; and 209,900 acres (10%) would be closed to motorized vehicle use. The amount of open areas, although greatly reduced as compared to Alternative N, would still result in the potential for livestock displacement, harassment, or injury caused by vehicle use in those areas. However, increased restrictions on OHV use would decrease forage loss and decrease dust levels (which could affect palatability of forage) in high-use areas.

Under the Proposed RMP, there would be 4,277 miles of designated routes (3% less than under Alternative N), with 345 miles of routes closed. Therefore, the Proposed RMP could affect livestock management by restricting access to livestock grazing operations substantially more than would Alternative N.

Impacts from Lands and Realty

Impacts from land tenure adjustments (acquisitions and disposals) would be the same as those described under Alternative A.

The types of impacts from land use authorizations would be similar to those described under Alternative N. However, the Proposed RMP proposes more ROW avoidance and exclusion areas (601,800 acres closed to leasing or open to leasing subject to major constraints (NSO), one suitable WSR segment—5 miles, and two ACECs—2,530 acres). Within these ROW avoidance and exclusion areas, no construction activities related to the development of land use authorizations (e.g., ROWs, permits, leases, easements) would remove vegetation or increase the potential for the introduction and proliferation of noxious weeds and invasive species, (which otherwise could cause a loss of livestock forage and associated AUMs). Within these ROW avoidance and exclusion areas there would also be no increased vehicle travel on new roads (which otherwise could increase the potential for harassment of and injury to livestock).

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts from managing WSRs would decrease under the Proposed RMP as compared to Alternative N and increase as compared to Alternative A because only one eligible segments (5 miles) would be recommended as suitable and managed (with surface use restrictions) to protect outstandingly remarkable values, free-flowing nature, and tentative classification. These surface use restrictions would preclude surface disturbance and related forage removal and could help to maintain AUMs for livestock. However, these additional land use restrictions could also increase constraints on options for range improvements.

Areas of Critical Environmental Concern

The Proposed RMP would designates two ACECs (2,530 acres). Both of these ACECs would be unavailable for livestock grazing. The feasibility of grazing the North Caineville Mesa ACEC is questionable, given its difficult access and lack of water. The Old Woman Front ACEC encompasses only

330 acres; its small size would not result in the loss of a significant amount of AUMs, so the overall RFO grazing program would not be affected substantially.

Alternative C

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

The types of impacts experienced as a result of vegetation and fire and fuels management would be similar to those described under Alternative A, although fewer acres would be treated annually under Alternative C (averaging 26,000 annually for all treatments). In addition, Alternative C proposes using only treatment methods that mimic natural processes (e.g., fire, biological, hand cutting), which would likely not be as effective as conventional vegetation treatments and could result in a slower process of vegetation enhancement and related forage increases. Although vegetation conditions described under Alternative A could be reached over the long term, the rate of recovery following individual treatments would likely be reduced under Alternative C. This reduction would increase the time that livestock would be precluded following treatments.

Impacts from Cultural Resources

Impacts would be similar to those described under the Proposed RMP, except that fewer cultural resource sites would be allocated and managed for public use, thereby decreasing visitation to sites and potentially decreasing conflicts between livestock and people, compared to the Proposed RMP.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative C, 446,900 acres (21% of the lands managed by the RFO) would be designated as VRM Class I; 230,600 acres (11%) would be managed as VRM Class II; 509,100 acres (24%) would be designated as VRM Class III; and 941,400 acres (44%) would be designated as VRM Class IV. Although the majority of the RFO would be designated as VRM Class III or IV (which could result in large areas of moderate-to-major modifications in the existing character of the landscape, with accompanying minimal impacts on range improvements), less of the RFO would be designated in these VRM classes under Alternative C than under Alternative N or A or the Proposed RMP.

Impacts from Special Status Species and Fish and Wildlife

The types of impacts experienced as a result of SSS management would be similar to those described under the Proposed RMP. However, limitations on surface disturbing activities within Greater sage-grouse habitat are less under Alternative C than under the Proposed RMP.

The types of impacts experienced as a result of fish and wildlife management would be similar to those described under Alternative A. However, Alternative C would propose restricting surface disturbance or surface occupancy within 660 feet of riparian areas (compared with 330 feet under Alternative A), includes more restrictions on OHV use in crucial wildlife habitats, and designates an ACEC in the Henry Mountains (288,200 acres) for the protection of wildlife values. These additional land use restrictions would further help to improve vegetation conditions and increase forage production but could also increase constraints on options for range improvements.

Impacts from Wild Horses and Burros

Under Alternative C, 1,200 AUMs would be allocated to burros in the Canyonlands HMA to meet an AML upper limit of 200. These numbers are greater than under Alternative N or A or the Proposed RMP.

Because more burros result in a greater possibility of competition for forage between burros and livestock, Alternative C could impact grazing management more than would Alternative N or A or the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs would be proposed under Alternative C, resulting in no impacts to livestock grazing.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be similar to those described under the Proposed RMP, except that under Alternative C, more lands (930,000 acres) would be established as SRMAs to manage recreational use and to mitigate impacts caused by this use, and no areas would be managed for motorized use. This management would decrease the potential for livestock displacement, harassment, or injury. Encouraging primitive types of recreation and prohibiting surface disturbance from oil and gas development and cross-country OHV use in all of the SRMAs would help to reduce effects related to recreational use.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative N. However, Alternative C designates no acres as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,445,000 acres (68%) of the RFO; and 683,000 acres (32%) would be closed to motorized vehicle use. This alternative would therefore limit the potential for livestock displacement, harassment, or injury caused by vehicle use to those areas designated as limited. Increased restrictions on OHV use would also decrease forage loss and decrease dust levels (which could affect palatability of forage) in high-use areas.

Under Alternative C, there would be 3,192 miles of designated routes (26% less than under Alternative N), with 1,188 miles of routes closed (18 times the amount closed under Alternative N). This management could affect livestock management by restricting access to livestock grazing operations substantially more than would Alternative N.

Impacts from Lands and Realty

Under Alternative C, no lands would be identified as available for FLPMA land sales. Thus, no AUMs would be lost because of this type of lands action.

The types of impacts caused by land use authorizations would be similar to those described under Alternative N. However, Alternative C proposes more ROW avoidance and exclusion areas (735,000 acres closed to leasing or open to leasing subject to major constraints [NSO], 12 suitable WSR segments—135 miles, and 16 ACECs). Within these ROW avoidance and exclusion areas, no construction activities related to the development of land use authorizations (e.g., ROWs, permits, leases, easements) would occur. Thus, vegetation would be retained in these areas and the potential for the introduction and proliferation of noxious weeds and invasive species (which could cause a loss of livestock forage and associated AUMs) would be minimized. Within these ROW avoidance and exclusion areas, there would also be no new roads that could increase vehicle travel and the potential for harassment of or injury to livestock.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wild and Scenic Rivers

Management of river segments to protect their outstandingly remarkable values, free-flowing nature, and tentative classification would include surface use restrictions. Such restrictions would preclude surface disturbance and related forage removal and could help to maintain AUMs for livestock. Under Alternative C, all 12 eligible river segments (135 miles) would be recommended as suitable and would be managed (with surface use restrictions) to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. These surface use restrictions would preclude surface disturbance and related forage removal and could help to maintain AUMs for livestock. However, these additional land use restrictions could also increase constraints on options for range improvements.

Areas of Critical Environmental Concern

Alternative C designates 16 ACECs (886,810 acres). Portions of the Badlands ACEC (North and South Caineville Mesas) are already unavailable for livestock grazing in the current LUP; the feasibility of grazing these areas is questionable given their difficult access and lack of water. Old Woman Front ACEC encompasses such a small area (330 acres) that prohibiting grazing would not result in the loss of a significant amount of AUMs, so the overall RFO grazing program would not be substantially affected. Of the remaining ACECs, three (Dirty Devil, Henry Mountains, and Little Rockies) preclude converting cattle permits to sheep permits. However, this preclusion would have no effect on total acres or AUMs available for livestock grazing because cattle could still be grazed.

Allowing no uses that would cause irreparable damage to the relevant and important values in the ACECs would preclude surface disturbance and related forage removal and could help to maintain AUMs for livestock. Such decisions could include closing the areas to OHV use; managing the areas as either closed to leasing or open to leasing subject to major constraints (NSO), depending on the ACEC; and designating the areas as VRM Class II. However, these additional land use restrictions could also increase constraints on options for range improvements and access to allotments for management purposes.

Alternative D

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

The types of impacts experienced as a result of VRM decisions would be similar to those described under Alternative N. Under Alternative D, 1,129,600 acres (53% of the lands managed by the RFO) would be designated as VRM Class I; 66,700 acres (3%) would be designated as VRM Class II; 355,100 acres (17%) would be designated as VRM Class III; and 576,600 acres (27%) would be designated as VRM Class IV. With the majority of the RFO designated as VRM Classes I and II (where the existing character of the landscape must be preserved or maintained), the ability to implement range improvements would be precluded or constrained, thus potentially affecting the ability to treat vegetation (and improve forage condition) or to construct improvements for distribution of livestock.

Impacts from Special Status Species and Fish and Wildlife

Impacts would be similar to those described under Alternative C, except that there would be additional restrictions on motorized use in deer, elk, and bison habitat under Alternative D. These restrictions would increase constraints on access to allotments for management purposes.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, non-WSA areas with wilderness characteristics would be protected from impacts that could degrade their wilderness values. Management decisions to protect these values would include prohibitions on range projects that would not meet VRM Class I objectives (including construction of new fences, water structures, and other facilities that may be needed for proper livestock distribution) and closing the areas to OHV use. These prohibitions could increase constraints on options for range improvements and decrease opportunities for access to remote locations within allotments. These decisions would make management of grazing operations more difficult.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be similar to those described under Alternative C, except that Alternative D would establish more lands (1,358,100 acres) as SRMAs to manage recreational use and to mitigate impacts caused by this use; none of these areas would be managed for motorized use. This management would decrease the potential for livestock displacement, harassment, or injury. Encouraging primitive types of recreation and prohibiting surface disturbance from oil and gas development and cross-country OHV use in all of the SRMAs would help to reduce effects related to recreational use.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. However, Alternative D designates 972,800 acres (46% of the RFO) as limited to designated routes and 1,155,200 acres (54%) as closed to motorized vehicle use. More than any other alternative, Alternative D would limit the potential for livestock displacement, harassment, or injury from vehicle use. Increased restrictions on OHV use would also decrease forage loss and dust levels (which could affect palatability of forage) in high-use areas.

Under Alternative D, there would be 3,043 miles of designated routes (the least of any alternative), with 1,242 miles of routes closed (the most of any alternative). This management could affect livestock management by restricting access to livestock grazing operations substantially more than any other alternative would.

Impacts from Lands and Realty

Impacts from land tenure adjustments would be the same as those described under Alternative C.

The types of impacts from land use authorizations would be similar to those described under Alternative N. However, Alternative D proposes more ROW avoidance and exclusion areas (1,203,800 acres closed to leasing or open to leasing subject to major constraints [NSO], non-WSA lands with wilderness characteristics, 12 suitable WSR segments, and 16 ACECs). Within these ROW avoidance and exclusion areas, no surface-disturbing activities related to the development of land use authorizations (e.g., ROWs,

permits, leases, easements) would occur. Thus, vegetation would be retained in these areas and the potential for the introduction and proliferation of noxious weeds and invasive species would be minimized, causing no loss of livestock forage and associated AUMs. Within these ROW avoidance and exclusion areas, there would also be no new roads that could increase the potential for harassment of and injury to livestock from motorized vehicles.

Impacts from Minerals and Energy

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative C; the same ACECs are designated in both alternatives. However, management prescriptions of some ACECs would be more restrictive under Alternative D. For example, under Alternative D, all non-WSA lands with wilderness characteristics within the ACECs would be designated as closed to OHV use and would be designated as VRM Class I. This designation could increase constraints on options for range improvements as well as decrease opportunities for access to remote locations within allotments, compared with Alternative C.

4.4.3 Recreation

This section presents potential impacts on recreation resources, opportunities, and experiences from management actions for other resource programs. Recreation uses within the decision area include backpacking, recreational OHV use, hiking, camping, sightseeing/viewing nature, hunting, fishing, mountain biking, rock climbing, and horseback riding. Impacts could occur through potential changes to visitor preferences (activities, experiences, benefits), recreation setting conditions (physical, social, administrative), recreation management (resources, signing, facilities), recreation marketing (visitor services, information, interpretation and environmental education), recreation inventory and monitoring, and recreation administration (permits, fees, visitor limits and regulations). These recreation features are interrelated and connected to access. For example, changes in recreation settings would result in corresponding changes in the opportunities to achieve desired recreation experiences and associated benefits. These opportunities and benefits are influenced by access.

Recreational experiences and the potential attainment of a variety of beneficial outcomes are vulnerable to any management action that would alter the settings and opportunities in a particular area. Recreation settings are based on a variety of attributes, such as remoteness, the amount of human modification in the natural environment, evidence of other users, restrictions and controls, and the level of motorized vehicle use. Management actions that greatly alter such features within a particular portion of the planning area could affect the capacity of that landscape to support appropriate recreation opportunities and beneficial outcomes.

Methods and Assumptions

The analysis is based on the following assumptions:

- Recreation use within the planning area will continue to increase during the life of the plan.
- The incidence of resource damage and conflicts between recreationists involved in motorized and non-motorized activities will increase with increasing use of public lands.
- The existing transportation network will be sufficient to meet the demand of recreational OHV opportunities.
- There will be sufficient opportunities to meet the demand for non-motorized recreation (e.g., hiking, mountain biking, equestrian).
- Demands for all types of recreation experiences will increase—particularly demands for semi-primitive motorized, semi-primitive non-motorized, and primitive recreation.
- Demand for Special Recreation Permits (SRP) will increase during the life of the plan.

Impact analyses and conclusions are based on interdisciplinary team knowledge of resources in the RFO, review of existing literature, and information provided by other agencies. Effects are quantified when possible. In absence of quantitative data, best professional judgment was used. Spatial analyses were conducted using GIS data and analyses. Impacts are described using ranges of potential impacts or in qualitative terms, if appropriate.

Environmental Consequences

Impacts to recreation would likely result from actions proposed under the following resource programs:

- Water Resources
- Vegetation and Fire and Fuels Management
- Visual Resources
- Special Status Species

- Fish and Wildlife
- Wild Horses and Burros
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on recreation. There are no WSA decisions that would impact recreation.

Alternative N: No Action

Impacts from Water Resources

Decisions proposed for water quality and the protection of groundwater would also benefit recreational uses by maintaining the quality and quantity of public water sources and natural springs. Maintaining a 500-foot buffer zone of no surface disturbance and/or occupancy around natural springs would continue to restrict commercial permit holders from camping in these areas. General recreation visitors would also be displaced where fencing is constructed to maintain these buffer zones. However, in most cases there are adequate opportunities for camping away from natural springs. The impacts from potential displacement would range from negligible to minor. In the long term, recreational opportunities such as birding and hunting could be enhanced because habitat within the buffer zone and water quality would be improved.

Impacts from Vegetation and Fire and Fuels Management

Depending on the type, scope, and intensity, vegetation treatments and fire and fuels management could directly impact recreation settings and the associated visitor experiences as well as the possible realization of specific benefits. Impacts in treated areas could range from negligible to moderate. The duration of the impacts would be dependent on the type of treatment being applied as well as the acreage and success of ESR treatments. In the long term, managing vegetation resources to achieve *Fundamentals of Rangeland Health* and desired vegetation conditions, including the control of noxious weeds, invasive species, and insects, would improve the condition of the landscape and enhance recreation experiences and settings. Vegetation treatments would also indirectly improve wildlife-related recreation opportunities as a result of improved wildlife habitat.

Impacts from management activities in riparian areas, specifically buffer zones along streams, would be the same as discussed for this alternative in Impacts from Water.

Impacts from Visual Resources

Managing the RFO according to VRM classes could impact recreation experiences depending on the VRM class assigned and the experience desired. Any new facilities, new types of commercial activities, or other surface-disturbing activities would be analyzed on a case-by-case basis and would be required to meet VRM objectives or be relocated.

Under this alternative, 529,500 acres (25% of the lands within the RFO) would continue to be managed to meet VRM Class II objectives. The character of the landscape would be maintained in these areas and enhance the recreation experience, especially for those users seeking a more undeveloped setting. Some projects could still be allowed that could result in localized impacts to the landscape and thus the recreation experience, which would range from negligible to minor, depending on the type of project.
